‘In support of his claim, this buddy of mine showed me how, by moving and rotating the lines of the drawing, the acronyms “CIA” and “AD” could be formed, the latter representing the initials of Allen Dulles, present head of the CIA. My buddy also showed me that the parabolic arc above the arrow, or inverted V, could represent a stylised cross-section of the body of the flying saucer – or a pressure wave – while the arrow, or inverted V, with a line under it, could indicate that a vertical thruster is located centrally in the fuselage, or circular wing. Finally, he knocked me sideways by stating that the placing of the symbol on the side of the vehicle – just above the thruster orifice on its underside – could be a warning that the thruster is located there; while the use of red for the symbol could be a danger sign, just as it is with contemporary aircraft symbols.’

Scaduto straightened up in his chair, looking pleased with himself.

‘So where is this leading?’ Epstein asked in his quiet, patient manner.

‘The implication,’ Scaduto said, ‘is that the Socorro sighting was of a highly sophisticated, piloted, vertical-ascent-and-descent, man-made aircraft that had flown from, and returned to, somewhere in the White Sands Proving Ground.’

For a considerable period of time there was silence in the room, broken only by the soft drumming of Epstein’s fingers on the desk. Eventually he took a deep breath and said, ‘Man-made flying saucers?’

‘Yes. Constructed in the United States, most likely in the White Sands Proving Ground.’

‘But do you believe those flying saucers can account for all the sightings we’ve had since World War Two?’

‘No,’ Scaduto said. ‘But they sure as hell could account for the many stories of flying saucers being held in top-secret hangars in US Air Force bases.’

‘And the other ones? The technologically superior ones? The so-called mother ships?’

Scaduto shrugged. ‘I don’t know.’

‘Well,’ Epstein said after some thought, ‘although the APII has, up to now, carefully avoided all so-called “occupant” cases, in this instance, given Deputy Marshal Zamora’s reliability as a witness, and because Project Blue Book is listing the case as a genuine unidentified, I think we should – how shall I put it? – *liberalise* the organisation by including occupant cases in the future. I myself will avoid the man-made flying saucer hypothesis, but if you gentlemen wish to pursue it, by all means do so. In the meantime, I think we should use the latest Socorro sighting as leverage to press again for Congressional hearings.’

‘Good idea,’ Dwight said.

Sitting behind his desk, wearing an English tweed jacket and grey pants, with striped shirt and tie, his hair still plentiful even if turning grey, as was his short, pointed beard, Dr Epstein looked older than his age. After massaging his forehead, he sighed and glanced from Scaduto to Dwight.

‘Well, gentlemen, I guess that’s it for the day. It’s a lot for one day.’

‘You want to join us for lunch?’ Dwight asked him. ‘I’m having a light lunch with Tony here, before catching the plane back to Dayton.’

Epstein glanced at the mass of papers on his desk, then raised and lowered

his hands in a rabbinical gesture – or simply one of weariness. ‘I can’t. The Socorro incident has brought the work in and my desk, as you can see, is already overburdened. Besides, when I get tired I can’t eat – and I certainly can’t take a drink at lunchtime – so I’ll take a rain check.’

‘You’re sure?’

‘Yes, I’m sure.’

Dwight and Scaduto pushed their chairs back, then Dwight leaned over the desk to shake Epstein’s hand. ‘Until the next time.’

‘Have a good lunch and a pleasant flight home,’ Epstein said.

Scaduto just waved his hand and sauntered out of the office ahead of Dwight. Once on the sidewalk outside the building, they took a cab the short distance to Clyde’s garden restaurant in M Street, Georgetown, near to where Bob Jackson had died, possibly murdered. Recalling that dreadful event, Dwight felt a spasm of grief combined with rage and decided that he needed a stiff drink. When they were seated in Clyde’s, packed with the usual lunchtime crowd, a bedlam of genial conversation, Dwight ordered a large bourbon. Scaduto had beer. Throughout the lunch they talked non-stop about UFOs in general and the recent Socorro Incident in particular, growing more excited every minute. This did not help Dwight to forget that his good friend, Bob Jackson, had died, or more likely had been murdered, just a little farther along the street. No way in the world would Dwight ever believe that Bob had died of a heart attack.

Eventually, when they had finished the lunch, settled the check and were preparing to leave, Scaduto said: ‘I’m telling you, Dwight, I still believe the UFOs are man-made and probably originate from both Canadian and American top-secret establishments, notably in the White Sands Proving Ground.’

‘I’m still not sure of that,’ Dwight confessed, as they made their way out of the packed garden restaurant, through the indoors bar, then back into M Street.

‘Don’t forget,’ Scaduto continued, unperturbed, as they stood on the busy sidewalk, observing the passers-by, many of them exuberant students from Georgetown University, ‘that the Brits have already demonstrated a vertical-take-off aircraft using swivelling jet nozzles – the *Hawker P1127*. And laser-beam technology – often included in UFO reports, though generally treated as pure science fiction – has been making incredible advances since its

discovery four years ago by the Hughes Aircraft company in California. So the capabilities of the flying saucers reported are definitely moving into the area of the possible. The saucers *could* be man-made!'

'But some of the saucers are really so far advanced that I find it difficult to believe they could be man-made.' Dwight glanced automatically along M Street, towards Canal Road, and found himself trying to imagine what had happened to Bob Jackson that fateful night of his death. This in turn led him to another line of thought. 'Take Beth's experience, for instance. The one she recounted under hypnosis. That wasn't a dream – it was a real experience – and the technology suggested by her recollections had to be pretty stupendous. The beams of light from the small saucers somehow immobilised her car, then magically drew it into the mother ship. The beams of light from the mother ship disorientated her and temporarily paralysed her. Then, of course, when she was inside the mother ship, she was shown... *Earth and the stars*.'

'Yeah,' Tony said, softly, in wonder, 'she saw the damned stars!'

'That mother ship was out there in space,' Dwight continued. 'I can't imagine man-made aircraft, or spacecraft – flying saucers or other kinds – being capable of that, if based on the known technology.'

'Why not?' Scaduto responded. 'Our astronauts have been in space. Certain of our conventional aircraft can now reach the stratosphere. And according to Beth, the guy with the oddly expressionless face told her to warn you off the search for, quote, *man-made flying saucers*... And now this flying saucer sighting at Socorro, New Mexico, seems to prove conclusively that whatever Deputy Marshal Zamora saw, it was certainly real enough and piloted by two small males wearing white coveralls... No planes in the air at the time, no weather balloons... It was *real*, Dwight. It left burn marks and depressions in the soil. It was *physical*... So where the hell did it come from?'

'I don't know,' Dwight confessed. 'I only know this... I'm frightened for Beth and Nichola. I'm even frightened for myself. So if I continue to work for Epstein, I've got to do it off the record and you've got to cover the more public sightings. You've got to cover *for me*.'

'No sweat,' Scaduto said.

The two men shook hands on the crowded sidewalk, then went their separate ways.

Chapter Thirty-Eight

Stopping his car in the middle of the desert between Las Vegas and Nellis Air Force Base in the dead of night, Fuller lit a cigarette, inhaled gratefully, blew a cloud of smoke, and realised that he wasn't looking forward to this particular meeting with Wilson.

For the past year, ever since Wilson had called a meeting to angrily discuss the so-called Socorro Incident, when a USAF flying saucer, based on the *Kugelblitz I*, and its two-man crew had been spotted by Lonnie Zamora, Fuller had been having regular, mostly unpleasant meetings with Wilson, who had expressed his concern about the resurgence of public interest in UFOs generated by the Air Force's carelessness in letting one of their flying saucers from the White Sands Proving Ground be seen by a widely respected Deputy Marshal.

Indeed, the Socorro Incident of 1964 had become in the collective mind of the public the most fascinating UFO sighting since the original Socorro case of 1947. Approximately a year later, on June 12, 1965, one of Wilson's own, smaller flying saucers had crashed near Nellis AFB, right here in Las Vegas, Nevada. The saucer and dead crewmembers had been taken into a top-secret research laboratory on the base for examination. That was two weeks ago.

Demanding the release of the remains through Fuller, Wilson had been refused and, at a later meeting, had coldly told Fuller to inform his superiors at CIA Headquarters, Langley Field, Virginia, and in the White House and Pentagon, that he would be taking 'retaliatory' measures.

Knowing that Wilson was capable of inflicting great damage on the United States, Fuller had conveyed his message to the Pentagon. Unfortunately, because of the speedy advances being made on their own flying saucer projects at Avro-Canada in Malton, Ontario, and at other top-secret research establishments in the White Sands Proving Ground and elsewhere in New Mexico and Arizona, the top brass of the Air Force were growing arrogant,

believing that they could outflank Wilson, and so refused to hand over the invaluable debris of Wilson's vastly superior crashed saucer.

Now, as he glanced up and saw what appeared to be a star rapidly growing bigger in a black sky flooded with stars, Fuller was preparing to convey this second refusal to Wilson. He didn't look forward to it.

On the other hand, as he realised when he glanced back over his shoulder and saw the neon spires and minarets of Las Vegas soaring out of the vast desert darkness, this was where Elvis Presley had made his latest movie, *Love in Las Vegas*, also known as *Viva Las Vegas*. Fuller loved Elvis. Elvis was a great American. Fuller also loved Ann-Margret who, when she performed with Elvis in the recently released movie, had almost made Fuller cream his pants.

Amazing, he thought, the things I get to see doing this job. Here I am, metaphorically speaking, walking in the footsteps of Elvis and Ann-Margret. No wonder I love my country. Where else could you do this?

Turning away from the sparkling, high-rise, neon splendours of distant Las Vegas, he stuck his head out of the open window of the car and looked up again.

The expanding star grew bigger, until it became dime-sized, then like a weather balloon, and finally, with startling speed, a large, saucer-shaped dark mass surrounded by a pulsating whitish glow. Seeming to widen as it descended, until it was immense, almost blotting out his entire view of the night sky, it stopped abruptly and hovered directly above him. Then, as if sensing the presence of his car below it – which in fact, as Fuller knew, it had – it glided slowly sideways, all 250 feet of it, stopped where it could not damage his car, then dropped lower again, its whitish glow dimming more with each second of its stately descent.

Eventually it settled gently on the ground, its nearest edge about fifty yards from Fuller's car. The whitish glow faded away, the lights flashing around its rim then blinked out, one after the other, in rapid sequence, and finally it was just a vast, silvery-grey, dome-shaped mass, eerily beautiful in moonlight.

Fuller was, of course, used to the sight of Wilson's extraordinary flying saucers (he rarely thought of them as UFOs) and, to a certain degree, now took them for granted. He therefore waited patiently for the seamless panel in the outer body to move outward and down, forming a doorway into the holding bay and a ramp that led from there to the ground. He did *not* wait

patiently when the unmistakable form of Wilson was framed in that brilliant light, but instead slipped smartly out of the car and advanced to meet him.

The knowledge that he, Jack Fuller, the fearless, could be frightened of Wilson filled him with nausea. Nevertheless, approaching Wilson, meeting him halfway, Fuller was able to maintain his outward appearance of sardonic pragmatism.

'Mr Wilson!' he exclaimed softly, by way of greeting.

Wilson's hair was silvery-white but abundant. His face was lean and handsome, with piercing sky-blue eyes and slightly odd, almost immobile features. That, Fuller knew, was due to plastic surgery, though he wouldn't have dared mention the fact.

Wilson nodded. 'Fuller.' His face was as near to grim as his normally expressionless face would allow. 'Let's waste no time in idle conversation. You know why I'm here. Do I get my crashed saucer back or not?'

Fuller spread his hands in the air, indicating that he had come empty-handed.

'They said "No"?'

''Fraid so.'

'That was foolish of them.'

'The military mind can be foolish at times.'

'I do not require your facetiousness, Fuller.'

'Sorry.'

'What did they find in the wreckage?'

'Crewmembers. Very strange, I'm told. Someone used the word "cyborgs", which was new to me at the time, though I've since been familiarised. All dead, of course.'

Wilson offered a chilling smile. There was a certain aspect to Fuller's bottomless pool of corruptibility, cynicism and blind patriotism that amused him. The crass stupidity of the majority of the human race, but in this case combined with low cunning, was exemplified in Fuller. The CIA agent, Wilson realised, had grandiose ideas about himself. Well, time would teach him...

'You're not too far from being a cyborg yourself,' Wilson said in a rare demonstration of cynicism, which was, after all, a human attribute.

'That sounds facetious, Mr Wilson.'

'You don't like to be put down. You have the need to prove yourself. These

are admirable traits in a child, but you should have risen above them. Still, you are what you will be – which is not much at all – and I will therefore, willy nilly, be forced to accept this and deal with it. You're a message boy and I treat you as such by asking one question: Your *superiors* said "No"?'

'Yes, they said "No".'

'You *do* realise, I take it, that I could go into that Air Force base and take what I want without a problem.'

'Without a short-term problem,' Fuller replied, taking as much satisfaction as he could from this conversation, which wasn't, in his view, all that much. 'But in the long term it wouldn't do you much good. By which I mean that the use of force would only draw attention to that secret hangar in the base. And the more – how shall I put it? – the more *unusual* the method of your assault, the more attention it would subsequently receive in the media. Which isn't, if I may say so, exactly the kind of attention you want.'

'What a clever man you are, Mr Fuller.'

'Gee, thanks, Mr Wilson.'

Wilson ignored the nervous sarcasm. 'Why do they want to keep my saucer and its dead crewmembers?'

'Because your saucer is more advanced than their own and the nearest we've come to workable cyborgs are fairly basic Cybernetic Anthropomorphous Machine Systems, or CAMS.'

'I'm surprised you could pronounce that.'

'I have my moments.'

'So they're no longer satisfied with what I've already given them. They think they can *steal* my technology and, perhaps, catch up with me.'

'I'm afraid that's the case, Mr Wilson. It's the nature of the beast to grow arrogant and turn on its master.'

Wilson seemed to sigh, though that was unlikely. 'Well, I'm sorry to hear that, Mr Fuller, because I had hoped to avoid unpleasantness. Now, alas, I'm going to have to teach the White House and the Pentagon a lesson they won't easily forget.'

Not being as stupid as his superiors when it came to an assessment of Wilson's powers, Fuller had feared that this was how he would react – and feared even more what he might do. 'What lesson would that be, Mr Wilson?'

Again, when Wilson smiled, the effect was chilling. 'I'm going to black out

most of the East Coast of the United States. A *total* blackout, Mr Fuller. If, by the first week in August, I do not have my crashed saucer back, I will begin the process of turning out all the lights. I will do this gradually, bit by bit, to give you time to change your minds. But if, by November, you're still holding my crashed saucer and dead cyborgs, every light on the east coast will go out.'

'Every single light on the East Coast of America?'

'Yes. Every single light. Now take that message back to your superiors and, if they still refuse my request, keep your eye on events during the first week of August. Goodnight, Mr Fuller.'

Fuller returned to his car and sat in it until the enormous, majestic flying saucer ascended vertically, then abruptly shrank to the size of a star and shot off to the east. Then, feeling chilled by Wilson's warning, he drove straight back to Las Vegas airport and caught the first plane back to Washington DC.

When he had conveyed Wilson's message to the White House and the Pentagon, via CIA Headquarters in Langley Field, Virginia, they refused to believe that Wilson could do what he was threatening. They all thought he was bluffing.

The following week, the first week in August, 1965, Fuller asked the Langley Field press-cutting department to send him reports on any unusual stories regarding power lines or electricity generators. In fact, even before the first cuttings had been received, he knew that Wilson's game was starting when one of his CIA physicists, engaged in an intelligence study of the relationship between UFOs witnessed over power lines and subsequent, inexplicable power failures, submitted an unusual report.

During the first week of August, thousands of citizens in Texas, Oklahoma, Kansas, Nebraska, Colorado and neighbouring states witnessed one of the biggest UFO displays ever. Unidentified lights flew across the skies in formation, were tracked on radar, and played tag with civilian and Air Force aircraft. Reading the written reports of hundreds of witnesses, Fuller thought the descriptions of the lights were strikingly similar to those he had received about the Nazis' World War II *Feuerballs*.

As Fuller subsequently found out from his daily perusal of the relevant press cuttings, this unexpected major display of UFOs ended abruptly a week later.

During the evening of the first day in which the UFOs had *not* been seen,

when in bed with the most recent of his nubile girlfriends – he liked them young these days – Fuller was shocked to receive a personal phone call from Wilson.

'I didn't know you had my home phone number,' Fuller said, trying to hide his feeling of violation at close to midnight.

'I have everything on you,' Wilson replied, 'including every last detail of the blonde creature lying beside you, just about legal age.'

Now almost sweating, wondering where the hell Wilson was speaking from and wondering just what he had seen of his frolics with the nubile, jailbait blonde, Fuller said, fighting to keep his voice steady, 'So what do you want at this time of night?'

'I want to know if the ambitious morons above you have seen enough and are willing to return my crashed saucer and its dead cyborgs.'

'I'm really sorry to have to say this,' Fuller replied, feeling even more sorry for himself, 'but the ambitious morons above me are acting like just that – morons. They're insisting that the recent UFO flap was purely accidental.'

'Then they are truly moronic.'

'Well,' Fuller said, trying to recover his equilibrium and act cool for the benefit of the nubile blonde beauty stretched out beside him, looking seriously puzzled, 'as they said, what you threatened didn't actually happen: the lights didn't go out.'

'I told you I would give them a chance to change their minds before I went further.'

'They thought you were bluffing.'

'Then I'll show them otherwise,' Wilson said, 'and I'll do it in the middle of winter, to cause even more chaos.'

'That's three months away,' Fuller reminded him.

'I'm sure you can wait that long. Goodnight, Mr Fuller.'

Fuller carefully put his phone back in its cradle, rolled over to the blonde and slithered onto her naked, sweat-slicked body like a snake in a swamp. Attaining an instant erection, he slipped it into her and whispered, 'How long do you think we can keep this up? Does three months sound good?'

The remark was, he soon realised, a very poor joke designed to quell the unexpected, uncustomary fear that was making his stomach churn. He knew the joke hadn't worked when the fear, crawling through him like a ghostly, malignant presence, made him lose his erection before he could properly use

it.

This had never happened to him before, but then he'd never known fear before.

He would have to get used to it.

Three months later, on the night of November 9, 1965, hundreds of UFOs, most in the form of darting lights, were reported from Niagara, Syracuse, and Manhattan. That same night, all the lights went out – in Connecticut, Massachusetts, Maine, New Hampshire, New Jersey, New York, Pennsylvania, Vermont, and a section of Canada. They went out over a total area of 80,000 square miles and a population of twenty-six million people. The biggest power cut in American history, it caused chaos and panic.

Even while this blanket of darkness was falling over the land – and was already being dubbed the Great Northeast Blackout – Fuller was on the phone at CIA headquarters in Langley Field, Virginia, trying to find out what had caused it. He learnt that the huge power grid that controlled all of the blacked-out areas – an interlocking network linking twenty-nine utility companies, with hundreds of automatic controls and locking devices – had always been considered to be invulnerable... yet the system *had* failed and the cause of the black-out couldn't be ascertained.

The only thing known for certain at this point in time was that the failure had occurred *somewhere* in the flow between the Niagara Falls generators and the Clay power sub-station, an automatic control unit through which the electric power flowed from Niagara to New York.

Shortly after Fuller had digested this report, he received a call from a CIA friend, Dick Lamont, at Andrews Air Force Base.

'There's a UFO connection,' Lamont said.

'What kind?'

'The first report of an unidentified,' Lamont told him, 'was made by the Deputy Aviation Commissioner of Syracuse, Robert C. Walsh, and several other witnesses. Just after the power failed at Syracuse, all of them saw what resembled a huge fireball *ascending* from a fairly low altitude near Hancock Airport. Approaching for landing at that time was flight instructor Weldon Ross and his passenger, computer technician James Brooding, both of whom saw the same object. At first they mistook it for a burning building on the ground – something corroborating the fact that the fireball was at low altitude

– but then they realised that it was something in the air... a single, round-shaped object about a hundred feet in diameter, later described in their formal report as a "flame-coloured globe". And according to Ross's calculations, that object was directly over the Clay power sub-station...'

No sooner had Fuller put the phone down than it rang again. This time it was Wilson.

'Well?' he asked softly.

'I have to talk to the President,' Wilson replied.

'You do that,' Wilson said.

A few hours later, at 3.30 in the morning, after his 'emergency' telephone conversation with President Lyndon B. Johnson, Fuller was landing by helicopter in the most heavily guarded area of Nellis AFB, Las Vegas, Nevada. Two crude coffins and a pile of large wooden crates had already been loaded onto a caravan of US Army trucks, which were surrounded by a ring of heavily armed troops. Fuller clambered into the back of a diplomatic limousine and told the driver to go. The limousine, which had tinted, bulletproof windows, led the convoy of trucks away from the floodlit hangar to a restricted airstrip at the northern edge of the base.

Clambering out of the limousine, Fuller glanced about him and noted that the whole area was surrounded by barbed wire and protected by more helmeted, armed troops. Satisfied with the security arrangements, he supervised the unloading of the two coffins and crates. When they were unloaded and forming one large, pyramid-shaped heap in the middle of the airstrip, the armed soldiers were ordered into the trucks and driven back to camp, leaving Fuller alone with a high-ranking Air Force officer.

Not intimidated by high-ranking Air Force officers, Fuller lit a cigarette and smoked while he waited.

Eventually, one of Wilson's mother ships descended silently, majestically, a great pyramid of steel cocooned in a white haze, its rainbow lights flashing rapidly around its circular rim, to settle just above the field at the far side of the runway. When it had landed, the lights flickered off, one after the other in quick sequence, the white haze disappeared, as if the light had been sucked back in through the porous metal of the saucer's body, and then a large, formerly seamless panel moved outwards and down to form a doorway with a wide ramp leading from the holding bay of the saucer to the ground.

At first seen as no more than a sharp-edged silhouette in the dazzling light

of the holding bay, Wilson's assistant, Salvatore Fallaci, became recognisably human as he advanced down the ramp and approached Fuller, now just getting out of his limousine.

As Fuller noted instantly, Wilson was not present. Instead, Fallaci was surrounded by four creatures who could have been easily mistaken for aliens, or extraterrestrials, but were, as Fuller now knew, cyborgs surgically mutated from what had once been normal human beings: the small Ache Indians of Paraguay. Averaging five feet tall, sometimes even smaller, only occasionally taller, they'd had facial surgery to replace the nose, mouth and throat with metal-covered prosthetics. While this alone would have made them look bizarre, they were rendered even more 'alien' by their remote-controlled metal hands, which were actually small CAMS of the kind used for sea-bed exploration.

The children of Frankenstein, Fuller thought. That's who I'm dealing with. That fucker Wilson is Frankenstein.

'Good evening, Mr Fuller,' Fallaci said.

'More like good morning,' Fuller responded.

Fallaci smiled. He had that Italian charm. 'Normal people keep normal hours,' he said, 'and are always boring.' He glanced at the trucks lined up behind Fuller. 'Is everything there, Mr Fuller? By which I mean the crashed saucer and its dead cyborgs. Those and every other single item you took into that hangar.'

'Every single item,' Fuller said. 'You're getting everything back.'

'It's good to know that above and beyond you, there are people with some common sense.'

'Go screw yourself,' Fuller said.

He had finally come to accept (and it hadn't been easy) that he was frightened of Wilson. He had never been frightened of anyone in his life – not until he met Wilson, who had always been icily polite and curiously civilised. Fuller was frightened of Wilson's steady blue gaze, of his absolute pragmatism, of the way he could look directly at you without blinking and reduce you to nothing. Wilson lacked normal feelings. He passed judgement, then acted. What he did was dictated by a logic so pure that it had to be inhuman.

Fuller accepted that. He didn't like it, but he understood it. Pragmatism was his own meat and potatoes - a man did what he had to do. That was Wilson.

That was Fuller, also. In truth, he and Wilson were opposite sides of the same coin.

You couldn't believe this shit coming down, but there it was on your plate. You either ate it or you starved to death. That was life in a nutshell. On the other hand, though Fuller patriotically ate this shit, he wasn't about to do so in front of Salvatore Fallaci. The former Mafioso was only Wilson's minion and as such could be used as an antidote to Fuller's fear and frustration. All the things that Fuller wanted to say to Wilson – but did not dare say – he could say to Fallaci.

'You hear me? I said, go screw yourself.'

'I'm not here to be insulted,' Fallaci said, 'so let's just do what we have to do. May I start?'

'What the fuck do you think?' Fuller responded, trying to obliterate his fear of Wilson by shitting on his assistant. 'We didn't come here at this hour to rock and roll. Take what you want and then leave.'

'I will do exactly that,' Fallaci said. 'Thank *you*, Mr Fuller.'

Using what appeared to be a miniature microphone strapped to his throat, Fallaci directed the hideous cyborgs, step by step, as they removed the crates containing the separate parts of the crashed flying saucer and the coffins containing the dead crew from the army trucks, then carried them up the ramp, into the dazzling holding bay of the mother ship. When this task was completed, the cyborgs also entered the mother ship, leaving only Fallaci outside, once more facing Fuller.

'You've shown sound sense,' Fallaci said to Fuller. 'Mr Wilson thanks you.'

'Don't mention it,' Fuller replied, trying to sound sardonic, though his stomach was churning with tension.

Fallaci grinned, turned away and walked up the ramp, into the mother ship. The ramp folded back in and the great saucer-shaped craft, again looking seamless, emitted a bass humming sound, gave off a magically pulsating whitish glowing, lifted gently off the ground, like a soap bubble floating on water, then ascended vertically to the heavens and eventually disappeared.

'Good God,' the high-ranking Air Force officer beside Fuller exclaimed softly, 'I don't believe my own eyes.'

'That's what those bastards are banking on,' Fuller responded. Then, defeated, but trying not to show it, he turned away and walked back across

the dark, eerily silent airstrip.

Chapter Thirty-Nine

Dwight had begun to feel that he had no real life – out there, where the real world was. He seemed to have spent the past decade indoors, pouring over reports of UFO sightings and UFO photographs, piecing this and that together, trying to make sense of what seemed senseless, hoping to find logic in his nightmares. The nightmares were, of course, based on what had happened not only to him, but also to Beth, and for that very reason he had been keeping a low profile with regard to his UFO researches. So low, indeed, that even Dr Epstein and Tony Scaduto of the APII had begun sending him letters, asking him what the hell he was doing.

Finally, in November 1966, a year after the Great Northeast Blackout, Dwight pulled himself out of that dark hole he was living in – not his home, but his bruised and frightened soul – to meet Epstein and Scaduto, who'd flown in from Washington DC, in a Chinese restaurant in Dayton, for lunch and a talk. With his hair and Vandyke beard now mostly grey, Epstein looked a lot older, but Scaduto, given the benefits of youth, hadn't changed that much and still wore his black-leather biker's gear. They made an unusual team.

'My feeling,' Epstein said as he turned his Singapore noodles expertly on his chopsticks, 'is that you've practically given up your UFO research. We're getting nothing back, Dwight.'

Dwight shrugged. 'I won't deny it. I *have* practically given up. Ever since that incident with Beth, I've been frightened for her and Nichola, so I decided to keep a low profile and not draw any attention to myself. What the hell! Why lie about it? I was so scared, I decided to drop out altogether, in the hope that those bastards, the men in black, or whoever, would forget us entirely.'

'Perfectly understandable,' Epstein said, nodding sympathetically. 'Had I been in your situation, I'd have been just as scared.'

‘You probably *are* in his situation,’ Scaduto said. ‘You just don’t know it yet. I mean, man, if you’re running an organisation like the APII, those bastards are bound to be watching you.’

‘But they’ve never bothered me,’ Epstein replied.

‘They have their own ways and reasons,’ Dwight said. ‘But living with the constant expectation of a visitation is just as bad as the visitation itself.’

‘So nothing new to recount?’

‘Only that Nichola’s turned nineteen and is planning to marry.’

‘Nineteen!’ Scaduto exclaimed. ‘I can hardly believe it. Makes me feel like an old man.’

‘We age overnight,’ Epstein said gloomily, clearly thinking of himself, then he brightened up enough to ask: ‘So you’ve been involved in the arrangements for the wedding?’

‘Right,’ Dwight said.

‘And Beth... How has she been coping?’

‘You mean the forthcoming nuptials or her CE-Four experience?’

‘Both.’

‘She’s thrilled that Nichola’s getting married – she’s very romantic that way. I think it’s been a healthy distraction for her, regarding the other thing. It’s kept her mind off it.’

‘And what about the so-called “other thing” – the CE-Four experience?’

‘Since having her hypnotic treatments her headaches and nightmares have gone, but she’s gradually remembering the details of her abduction and now lives in fear of the men in black and the possibility of being abducted again. That, in a nutshell, is why I’ve virtually stopped working for you. It’s for Beth. I’m frightened for her. I think that what they did to her was a warning – and it’s one that I’m heeding.’

Indeed, just thinking about it made Dwight feel that a wall of darkness was closing in around him, even in daylight. You were there, in that dungeon of the mind, and you might never get out. That’s what they could do to you. Though who ‘they’ were, he still didn’t know.

‘I don’t mind admitting that we’re desperate to get you back to work,’ Epstein said. ‘A recent Gallup Poll has shown that approximately nine million Americans now believe they’ve seen a UFO. Our research supports that figure. To put it mildly, we’re being overwhelmed with reports. So we need all the help we can get.’

‘*Nine million?*’ Dwight asked, finding it hard to believe what he was hearing.

‘Yes. An astonishing figure, right? The Gallup Poll was undertaken in the wake of one of the most widely publicised events in the history of the UFO controversy: the furore over the Dexter and Hillsdale, Michigan, sightings that occurred eighteen months ago. Did you read about them?’

‘Yeah.’ Dwight recalled them only vaguely. ‘I remember reading about them and seeing some news items on TV. It was at a time when I couldn’t face anything about UFOs, so I guess I gave them a miss. I used to just turn my head away.’

‘You must’ve been in a fucking *bad* way,’ Scaduto said.

‘I was.’

‘May I refresh your memory?’ Epstein asked.

‘Sure. Go ahead.’

‘On March 20 last year, eighty-seven women students and a civil defence director at Hillsdale College, Michigan, saw a glowing, football-shaped object hovering over an empty swamp a few hundred yards from the women’s dorm. It repeatedly raced at, then retreated from, the dorm, dodged an airport beacon light, and flew back and forth for hours before disappearing. The next day, in Dexter, sixty-three miles away, five people, including two police officers, reported seeing a large, glowing object rising from a swampy area on a farm, hover for a few minutes at about a thousand feet, and then leave the area.’

‘An impressive set of witnesses,’ Scaduto said.

‘Quite so. And within a few days, nearly every newspaper in the country and all national TV news programmes were carrying reports on the sightings. This placed intense pressure on the Air Force to investigate the incidents.’

‘I remember that much,’ Dwight said, growing interested despite himself. ‘The head of Project Blue Book, Major Hector Quintanilla, sent Dr J. Allen Hynek to investigate the sightings.’

‘Right – and Hynek had to virtually fight his way through the reporters to get at the witnesses. Later, he stated that the entire region was gripped by near-hysteria. He did, however, manage to complete his investigation and afterwards held what was reported as being the largest press conference in the history of the Detroit Press Club.’

‘Hynek’s widely respected,’ Dwight said, ‘so where he goes, the press

goes.'

'Knows his stuff,' Scaduto murmured.

'He's brought respectability to the subject,' Epstein said, 'and I'm grateful for that. Unfortunately, in this instance, he fell flat on his face.'

'Oh?' Dwight said. 'How?'

'He made the simple mistake of not thinking before he opened his mouth. With the news hounds all baying for an instant explanation for the sightings, he suggested – purely as a hypothesis – that they might have been caused by marsh gas.'

'What the hell's that?' Scaduto, an urban man, asked.

'It's a phenomenon caused by the spontaneous ignition of decaying vegetation and it produces eerie, glowing lights.'

'Thank you, professor.'

'Anyway, the press latched onto the words "swamp gas" and had a field day making fun of them, with the ironic result that coverage of UFOs reached unprecedented levels during March and April – particularly regarding the Dexter-Hillsdale sightings. So much so, in fact, that Weston E. Vivian, Democratic Congressman from Michigan, and Gerald Ford, House Republican minority leader, formally called for Congressional hearings.'

'Oh, Christ, yes,' Dwight said. 'I remember it all now. But that's about as far as I got. That's when I stopped reading about it. And I started switching the TV off when the subject was raised. So what happened next?'

'The House Armed Services Committee,' Epstein said, 'acted on Ford's suggestion and on April 15 – for the first time in the history of the UFO controversy – Congress held an open hearing on the subject. When the hearings were completed, the Secretary of the Air Force, Harold D. Brown, directed the Air Force chief of staff to make arrangements for a special, independent, civilian team to investigate selected UFO sightings. Subsequently, on May 9, the Air Force announced that it was planning to contract with scientists for a full-scale UFO investigation.'

'And last month,' Scaduto interjected excitedly, 'the Air Force announced that the University of Colorado had accepted the UFO study project and that Edward C. Condon would be in charge.'

'Who's Condon?' Dwight asked, more intrigued every minute, feeling that he was coming back to life after being buried alive.

'An internationally known physicist and former head of the National

Bureau of Standards,' Epstein told him.

'Impressive,' Dwight said.

'Which is exactly why they picked that bastard,' Scaduto said with surprising, unexpected bitterness.

'Here's the interesting part,' Epstein said. 'The part not included in the press reports.'

'Go on,' Dwight responded, leaning forward, as if drawn to Epstein by a magnet.

Epstein smiled slightly, knowing that he'd hooked Dwight again. 'Dr James E. McDonald,' he said, 'a senior atmospheric physicist at the University of Arizona's Department of Atmospheric Sciences and one of the nation's leading scientific authorities on UFOs, had accidentally seen the *classified* version of the previous Robertson Panel report at Wright-Patterson AFB. This led him to reveal, when speaking to members of the university's Department of Meteorology, that the CIA had ordered the Air Force to debunk UFOs. He had read this, he said, in the uncensored version of the Robertson Panel report.'

'Fucking A!' Scaduto exclaimed, looking happier.

'The news services picked up this story,' Epstein continued, 'and publicised it widely on the same day that the Air Force announced the establishment of the Condon Committee.'

'Condon was picked,' Scaduto added enthusiastically, 'because he's already shown he doesn't believe in UFOs. He's been tasked with helping the Air Force deny that they deliberately debunked UFO reports and to help them bury this subject once and for all. What say you, Dwight?'

'I say you're right,' Dwight said without thinking. 'And what we have to look into is...'

He stopped talking in mid-sentence, realising that he'd just committed himself again, despite his lingering doubts. When he saw the grins on the faces of Epstein and Scaduto, he couldn't help laughing.

'I don't believe it,' he said, when he had managed to contain himself. 'You pair of bastards came all the way from Washington DC just to seduce me into going back to work.'

'We sure did,' Epstein said.

'So are you in or out?' Scaduto asked.

'Count me in,' Dwight said.

The three of them raised their glasses in the air and tapped them together in a toast.

It was the last of their good days.

Chapter Forty

Sitting on his rocking chair on the veranda, overlooking the fenced-in compound, Ernst Stoll observed the arrival of Wilson's flying saucer with no great deal of pleasure. This time Wilson was coming in a medium-sized saucer, 150 feet wide, and carrying, so Ernst hoped, a 35-foot diameter, two-seater saucer with a cyborg pilot for his personal use. Ernst still had his own thoughts about that and they were making him nervous.

Indeed, as he watched the *Kugelblitz III* descending vertically over the steaming canopy of the rain forest, he was torn between his need to escape this filthy hole and his dread of what might happen if he tried. Over the past few months it had dawned on him that he had now been here for years - nearly twenty years, in fact – and that there had been no indication that Wilson would ever let him leave. Ernst was rotting in this jungle; perhaps even losing his mind. With little stimulation, he could not stretch himself and was, he felt, becoming like a vegetable, blending in with the forest. So depleted was he that he could not even enjoy sex with his Ache comfort girls, let alone still be thrilled with the feeling of power that he had formerly received from running the compound like a merciless god. Now he wanted only to die in the Fatherland, preferably in Mannheim, where he had been born, and rest in the same soil that had taken his wife and children so many years ago.

Naturally he was nervous about telling Wilson this, but was determined to do so. A man could only take so much and he, Ernst Stoll, had had enough. He would plead for release.

As Wilson's saucer descended slowly, majestically, into the clearing, its familiar bass humming sound grew louder and became almost palpable, an odd vibration that shook Ernst's log-and-thatch house. Looking up, he saw the immense, spherical, deceptively seamless craft blocking out the tropical sky as it dropped lower. Still quite high up, the saucer was spinning rapidly on its own axis, except for the gyroscopically stabilised central fuselage. The

rapid rotation of the circular outer wings slowed down as the saucer descended, creating violent currents of air that made loose grass, plants, soil and gravel swirl wildly, noisily, in the air, as if caught in the eye of a hurricane. As always, the native workers and captured Ache Indians were staring up in awe as the gigantic saucer descended, cocooned in a familiar whitish glow. This glow darkened to a more normal metallic grey when the saucer hovered just above ground level, bobbing gently like a cork in water, its thick hydraulic legs emerging from four points equidistant around its base, to embed themselves deeply in the muddy ground. The saucer bounced gently on the legs, but eventually settled and was still. Its rotating wings gradually slowed and then stopped altogether, as did the wildly swirling, artificial wind. Silence reigned for a moment.

As a panel in the concave base opened up to form a ramp leading down to the ground, Ernst rose from his rocking chair, stepped off the veranda, and advanced to meet Wilson. The latter emerged from the holding bay of the saucer, tall, slim, naturally elegant, white-haired, oddly handsome with the aid of plastic surgery, and with a psychic aura as cold as a block of ice. Ernst practically trembled with fear the instant he saw him.

Wilson did not offer his hand. He just nodded and said, '*Guten tag*, Ernst. It is good to see you.' Speaking German, he was inclined to become rather formal.

'And good to see you, sir.'

'You are well?'

'Yes, sir, and you?'

'I'm in excellent condition for my age, given all the medical and surgical aid I've had. You must try it yourself, Ernst.'

Ernst felt himself smiling nervously, without humour. 'I don't think I'm quite ready for that yet. Perhaps a few years from now.'

Even as Ernst was speaking, four of the hideous cyborgs, mutated from unfortunate Ache Indians, came down the ramp behind Wilson, looking even shorter than they were beside the Frankenstein who had created them. Ernst shuddered to see them.

'As promised, I have brought your present,' Wilson said, still speaking in formal German. 'But let us have lunch first.'

'Naturally. Yes, sir.'

Ernst led his lord and master back to the house where, on the veranda,

which was pleasantly cool, they had what Wilson considered to be a major meal: fruit-and-nut cereal, with a glass of cold, very dry white wine. While partaking of the lunch, he expressed his concern that the Americans and Soviets were, ironically with his help, progressing technologically much faster than he had anticipated.

'Since Lyndon B.Johnson was sworn in as President,' he explained, 'after the assassination of Kennedy, both the Americans and the Soviets have had men drifting outside their spacecraft; two separate US Gemini spacecraft have met in space and flown side-by-side only six to ten feet apart – an achievement requiring astonishing technical accuracy by their modest standards – the first space docking has been made by a US astronaut; and, finally, an unmanned US *Surveyor* spacecraft has soft-landed on the moon.'

'Well, sir, you *did* help them with that,' Stoll dared to remind him, 'even if indirectly, with your supplies of scientific drawings and a great deal of highly advanced technology.'

Wilson nodded. 'Yes. As part of that agreement I promised the Americans, through CIA agent Jack Fuller, that they would be the first to land a man on the moon. As always, I'd intended keeping that promise. However, the speed with which the Americans are advancing scientifically had made me feel that I must hinder their progress, as well as American and Soviet progress in general. It's clear from my recent conversations with Jack Fuller that they're growing arrogant, believing that they can somehow catch up with my achievements, which is why I arranged last year's Great Northeast Blackout as a warning to them. After that, they cooled down for a while, but already they're growing arrogant again, so clearly they need another lesson.'

'What have you planned?'

'I've learnt through one of my brain-implanted spies located within NASA that they have a rehearsal for another Apollo launch planned for January 27 next year. The same man – one of NASA's top scientists – will therefore ensure that the spacecraft malfunctions and bursts into flames, killing all three of the astronauts on board. A couple of months later – I believe this will be April – when cosmonaut Vladimir Komarov is due to orbit the Earth in a Soyuz spacecraft, we'll attack it with a laser-beam weapon fired by one of our saucers. We'll make the spacecraft crash, killing Komarov. The combined deaths of the cosmonaut and three astronauts will almost certainly cause consternation and result in delays in the space race between the

Americans and the Soviets. I think this will work, yes?'

'I think so,' Ernst said.

When the meal was finished, Ernst made his usual report to Wilson, telling him about the negative or positive aspects of the capturing and holding of the Ache Indians and any difficulties presented by his dealings with Paraguay's officials, most of whom were as corrupt as their master, President Stroessner. Eventually, when he'd completed his report, he glanced across the compound with its mud-and-thatch shacks, goats, chickens, mosquitoes, piles of shit and everything else he detested here, including the native workers, men and women alike, and suddenly blurted out that twenty years here was too much.

'I desperately want to return to Germany,' he said finally.

'Why do you wish to return?' Wilson asked.

'It is the Fatherland...'

'It is not,' Wilson interjected in his remote, unemotional way. 'The Fatherland died with the ending of the war. What you want is no more.'

'Still, my wife and children died there. Everything I had was there. I have been here for twenty years and I'm growing old and I yearn for the past. Please, sir, let me go.'

'I didn't realise you were so sentimental,' Wilson said with a smile that did not reach his eyes and held no warmth at all – a smile as cold as the grave.

'Nor did I,' Ernst replied, 'but I am. It's a sign that I'm growing old.'

'I'm sorry, Ernst,' Wilson said, showing no sign of emotion whatsoever, 'but I'm afraid I cannot say "Yes" to that just yet. We still need you here. You are doing invaluable work here. Rest assured that it will end in a year or two, and then we can consider this matter again. But why Germany? There's nothing left for you there. In a year or two, when your work here is finished, you can return to Antarctica for medical and surgical rejuvenation. When that's completed, we will find you something suitable to do there; or, if you prefer, somewhere else. But not Germany. There you could still be picked up as a war criminal and forced to stand trial. We cannot risk that.'

'That's the problem,' Ernst said, feeling even more desperate, knowing that he was going to lose out again to Wilson. 'It's not just a matter of getting back to Germany. The truth is that I don't think I can stand it here much longer. This place is gradually driving me crazy. I have to get out.'

'You simply need a short break now and then,' Wilson insisted in his cold-blooded, icily pragmatic way. 'You don't need to return to Germany. You

just need to get out of here more often, perhaps visit Asuncion.'

'The journey is too difficult,' Ernst said, aware that he sounded pathetic, his heart sinking with the knowledge that Wilson was going to be unbending about letting him leave here for good. 'And besides, it's too dangerous. This compound is in the middle of the rain forest, the jungle, and the only way out is by river. That makes short breaks difficult.'

'Which is precisely why I've brought you a gift, Ernst. A small, two-seater flying saucer with a programmed, totally obedient cyborg pilot. Come and look.'

Even as they stood up and walked down the steps of the veranda, a 35-foot wide flying saucer emerged slowly, gracefully, from the holding bay of its mother ship, barely inches above the floor, but certainly floating in mid-air, and advanced over the clearing, watched silently by the awed, terrified natives and Ache Indians. Made, like all of the flying saucers, from minutely porous magnesium orthosilicate and electrically charged, it was surrounded by that familiar whitish glow, caused by the ionisation of the surrounding atmosphere. With its outer rings rotating around its fixed, cupola-shaped central fuselage, it looked like a giant spinning top. Unlike the bigger flying saucers, however, it had a visible Perspex dome not much larger than the cockpit of a small airplane.

Standing beside Wilson in the clearing as the saucer advanced towards him, Ernst could see, in that cramped, two-seater pilot's cabin, the silhouetted figure of what had to be the cyborg pilot. A lump came to his throat as the saucer settled gently on the ground, its four legs extending to embed themselves in the mud. He was recalling how desperately, when an aeronautical student, first at the Institute of Technology in Munich, then in the rocket technology classes of Professor Karl Emil Becker at the University of Berlin, he had wanted to join the VfR, or Spaceship Travel Club, in the company of Werner von Braun, Rudolph Nebel, Willy Ley, and Hermann Oberth, to build rockets that would soar to the heavens. That dream had been crushed when he joined the SS and, eventually, came under the influence of the almost inhuman Wilson, who, for the past twenty years, had kept him imprisoned between helpless reverence and dread. Now, when he studied the small flying saucer, he saw the means of his escape and, formulating it, was filled with terror at the thought of what Wilson might do if he failed and was captured and brought back. Thinking about the possibilities, Ernst had to

wipe sweat from his brow and control his body's trembling.

'Beautiful!' he exclaimed softly, referring to the small flying saucer now resting in the middle of the clearing, dwarfed by the immense *Kugelblitz III*.

'Yours,' Wilson responded. 'It's not stratospheric, but its range is virtually limitless and you can use it for lengthy journeys at an altitude that will keep you well above normal airplanes, out of the range of radar, thus out of sight. Use it to give yourself some short breaks, away from this place. You'll feel better then.'

'It's been so long,' Ernst said hesitantly. 'I don't know how to fly any more. Certainly not...'

'The cyborg pilot will do the flying for you when the saucer isn't on autopilot. One of our first fully functioning cyborgs. Look!' Speaking into the pinhead microphone strapped to his throat, Wilson ordered the pilot out. With the saucer being so small, the pilot emerged rather like the pilot of a normal airplane: by opening the dome-shaped Perspex hood, which split into two parts, then clambering out and simply slithering down the sloping side to the ground. When, in this instance, the pilot had done so, Ernst looked at him in horrified amazement.

He was both horrified and amazed because he actually recognised what was left of the original Marlon Clarke, the farmer abducted in Socorro, New Mexico, in 1947 and flown to the Antarctic after witnessing the crash of a flying saucer. Clarke had been turned into a hideous man/machine hybrid, or cyborg. His head had been severed, kept in cold storage, then transplanted to the body of a small, headless Ache Indian. Ernst was surprised that he still recognised Clarke, because there was so little of his original face to be seen. His skull was covered in the stereotaxic skullcap that kept electrodes implanted in his head at all times; and his lower face – ears, nose, mouth and jaw – had been replaced with an ugly metal prosthetic. The hands of the original Ache Indian had been sliced off and replaced with what would have looked to most people like vicious metal claws, though they were, as Ernst knew, CAMS, capable of highly sophisticated movements. Clarke looked like a monster.

'Plastic artificial heart,' Wilson explained. 'Bionic audio transmitters to replace the mechanism of the inner ear. Plastic arteries. Synthetic bones in both legs and the lower arms attached to the CAMS. The latter, while looking like metal claws from afar, actually have fingertips of polyvinylidene

fluoride, which detects alternations in pressure and delivers the appropriate impulses to the nerve ends. Brain-implantations, of course, and programmed for absolute obedience – you speak, he obeys. Here... strap this pinhead microphone to your throat.'

Ernst took the tiny microphone, wrapped the strap around his throat, and clipped it shut with the microphone resting on his Adam's apple.

'Now identify yourself,' Wilson said. 'Tell the cyborg your name,'

'My name is Ernst Stoll.'

'Good,' Wilson said. 'That's all he needs to know. He now knows the sound of your voice and will react automatically to it with total obedience.'

'Amazing,' Ernst said, feeling hope even in his despair, seeing light where only darkness had reigned.

'He's a gift for your years of devotion to duty,' Wilson said. 'Use him well. Now I must be going.'

Nodding at Ernst, since he rarely shook hands these days, Wilson went back up the ramp of the bigger saucer, followed by his four cyborg guards. Once they were all inside, the ramp closed and the saucer lifted slightly off the ground. Shortly after it had lifted off, and while it was still hovering above the ground, its hydraulic legs were drawn back into the base of the central body and the panels closed so precisely that the joins around them could not be seen. Then the saucer rose vertically, slowly, to just above the canopy of the soaring trees, hovered there for a few seconds, then abruptly shot upward, shrank rapidly, and then disappeared.

The cyborg pilot, Marlon Clarke, was standing silently in front of the small flying saucer, practically brain-dead until activated by instructions from Ernst. Both terrified and exhilarated by what he was contemplating, Ernst hurried back into his log-and-thatch house, to have a strong drink of schnapps, which helped give him the courage he needed to do what he was planning.

Sitting there on the sofa in the middle of the room, he looked around at the photos that showed his own history: a golden-haired child in the courtyard of his parents' imposing neo-Gothic house in Mannheim; a handsome youth sitting with a pretty young blonde-haired lady, Ingrid, later to be his wife, at an outside table of the Kranzler Café on the Kurfurstendamm in Berlin; clambering out of an army car at Stadelheim Prison, Berlin, in his black SS uniform; posing, already cynical, in the same uniform outside Gestapo

Headquarters in the Prinz Albrechstrasse with friends Brandt and Ritter, both killed in the war; celebrating with those same two friends and some whores at the Schauspielhaus in 1937, all drunk and holding up steins of beer; wrapped in a greatcoat covered with snow as he hammered swastikas on steel poles into the hardened snow of Neu Schwabenland, Antarctica, in 1938, claiming the territory for the Third Reich; already ageing and embittered when with the flying saucer team – Wilson, Rudolph Schriever, Klaus Habermohl and Otto Miethe – outside the hangar of the research centre at Kummersdorf, located at the other side of the firing range separating it from Werner von Braun's Rocket Research Institute; twice with the Reichfuhrer, Heinrich Himmler – first looking icily controlled in the SS headquarters in Berlin, then, six years later, looking deranged in the sanatorium of Dr Gebhardt at Hohenlychen; finally, with generals Nebe and Kammler in the great underground complex of the Nordhausen Central Works in Kahla in the Harz Mountains. And, of course, the women, his *few* women... That erotic dancer, Brigitte, from the White Mouse in the Franzosischestrasse; the sensual, treacherous Jew bitch, Kryzstina Kosilewsky, from Cracow; and, coming last, but in a framed picture hung on the wall directly facing his desk, his wife, Ingrid, and their two children, Ula and Alfred, taken two weeks before they died in an Allied air-raid...

Ernst almost choked up then, overwhelmed with emotion, recalling that more human aspect of himself before the war, Wilson and this hellish jungle had eaten up the last of his soul. He was going mad here – he had to get out – and now he was going to attempt to do just that while he had the chance.

He was terrified of what would happen if he failed, but he still had to try it.

Hurriedly packing a shoulder bag with his basic necessities, the photos he had just been studying and, most important, the great deal of cash he had gathered over the years from various transactions with General Stroessner's corrupt officials, he left the house for what he hoped would be the last time. Crossing the muddy compound to the small flying saucer, he glanced with distaste at the log-and-thatch cabins, the bamboo cages packed with imprisoned Ache Indians, the native men and women kneeling around camp fires, the mangy dogs and chickens and goats, all dwarfed by the soaring trees, and was thrilled at the prospect of never seeing them again. Approaching the cyborg pilot, who stared at him with almost dead eyes from between the stereotaxic skullcap and the metal lower-face prosthetic – a truly

awful sight – he ordered him, by speaking with the aid of his throat-microphone, to climb up into the saucer. When the cyborg had done so, Ernst followed him, clambering up the gently sloping side and slipping into the pilot's domed cockpit. When both he and the cyborg were strapped into their seats, their shoulders almost touching, which made Ernst feel uneasy, he told the cyborg to take off, ascend as high as possible, then turn towards the sea and set the autopilot for West Germany.

Obeying, the cyborg activated the saucer and soon, after the cockpit covering had closed automatically, its circular wings were rotating and taking on the whitish glow of ionisation. The saucer lifted off gently, swayed just above the ground, then ascended in a stately manner until it was above the canopy of the trees. So excited he could scarcely breathe, Ernst managed to take one last look at the fenced-in compound, now practically lost in the jungle far below, then the saucer suddenly shot off at startling speed, flying smoothly above the vast, river-divided, densely forested landscape of Paraguay.

Ernst didn't get as far as the sea.

No sooner had the small saucer gone into horizontal flight than Wilson's much bigger saucer, the mother ship, appeared magically out of nowhere to sit on its tail. Horrified to see this, Ernst was also terrified when Wilson's voice came out of amplifier vents in the cyborg's steel facial prosthetic, saying in German, 'I know what you're attempting, Ernst, and I'm disappointed in you. You will now be punished for your betrayal. I'm sorry to have to do this.'

Instantly, the cyborg let out a demented, hideously human wailing that cut right through Ernst. Smoke poured out from behind the featureless lower-face metal prosthetic, followed by showering sparks. Then, as the cyborg continued its ghastly, ear-splitting wailing, the steel prosthetic blew off, revealing the surgically shredded bone and flesh around the removed mouth, jaw and nose, with blood squirting out and splashing over Ernst. Even as Ernst looked on, aghast, too shocked to think clearly, the cyborg's head started smoking beneath the skullcap and he made an odd rattling sound – the sound of Marlon Clarke dying – then slumped sideways in his seat, clearly dead.

As Ernst stared at the cyborg, mesmerised by shock, the saucer flipped over and started spinning rapidly towards the earth. Rendered dizzy and nauseous

by the spinning, almost deafened by the hammering of wind against the canopy, not knowing which way was up and which down, Ernst was further punished by the sight of the dead cyborg rocking wildly in his seat with blood still spewing from the mess of exposed bone and flesh where the metal prosthetic had been. He then saw the spinning jungle rushing up towards him and knew that the saucer was about to crash.

Ernst screamed in terror.

Miraculously, just before the spinning saucer struck the canopy of the trees, Wilson's saucer appeared above it. A pyramid of brilliant light, some kind of force field, beaming out of the base of Wilson's enormous craft, enveloped Ernst's spinning machine and appeared to place it under control again.

Held in that pyramid of light, Ernst's saucer, though now the right way up, raced on a descending trajectory towards the jungle – heading back, as Ernst realised with dread, in the general direction of his compound by the river.

The jungle rushed up towards him. The pyramid of light blinked out, then Wilson's saucer ascended abruptly, vertically, and appeared to dissolve into the blazing sun. Ernst covered his face with his arms as he crashed into the jungle.

He survived... almost certainly because of Wilson. Though the saucer crashed, it levelled out before doing so, smashing through the trees, hitting the ground the right way up, and then sliding through the soft mud until it finally came to a shuddering halt.

Though battered, bruised, badly cut and bleeding, the shocked Ernst still managed to crawl out of the saucer, which was mangled but still in one piece. Standing upright, but almost falling again from dizziness, he wiped blood from his eyes and eventually managed to orientate himself. After taking a final look backwards at the crashed saucer, which already was being covered in falling leaves, he began what he knew would be a long, hellish march back to the compound.

He had been punished and sentenced. Now he knew that he would be imprisoned in the compound for the rest of his days.

His hell was right here on Earth.

Chapter Forty-One

In October, 1967, Dwight paid a visit to Dr Epstein and Scaduto in the APII headquarters in Washington DC, where he was introduced to two new members of the organisation, both physicists: a handsome, sardonic young man named Robert Stanford – whom Epstein always addressed simply as 'Stanford' – and the relatively famous Dr Irving Jacobs. Stanford was pretty flashy, dressed like a Californian in a sky-blue open-necked shirt, denims held up with a fancy leather belt, and a windcheater jacket. Dr Jacobs, older and wiser, was wearing a standard grey suit, shirt and tie, and well polished black shoes.

'Though he looks like he comes from Malibu,' Epstein said, 'Stanford actually hails from right here, in Washington DC.'

'McLean, Virginia, to be precise,' Stanford explained with a shit-ass grin.

'Dr Jacobs, on the other hand, hails from Camelback Hill, Phoenix, Arizona, and has been kind enough to fly here just for this meeting. They've both signed up to work for the APII and I'm pleased they're with us.'

'It's swell to have you aboard,' Dwight said, shaking the hands of both men in turn.

'Still got me to deal with, though,' Scaduto said, looking even cockier than Stanford. 'Bet *that* gives you headaches!'

'Headaches from bastards like you I can enjoy,' Dwight replied. 'At least they keep me awake.'

'Ain't he just the nicest sonofabitch?' Scaduto asked rhetorically. 'Say, hey, let's get cookin'!'

Though he didn't know anything about the flashy, self-confident Stanford, Dwight had read about Dr Irving Jacobs in a wide variety of scientific journals and knew that apart from working for NASA and the American Nuclear Society, he was seriously interested in the UFO phenomenon. That he was joining the APII was therefore good news, since his reputation in so-

called ‘serious’ areas could only enhance the credibility of the organisation.

‘Okay, gentlemen,’ Epstein said, indicating the chairs around his desk with an airy wave of his right hand, ‘now that my good friends Dwight Randall and Tony Scaduto have had their regular little get-together skirmish, please take a seat and let’s talk.’ When they were all seated, lighting up cigarettes and sipping water or coffee, he said to Dr Jacobs: ‘As you still work for NASA, Irving, can I begin by saying how sorry I was to read about the deaths of those three astronauts, Grisson, Chaffee and White, in the flash fire that swept through their Apollo spacecraft last January. It must have been a real blow to you.’

‘It’s been a bad year for the space programme in general,’ Jacobs replied. ‘I mean, apart from our three unfortunate astronauts, there was the death of the Soviet cosmonaut, Vladimir Komarov, when his Soyuz spacecraft crashed after coming out of orbit. In neither case – NASA or the Soviet Union – did anyone have a clue as to exactly what happened. God knows, it was certainly a year of disasters that set the space programme back a good deal and could threaten its funding.’

‘Which won’t help the APII,’ Stanford said. ‘Because when public interest wanes in the space programme – which it always does when funding is cut and there’s no media attention fixed on it – it also wanes regarding UFOs. Alas, some people – indeed millions of goddamned people – tend to link the two together. That’s one of life’s unfortunate facts.’

‘The man’s a philosopher,’ Scaduto said.

‘You read me loud and clear,’ Stanford replied. ‘I have a big mouth.’

‘On the other hand,’ Scaduto said, ‘to get back to the subject of this meeting, it *has* been a wonderful year for UFO sightings.’

‘In what way?’ Jacobs asked.

‘Biggest goddamned UFO flap since the mid-1950s, including the great March concentration from Montana to Maryland.’

‘I was out of the country then,’ Jacobs said. ‘I *did* read a little about it, but can’t remember too much. I was in Paris, France, where the government is seriously considering the setting up of a UFO investigations programme, but their newspapers don’t write much about this country.’

‘No, the Frogs wouldn’t,’ Stanford said.

‘Literally hundreds of witnesses reported seeing UFOs,’ Scaduto said. ‘And there were more UFOs reported from as far apart as Saigon, Vietnam, and

Brixham, England. Most intriguing was a large, saucer-shaped object photographed clearly over Calgary, Alberta. However, the most widely publicised UFO-related incident was the one about a horse called Snippy, found gutted in a surgical manner, with fifteen unexplainable exhaust marks in the soil around the carcass.'

'Fascinating.' That was Epstein. 'The Snippy case has reminded the UFO community that over the past few years there's been an increasing number of similar incidents, when animals, including whole herds of cattle, were killed and robbed of their limbs and internal organs with what appears to be unusually precise, surgical skill.'

'That's one of my specialities,' Stanford said, adjusting his big-buckled belt and looking, with his flashy clothes and matinée-idol handsomeness, not remotely like the very bright physicist that he was. 'I mean, what have we got here? We've got animals being killed, sliced, and gutted where they stand with a precision that can only be surgical – not the handiwork of other, scavenging animals. I say it has to be done by extraterrestrials.'

'Why?' Dr Jacobs asked.

'They want the body parts and internal organs for research purposes,' Stanford replied without hesitation. 'Some kind of medical or surgical research. Find out how we work, right? I mean, find out how our bodies function.'

'But why so many parts?' Dwight asked.

'That's the million-dollar question,' Stanford said.

Dwight was just about to respond when Scaduto indicated with a slight shake of his head that he should say nothing more on the subject. Wondering what Scaduto was up to, Dwight went back to more mundane matters, mainly checking the facts and figures regarding recent UFO sightings in his particular area of Dayton, Ohio.

'And how's Beth?' Epstein asked him when he had finished with his summary.

'She's improving, but never too settled,' Dwight replied, plunging instantly, helplessly, into a well of fearful memories. 'She still has nightmares, but at least, for the time being, there are no visits from men in black, either real or imagined.'

'You have to be brave, Dwight.'

'No,' Dwight replied. '*Beth* has to be brave. I can only offer support.'

‘She’s a strong woman.’

‘Yes, I think so.’

‘Well,’ Epstein said, obviously uncomfortable with the subject and raising his hands inquiringly in the air, ‘anything else to discuss or do we call it a day?’

‘No more from me,’ Scaduto said.

‘You?’ Epstein asked of Dwight.

‘Not from me,’ Dwight replied.

‘Anything you two want to ask?’ Epstein said to Stanford and Jacobs.

‘Not really,’ Stanford said. ‘It’ll take me about a month to check through these APII reports, but once I’ve done it, I’ll get back to you with my assessment and recommendations.’

‘Robert and Irving,’ Epstein explained, ‘have been taken on to do a long-term projection based on the flight patterns of UFOs, assessing frequency, direction of approach and retreat, and any other facts that will give us an indication of where they come from. We now have a pretty broad knowledge of their technical abilities and extraordinary flight characteristics; what we don’t know is exactly *what* they are and where they originate. Stanford and Dr Jacobs are going to try to come up with a pattern by analysing every single report in the APII files, going all the way back to 1947. Any help that you two... ’ here he nodded at Dwight and Scaduto... ‘can give will be greatly appreciated.’

‘Just give me a call,’ Dwight said.

‘Likewise, guys,’ Scaduto added.

‘Well, that just about wraps it up,’ Epstein said. ‘Are you two lunching, as usual?’

‘Yep,’ Dwight replied. ‘And as usual, you’re going to refuse to join us.’

‘I’m afraid so.’ Epstein spread his hands in that oddly rabbinical manner. ‘I have a desk piled with work and a lot of business still to cover with Dr Jacobs and Stanford here, so if you’ll excuse us...’

‘We come all the way to Washington DC to be thrown out of his goddamned office,’ Scaduto said, grinning. ‘On the other hand, a nice lunch and a couple of drinks... Are you ready, Dwight?’

‘I’m your man,’ Dwight said.

They both stood up, shook hands with Robert Stanford and Dr. Irving Jacobs, then left the office.

Soon after, they were having their traditional lunch in Clyde's in Georgetown, which Dwight had once enjoyed, but which now always reminded him of the mysterious death of his best friend, Bob Jackson. For that reason, if no other, the lunches were not as enjoyable as they had once been, though they were always informative.

'Have you mentioned your man-made UFO theory to Epstein yet?' Dwight asked of Scaduto when the meal was finished and they were having a final beer.

'Nope.'

'Why not?'

'He's a wonderful researcher, but he believes implicitly in the extraterrestrial hypothesis and I think he'd believe that any work I did in that particular direction would be a waste of the organisation's time and money. So, you know, I don't mention it.'

'Maybe you should.'

'Hey, hold on there, friend. I get *paid* by the APII. Don't wanna lose my income, don't you know?'

'But you still believe in it, right?'

'Fucking A. That's why we're here.'

'I was under the impression, possibly mistaken, that this was just our traditional Georgetown lunch, though I *did* catch your warning glance back in Epstein's office. What was that all about?'

'Get this. One of my buddies in the NICAP recently informed me that the members of the board of governors of that organisation – our lively rival – had managed to run down one of the CIA agents who'd been transferred – how shall I put it? – *out of harm's way*, after the so-called "Woman from Maine" affair. The agent, who'd been transferred to London before being eased out of the service, was naturally feeling embittered and so was willing to talk off the record, which eventually he did, during a meeting in the Drake hotel in New York.'

'A meeting with you?'

'Shit, yes.'

'Okay. Sorry. Continue.'

'Well, according to this agent, one of his assignments in the CIA was to undergo specialised training in the Duke University's parapsychology lab, a

sensory-deprivation establishment at Princetown, and the psychology department at McGill University in Canada. The purpose of all this was to open his mind, a highly responsive one, to mental telepathy, sightless vision, and psychokinesis.'

'You want me to ask, "Why?" I can tell.'

Scaduto grinned. 'The reason – and I think you've already guessed – is that the Russians were already employing agents with such skills for espionage purposes.'

'That's only a rumour. Unsubstantiated.'

'Bullshit. It's an established fact and you know it. You know damned well that the Parapsychology Lab of the University of Leningrad has been neck-deep in this shit for years.'

Dwight grinned and raised his hands in a pleading manner. 'Lord forgive me for my mendacity. Okay, please get on with it.'

'So this guy,' Scaduto continued, 'after a year of training at both Duke and McGill's parapsychology labs, found that he could, like Ted Serios, cause photographs to appear on a film by merely *concentrating on* the camera. A year after his training, in 1959, he was working successfully with US Naval Intelligence and having successful shore-to-ship telepathic communications with an atomic submarine, the US *Nautilus*. And the same year, when the press exposed the *Nautilus* experiments, he was transferred back to Washington to work with – wait for it...'

'The female psychic from Maine.'

'Right!'

'So he managed to make contact?'

'No. At least, not straight away. During his first session, in the presence of the female psychic, he failed to make contact. At the second session, however, in that CIA office in Washington DC, when the woman wasn't present, he went into a trance and made contact with... *someone*.'

'Stop tormenting me, Tony.'

Scaduto's grin was now like that of a Cheshire cat. 'Well, like the woman from Maine, he was scribbling down automatically what it was he was hearing in his trance state. However, he never found out what he wrote, because before he snapped out of his trance, one of the CIA agents present at the session spirited the message out of the office.'

'So they didn't want him to know who he'd been in communication with.'

‘Correct. And when he finally awakened from his trance state, he found everyone at the window, all excitedly scanning the sky over Capitol Hill, where the UFO had been.’ Scaduto paused, grinned, and said, ‘You want to hear the rest?’

‘You’re a natural-born actor, Tony. Just get on with it, please.’

‘Well, you know, this guy is intrigued, right?’

‘Right.’

‘But he’s also annoyed because his notes have been taken from him. So later he has a clandestine meeting with one of his colleagues, who’d been present at the trance session, and asks him if the UFO had been real. His colleague, being drunk and careless with his Irish lip, confesses that it had been, that it was part of a top-secret government project, and that one of the crew on board had been ESP-trained.’

‘So the so-called “Woman from Maine” had picked up his thoughts by accident, like someone tuning into a foreign wavelength.’

‘Exactly.’

‘Well, I’ll be damned.’

‘But that wasn’t all,’ Scaduto continued excitedly. ‘According to my drunken colleague – who couldn’t stop talking once he’d started – the UFOs reported to have landed at Cannon AFB, Deerwood Nike Base and, apparently, Holloman AFB, were for real... but they weren’t extraterrestrial.’

‘Man-made.’

‘Right. The products of highly secret activity between the Canadian and United States governments.’

‘We’re back to the Avrocar, which was bullshit. I need another beer, Tony.’

‘To hell with the beer. Just listen. These aircraft or flying saucers – call them what you will – in no way resemble the aborted projects that were leaked to, then shown to, the media, us poor shitheads included. No, they were highly advanced flying saucers of pretty remarkable capability – and there were a total of about twelve in existence.’

‘Only twelve?’ Dwight asked sceptically, thinking of the extraordinary number of sightings over the years.

‘Yeah,’ Scaduto confirmed. ‘According to my man, his colleague had been seconded to Royal Canadian Air Force Intelligence, where he was tasked with implementing internal security on the flying saucer project. There he discovered that the project had been run jointly by the Canadian government,

the US Air Force and Navy, and a few high-ranking Army officers from the Pentagon. Those bastards had managed to maintain secrecy by locating the underground production plants in the deserted regions of southern Canada, between British Columbia and Alberta; by ensuring that the production of the numerous components of the saucers was distributed between hundreds of different, international companies, none of whom could have guessed what the individual components were for; by undertaking the more specialised research in the top-secret military installations of the White Sands Proving Ground at Alamogordo, New Mexico, and similar establishments all over Canada; and, finally, by deliberately confusing the press and public with a continuous stream of ambiguous leaks and misleading statements.'

'In other words...'

'They're real flying saucers, they're being constructed in Canada, and they're being tested and flown from top-secret American military bases.'

'Do you really think this could be true?' Dwight asked.

'It sounds crazy, I know,' Scaduto replied, 'but I'd like to find out. You want to come with me?'

'I want to go back to Beth,' Dwight said.

'Love prevails,' Scaduto said, grinning again. He led Dwight out of the bar and stood beside him on the crowded pavement of M Street. 'You'll come with me,' he said confidently. 'I *know* you will. Because you have to find out. You simply have to. You've gone through so much by now, you won't be able to ignore the one opportunity you have of learning the truth. That's the hook in your throat, my friend. Adios. I'll call you.'

He walked off along the sidewalk as Dwight stood there, almost dazed, recalling what his friend had said and accepting the truth of it. Dwight just had to find out.

Chapter Forty-Two

In the early hours of February 26, 1968, Wilson was set down in a field outside McLean, Virginia, by one of his flying saucers and driven from there in a limousine ordered up by Jack Fuller to the Hay Adams hotel, conveniently overlooking Lafayette Park and the White House. When he checked into the hotel, he did so under the name of Mr Aldridge. The real Mr Aldridge was a US citizen who had been abducted many years before, surgically terminated, and used as spare parts for the ongoing cyborg programme. Wilson therefore had all of the unfortunate Mr Aldridge's papers, with his own picture replacing the original in Aldridge's passport. The purpose of the visit was to discuss the ongoing activities of the widely publicised Condon Committee. This he did with Jack Fuller over a light lunch in the Tudor dining room of the hotel.

'My so-called Great Northeast Blackout appears to have had the desired effect,' Wilson said. 'The Condon Committee being set up, as it were, by you and your friends at Langley Field.'

'Always pleased to oblige,' Fuller replied sardonically, hiding the fear he always felt when in Wilson's presence. 'I have to admit that the blackout certainly convinced everyone that your technology is still vastly superior to ours.'

'So they're now willing to play the game my way.'

'Yes. And the Condon Committee, backed by us, is our way of showing you we mean it.'

This was not strictly true and both of them knew it. The Condon Committee merely represented another defeat for the US in its cat-and-mouse game with Wilson – they had been warned and had taken heed – but sooner or later they would try to foil him again; then, if they failed, he would punish them... and so it went on.

'I notice that Condon, soon after establishing the committee, started making

it perfectly clear that he had little patience with the UFO hypothesis. Was that your doing also?'

'Yeah. Condon also deliberately showed a partiality to obvious crank claims and cases that serious UFO investigators had already dismissed as hoaxes. Eventually he made it clear that he was intent on proving the whole idea of UFOs as nonsense. All that for you, Wilson.'

'But there's a thorn in our side,' Wilson said. 'This Dr James E. McDonald.'

Fuller sighed. McDonald was a senior atmospheric physicist at the University of Arizona's Department of Atmospheric Sciences who had been interested in the UFO phenomenon for years. He was now one of the country's leading authorities on the subject and strongly outspoken in his criticism of the Air Force and the CIA.

'I'm afraid so. McDonald isn't afraid of ridicule and he's got a hell of a lot of energy. In fact, his individual research into UFOs has already far outstripped that of all other researchers, save perhaps J. Allen Hynek and Dr Epstein.'

'How did McDonald get into it?'

'About two years ago, in March, 1966, he obtained the National Academy of Science's approval for a discreet, one-man study of UFOs. But when he heard of the Air Force plans to contract a UFO study to a university, he declined to use the support of the NAS and instead used personal finance. That way he was able to investigate scores of sightings and interview hundreds of witnesses. Thrilled by his success, he then launched a crusade to alert the scientific community to the seriousness of the problem. He also took on the Air Force, repeatedly attacking it for its lack of scientific investigation and its pronouncements designed to soothe the public. Finally, he attacked us, the CIA, for our involvement in the Robertson Panel report.'

'A real trouble-maker,' Wilson said.

'Yep. And there's worse to come.'

'I am all ears.'

'In August, 1966, the Condon Committee co-ordinator, Robert Low, chosen especially by me and my colleagues, wrote a memorandum to the University of Colorado's administrators, expressing his lack of belief in UFOs. For this reason, Low suggested, the Condon Committee's real objective should be a public relations exercise in which the trick would be – and I quote – "to

describe the project so that, to the public, it would appear to be a totally objective study, but, to the scientific community, would present the image of a group of nonbelievers trying their best to be objective, but having an almost zero expectation of finding a saucer".'

'And how did they recommend that this be accomplished?'

'To place the emphasis on the psychology and sociology of persons and groups who report seeing UFOs, rather than on the non-existent UFOs themselves.'

'In other words, place the persons and groups reporting UFOs in the firing line of humiliation and ridicule.'

'Correct. However, Dr McDonald has recently managed to get his hands on that old report – which shows clearly that the Condon Committee was formed simply to discredit the UFO phenomenon. This has led to a scientific scandal, the firing of a couple of the leading members of the committee, and, even worse, a Congressional hearing to begin this July.'

'Never mind the findings of the Congressional hearing,' Wilson said. 'No matter what conclusion they come to, just make sure that the committee recommends the final, complete closure of Project Blue Book. As for McDonald, I think I should clip his wings in the fullness of time.'

'You do that,' Fuller said.

He was trying to be flippant, but when he stared at the icy-blue, penetrating gaze of the silvery-haired Wilson, he knew that he was faced with pitiless intelligence. Wilson had cast off all normal emotions as being superfluous to his requirements; now he lived with a logic so rigorous it had made him inhuman. Fuller thought of Wilson as a mutant. Though born and bred right here in America, he was a true alien being.

'So what about Dr Epstein and our other friends at the APII? What have they been up to?'

'Epstein has brought in two new men – Robert Stanford and Irving Jacobs, both physicists, who between them have produced a thick, detailed report showing that most of the more advanced flying saucers, and certainly the bigger ones, fly on a north-south course – in other words, towards Antarctica.'

'That's too close for comfort.'

'Right. And the publication of that report has led to a whole spate of articles about holes in the Poles and hidden UFO bases – just like your own, in fact.

Luckily, most of them were of the more fanciful variety and we've used that as the basis for a continuing programme of disinformation. I mean, the more outrageous the theory, the quicker we'll use it. So the APII report, while fairly accurate, is being buried in a whole heap of ridiculous stories.'

'Nevertheless, if they picked up on that, we better watch them closely.'

'They've picked up on something even more dangerous: the possibility that the flying saucers are man-made.'

Even Wilson, who rarely registered emotion, looked a little surprised. 'Epstein?'

'No. Epstein still supports the extraterrestrial hypothesis. It's the other two: Dwight Randall and, especially, that troublesome kid, Tony Scaduto. He's obsessed with the notion. Indeed, he's taken himself up to Canada and is living there temporarily, in Malton, Ontario, to check out the Avro-Canada plant. He has a good nose, that one, and tenacity, so he might have to go.'

'You're keeping him under observation?'

'Of course.'

'Good. Keep me informed of what he and Dwight Randall are up to. Is there anything else?'

'No, that just about wraps it up.'

'Then good day, Mr Fuller.'

Fuller pushed his chair back and walked out of the restaurant, slightly cheered by the thought that Wilson would at least be picking up the tab. This was all he could hope for.

Chapter Forty-Three

Scaduto dropped in on Dwight in November, 1968, two days after Richard Nixon had been elected as the 37th President of the United States. Having spent almost a year working as a barman in Malton, Ontario, which had enabled him to make a living while he sounded out the clients about the jobs they were doing in the local Avro-Canada Aircraft company, he was keen to pass on what he had learnt to Dwight.

'I can't believe I'm back in God's country,' he began when he and Dwight had settled in the living room, in front of an open fire, with a couple of beers. 'I feel like I've been in the fucking wilderness. Nice to be back in the real world at last.'

'Hardly God's country any more,' Dwight said. 'At least, not this year. Think of it... One of our spy planes seized by North Koreans, one of our nuclear bombers crashing in Greenland, the most shameful war in our history going on in Vietnam, Martin Luther King assassinated, black riots in most major cities, Bobby Kennedy assassinated, the police indulging in an orgy of Nazi-style violence at the Chicago convention, and now we've got a President that no-one would buy a used car from. God's country no more, I fear.'

'Stop being so pessimistic,' Scaduto said cheerfully, wiping beer from his lips with the back of his hand. 'Next month, I guarantee it, we'll have three American astronauts orbiting the moon in the Apollo 8 spacecraft. They might even find a few UFOs up there. I can't wait to find out.'

'So did you see any UFOs in Ontario?'

'Not quite, but I got close. See, I got me a job as a barman in Malton, near the Avro-Canada plant, and plying the guys from the factory with drinks I picked up enough idle talk to convince me that Avro had continued to work on saucer-shaped jet aircraft long after the public unveiling of that useless piece of shit, the Avrocar. At the same time, in my spare time, I drove around a lot of southern Canada, between British Columbia and Alberta, and found a

lot of top-security research plants and aircraft factories. And those places, man, they're hidden in the forested hills and couldn't be seen from the air even if you had a giant telescope. Real dense forest up there in Alberta.'

'Well, we *did* know that before, Tony.'

'Nice to be reminded, though.'

'True enough. So what else did you find out?'

'When I was moving around the area, socialising wherever I could, I became bosom pals with a test pilot, Frank Lomax, who'd once worked for a Canadian-US company involved in the design and construction of highly advanced saucer-shaped aircraft; some piloted and as large as regular aircraft, others only two or three feet in diameter, remote-controlled, and being mass-produced. Both prototypes reportedly based on captured World War Two German designs.'

'What makes you think he was telling the truth?'

'The production plant for the saucers was located in a densely forested, mountainous region that protected it from the eyes of the commercial airline pilots. But Frank, who now runs a private flight-training school just outside Alberta, knows the tricky flight path that takes you over the test grounds for the saucers, and he agreed to fly me over them, in the hope of seeing a parked saucer. Unfortunately, he agreed to do this just after I'd booked my return flight to Washington DC, but I'm going back eventually to take him up on his offer. I want you to come with me.'

Though instantly excited by the thought, Dwight found himself saying automatically, 'I'm frightened of drawing attention to Beth or myself. Particularly as Beth's been plagued again by nightmares about the men in black. I wouldn't want anyone to know I was doing that – spying on those aircraft companies in Canada.'

'I guarantee that Frank won't mention your name to anyone and that all references to the flight booking will be in my name. I don't have a wife and kids, so I'll take my chances.'

'I don't think I can refuse this offer, Tony, but I'll have to ask Beth. She's in a pretty bad way at the moment and has begged me to stay out of the UFO controversy.'

'But you'll ask her?'

'Yeah.'

'When?'

‘I can tell you’re keen. I might as well get it over and done with, so I’ll ask her this evening over dinner. Did you want to stay, by the way?’

‘Nope. Not if you’re gonna have your little talk with Beth. Don’t think I wanna see or hear that.’

‘You’re pretty damned cynical about marriage, aren’t you?’

‘That’s ‘cause I’m not married.’ Scaduto handed Dwight an address card. ‘Here’s the hotel I’m staying at in Dayton. Give me a call when you know either way.’

‘I’ll do that,’ Dwight promised.

Scaduto stood up, finished off his beer, then went into the kitchen-diner to call out a slightly nervous goodbye to Beth. Though she had nothing personal against him – and, indeed, had once found him amusing – she now disliked seeing him here, because she knew he was bringing news about UFOs and, almost certainly, trying to persuade Dwight to return to UFO work, which she no longer wanted him to do.

In the event, Dwight didn’t have to wait until dinnertime to broach the subject, as Beth, the instant Scaduto had departed, came out of the kitchen, drying her hands on a towel and looking grim. She was still an attractive woman, but she looked worn down by nervous tension. ‘So what did he want?’

Not knowing how to state it gently, Dwight went for the blunt approach, though he tried to make it sound more casual than it was. ‘He just wants me to make a trip with him to Alberta, Canada, then fly over some forested area where we think there may be man-made flying saucer construction plants.’

The casual sound didn’t work. Beth’s face turned pale with barely suppressed fury. ‘You promised, Dwight. You said...’

Dwight cut her short by holding up his hand. ‘I won’t go if I don’t have your permission, but Tony *did* insist that my name won’t be mentioned with regard to the flight and the aircraft will be rented in his name. Besides which, I can’t see how we would attract much attention by simply flying a chartered plane over the mountains. Lots of tourists do it.’

‘You’re looking for UFO bases!’ Beth snapped vehemently.

‘From an airplane, Beth. Not on the ground.’

‘I don’t give a damn. If they see the plane, they’re liable to come up and blow you out of the sky. Who knows? And I don’t want to be left alone here. You *know* that. *I’m scared!*’

‘You can surely spend a mere couple of days with Nichola. She...’

‘Never mind Nichola! I don’t want you to go. I’ll be worried for you and for myself and even for Nichola. Honestly, Dwight,’ she continued, then made an accusation that she had often made during the early years of their marriage. ‘I sometimes think you’re more concerned with UFOs than you are with me. Well, damn it, go if you want to, but don’t expect me to sanction it.’

With that she turned away and stomped back into the kitchen. Dwight followed her in and placed his arms around her. ‘It’s okay,’ he said, hoping to hide his acute disappointment. ‘I won’t go. I guess I just didn’t think.’

When she turned into his arms, smiling, he was reminded of how lovely she had been when they first married and how, despite the still barely perceptible lines of middle age, she had retained that beauty. Touched, he kissed her lightly on the lips and patted her rump.

‘Still pleasantly firm,’ he said.

She had started to cry and now wiped tears from her eyes. ‘You’d have found that out sooner if you’d touched it more often,’ she said. ‘A woman gets to miss certain things.’

‘Well, I guess I’m not as young as I used to be.’

‘Young enough. If you can’t manage everything, a little touch here and there can work wonders.'

‘I’ll bear that in mind.’

‘At least you still know how to kiss.’

‘It’s like learning to swim: once learnt, it’s never forgotten.’

‘Then plant another one on me, then get out of here and let me get on with the dinner. Nichola’s coming to join us.’

‘Terrific,’ Dwight said.

After kissing her again, then patting her rump once more, he returned to the living room. He realised instantly, however, that he was extremely depressed at losing the possibility of actually seeing a man-made flying saucer on the ground. More than that: he felt crushed. Though he hadn’t been drinking seriously since the days when he was separated from Beth and on an alcoholic binge, he now poured himself a tall, consoling bourbon, hoping to drink it before Beth came back into the living room. Unfortunately, at that moment, Nichola, now twenty-one years old, married, and four months pregnant, opened the front door and walked in, coming for dinner.

She saw the glass of bourbon in Dwight’s hand before he could set it down.

Still blonde and as pretty as a picture, she frowned disapprovingly.

'What's that, Dad?'

'Only an aperitif.'

'You only have the odd beer these days, Dad, and even then only with meals or when with friends.' She took her coat off and threw it carelessly over the back of the sofa. 'So what's the occasion?'

'No occasion. I just felt like it. Your husband has one of these every evening before dinner, so why do I need a special occasion?'

Nichola's husband, Larry Fisher, was eight years her senior and working as a civilian engineer with the military aviation development branch of Wright-Patterson Air Force Base. A decent, good-humoured man, he had a fondness for cigars and his glass of bourbon every evening before dinner. Apart from that, he had no drinking problem, so Nichola didn't mind. She clearly did, however, feel troubled to see her father drinking bourbon again – and, worse, before dinner. 'Larry's never had a drinking problem in his life,' Dwight's stern daughter said, 'but you did.'

'Only once, sweetheart.'

'Once was enough to make you a wreck and force Mom to leave you for a few years. Here, give me that.' She took the bourbon from Dwight, then sat on the sofa, where she crossed her shapely legs, deliberately had a sip of the bourbon, and said, 'So what's happened to make you reach for a drink?'

'I just wanted to give you an excuse for having one,' Dwight replied, unable to resist the gentle sarcasm.

Nichola smiled. 'I have one every evening with Larry. It slips down real easy.'

'My boozing daughter.'

'So why did I have to stop you from boozing like your loving daughter?'

'He wants to go chasing after UFOs,' Beth told her, entering the room from the kitchen at that moment, 'and I won't let him.'

'How do you mean, chasing UFOs? Dad's been doing that for years.'

When Dwight told her, preferring to do it himself, Nichola said, 'You mean there's a real chance you could solve this mystery once and for all? I mean, resolve this business that's been tormenting you for years?'

'Yes,' Dwight said. 'If we can find those saucers on the ground, the game's up.'

'And you can stop feeling that you're being driven crazy by things you

don’t understand?’

‘Yeah, Nichola, right.’

Nichola turned to her mother. ‘Then I think you should let him do it, Mom.’

‘*What*?’ Beth was shocked.

‘I think you should let him do it,’ Nichola insisted. ‘If a simple flight over the mountains of Alberta is going to end years of confusion and fear, then obviously you should let Dad take it and pray that he returns with what he needs to let him feel at peace with himself. Otherwise, if you tell him he can’t go...’ She held up the glass of bourbon and tapped it deliberately with her fingertips... ‘He’ll be back on this. So let the man go.’

‘You don’t understand, Nichola. It could be dangerous. It could draw attention to him, and then all that dreadful... *business* will start again. I don’t think I could bear that.’

‘You’ll be able to bear it if you know that the pain could end pretty soon... End for all time.’

‘It’s dangerous.’

‘But worth the risk. He goes to Canada with Scaduto, he charters an airplane, and a couple of days later, if things turn out okay – and that’s the chance we’ve got to take – he’s back here and we’re all home and dry, with the whole damn business exposed for good. No more mysteries. No hauntings. No visits from men in black. For God’s sake, Mom, he’s been trying to solve this mystery since 1947, so you can’t possibly make him stop now. He’d certainly go back on the bottle and might even go crazy. So let him take this chance, Mom. Let him leap this final hurdle. Besides, the odds on something happening to him – like being blown out of the sky by a flying saucer – are pretty damned slim.’

‘At the very least, he could end up in prison,’ Beth said, now clutching at straws.

‘You’re imprisoning him with your fear,’ Nichola told her, ‘and that isn’t right.’

Taken aback by her daughter’s maturity and bluntness, but also proud of her, Beth said, 'All right, okay, you win. I just can’t bear the thought of being...’

‘Alone here.’ Nichola finished the sentence for her. ‘But you don’t have to be. You can come and stay with Larry and me in Springfield until Dad returns. You can even have a bourbon every evening, which is more than

he'll get. So are we agreed, folks?'

'Yes,' Beth said.

'Thanks,' Dwight said.

Deeply moved and certainly proud, like Beth, of his daughter, he kissed both of his women on the cheek, then he picked up the phone and spoke to Scaduto in his hotel in Dayton.

'When do we leave?' he asked.

Chapter Forty-Four

On the commercial airline flight to Calgary, Alberta, Scaduto drank a hell of a lot and became pretty drunk. When Dwight commented on this, Scaduto said, 'You know this is gonna sound crazy – particularly with what you and Beth have been through – but now I've begun to feel – definitely, absolutely – that I'm being watched, though I can't put my finger on exactly how. No men in black or black limousines, yet I'm being observed some way, I'm sure. I don't know if it's real or just goddamned paranoia, but that's what I feel. And so I find myself drinking, trying to deaden it, trying to say, "Go away!".'

Glancing through the window of the airplane, Dwight saw a sea of deeply shadowed white clouds and, below, great swathes of forested hills. It looked desolate down there.

'I've got to confess,' he said, 'that while out of deference to Beth's fear that I'd bring attention to myself I was reducing my UFO activities, I was intrigued by the revelation that the US-Canadian saucers had been based on World War Two designs. Ever since you told me that I've been spending most of my time holed up in libraries – even wrote to England's Imperial War Museum and corresponded with German and American UFOlogists about the subject. So naturally I was pretty astonished to learn that it was true.'

'You proved it?'

'Yeah.'

Scaduto sipped more bourbon, looking excited. 'So what did you find?'

Though he now knew most of it off by heart, Dwight automatically glanced at his notes to ensure that he made no mistakes.

'According to official reports, Allied aircraft during World War Two were harassed by UFOs – mostly in the shape of balls of fire – from as far back as 1944. Shortly after the war, in the summer of 1946, the more familiar types of UFOs, most cigar-shaped, swarmed across Scandinavia, seemingly coming

from the general direction of the Soviet Union. The conclusion at the Pentagon was that German scientists, seized by the Russians at Peenemunde, where the V-2 rocket had been developed, were constructing advanced weapons for the Soviets and that the unidentified, so-called *missiles* were being launched from the rocket test site of Peenemunde, which was then in the Russian-occupied zone of Germany. This suspicion became stronger when the British, who'd also seized and taken back to Britain a wealth of Germany's top-secret scientific and weapons-research material, announced that the Germans had been working since 1941 on extraordinary aeronautical projects and on processes to release atomic energy. Included in the former was a – this is a straight quote from the documents – "remotely controlled, pilotless aircraft and a device that could be controlled at a considerable distance by another aircraft" – unquote.'

'Which would account for the balls of fire,' Scaduto said.

'Right. Anyway, faced with this, and thinking of the Soviet so-called *missiles*, possibly more balls of fire, that had been seen over Scandinavia, there was a sudden British-Canadian-US alliance to beat the Soviets in the race to follow through the German designs and complete their extraordinary aeronautical projects.'

'Which gets us to the man-made flying saucers,' Scaduto interjected with growing excitement.

'Yes. It's true that what they were attempting to build in the underground plants in Canada right after the war – with British and US back-up – was a machine with the remarkable capabilities of the ones suggested in the incomplete German material. They wouldn't achieve that goal for another twenty years, but the first, fairly crude versions of their saucers were successfully tested over the Canadian border on June 21, 1947: a total of five disc-shaped aircraft, two of them piloted and approximately fifty feet in diameter, the remaining three remote-controlled by the pilots flying nearby, these three a mere three to six feet in diameter. Those particular flying saucers could reach an altitude of approximately seven thousand feet, could hover uncertainly in the air, and had a horizontal flight speed of about six hundred miles an hour.'

'That test flight,' Scaduto said, 'could account for the Harold Dahl sighting of the same day.'

'Right,' Dwight said. 'But it was what happened *after* that test flight that

really got the ball rolling. On June 24, three days after the first successful test flights of the five Canadian-US saucers, a total of nine highly sophisticated, *unknown* saucers flew down over the Canadian underground plants, hovered there for about twenty minutes, shot off toward the Cascades, where reportedly they circled the test area; returned, circled the plant for another twenty minutes, then shot off at incredible speed. From that day on – the day, incidentally, of the famous Kenneth Arnold sighting – those flying saucers, and others, returned again and again... and eventually spread out across the whole world.'

'Holy shit!' Scaduto whispered melodramatically, as if frightened of being overheard, then he finished his drink as the airplane came in to land at Calgary. 'So where the hell do the *others* come from?'

'That's the million-dollar question,' Dwight said, 'and it keeps me awake at night.'

A few minutes later, the airplane landed. Once they had disembarked and passed through Customs and baggage inspection, Scaduto's friend, the pilot Hank Lomax, met them in the arrival's lounge. Lomax was a short, feisty character with fiery red hair and a good-humoured face mottled by a combination of sunshine and booze. He was wearing a logger's red-and-black checkered shirt, oil-smeared blue denims, and buckled black-leather boots. After being introduced to Dwight, he led both of them from the airport terminal to his old Ford car parked outside.

'We're going straight to my flight-training school on the outskirts of town,' he explained when they were being driven by him out of the airport. 'From there we'll fly out in my Piper *Tri-Pacer* to the region you want. You being an old buddy, Tony, you don't even have to charter it. You just pay for the gas used and we're quits. I'm doing this for my own amusement. Which means, of course, that you don't have to charter the airplane and there'll be no record of either of you having passed through my flight-school. Now do you love me or not?'

'I love you,' Scaduto said. 'Never mind that you're an ugly bastard - I just love the hell out of you.'

'Don't make me blush,' Lomax said.

As they were driven up ever deeper into the spectacular, forest-covered hills, Scaduto glanced around him and said, 'Just look at those goddamned hills and peaks. Easy to hide *lots* of things up here! Hell, man, you could hide

a whole fucking town.'

'Just wait till we get in my Piper,' Lomax told him. 'Then you'll really see something. We'll be heading for British Columbia and that's one wild place.'

During the drive he told them about some of the people he had worked with at the Avro-Canada plant in Malton, Ontario. 'A surprising number were Germans,' he said. 'I remember that much. And one of them in particular, Otto Miethe, claimed to have worked on a programme called "Projekt Saucer" in Nazi Germany. Jesus, man, I could hardly believe it: there we were, working for the sons of bitches we'd fought in France and Germany. Anyway, that's exactly what we were working on: saucer-shaped jet aircraft with circular, rotating wings and the pilot's cabin fixed in the middle, based on those old Nazi designs. They weren't as advanced as some of the flying saucers you read about, but they were definitely based on the German designs and more advanced than the original German prototypes. The smallest ones, about three feet wide, were really remote-controlled probing devices that could also be used to block radar and cause other malfunctions in any aircraft they flew near. You could control 'em from the ground or from another aircraft in flight; and they certainly resembled balls of fire when in the air. The larger ones came in different sizes and were all piloted. When I left, the largest was about seventy-five feet in diameter, but I know they had plans for an even larger one.'

'Who ran this company?'

'It was part of the A. V. Roe company, later called Avro-Canada, but it was backed by the British, Canadian and US governments, and guarded like a military camp. You had to sign a top-secret clause to work there, with imprisonment as just one of the many punishments listed if you broke the secrecy, even after leaving the company. I'm taking one hell of a chance with you guys, I can tell you, but what the hell!'

'And other companies like it were, or are, scattered all over British Columbia and Alberta.'

'Right. See, what they'd do to really keep their projects secret and help them with disinformation, was, they'd use a company like A. V. Roe – the main plant in Malton, Ontario – as a front. When something leaked out about what they were doing, or when there was a public outcry, they'd call a press conference and show the reporters and politicians a piece of shit like the Avrocar. Meanwhile, they'd have another plant, run by A. V. Roe or some

other big company, but listed as a legitimate experimental aircraft company. That one would do the real flying saucer construction work in a location hidden well away from view – like the one I'm going to show you today. Every couple of years, they'd formally close the factory down, listing it as bankrupt, when in actual fact they were simply moving the programme to a new, hidden location. That way, though they couldn't hide the plants *completely* from prying eyes, they were all over the place, opening and closing down again, and that made them almost impossible to trace. For instance, this plant I'm taking you to, you can bet your balls it'll be gone if you come back in a year's time. That's how they operate.'

'Neat,' Dwight said, forced to admire the diabolical cleverness of the faceless men who had made his life a torment.

A few minutes later they reached Lomax's flight-training school located just north of Calgary. There, they squeezed into his four-seater Piper *Tri-Pacer* and then took off immediately, heading across Alberta, flying above the spectacular plateau that fell down from the Rocky Mountains to eventually form the southern part of the boundary with British Columbia. Though not personally flying the airplane, Dwight almost had a lump in his throat, being reminded of his early days, when he had been a bombardier and radar operator, flying to India, China, and the Pacific with the original B-29 wing; then as a navigator with an Air Force Reserve Troop Carrier Wing. Those days were long gone now.

'Hey, what did you think of the results of last July's Congressional hearings on the Condon Committee?' Lomax asked Dwight, having to shout against the noise of the wind and the airplane's engine. 'I read that they'd resulted in a resolve to form a proper, official UFO enquiry.'

Lomax was referring to the end result of the notorious Low Memorandum, which brought heavy criticism down on the head of Edward C. Condon and his committee, most of it insisting that the committee's work had been inept or, more likely, a snow job for the Air Force or the CIA, designed specifically to kill off the UFO controversy. So loud was the furore that Congressman J. Edward Roush delivered a speech on the House floor, saying that the Low Memorandum and a subsequent *Look* article by journalist John Fuller had 'raised grave doubts as to the scientific profundity and objectivity of the project.' Roush therefore called for a new Congressional investigation under the auspices of the House Science and Astronautics Committee. Scheduled

for July 29, it was set up more ambitiously as a symposium and included an impressive array of participants, including J. Allen Hynek, astronomer Carl Sagan, the engineer James A. Harder, an astronautics engineer, Robert M. Barker, and even the widely respected, trouble-shooting atmospheric physicist, Dr James E. McDonald. Concerning the reality or non-reality of UFOs, some of those men were sceptics, but the deliberations of the hearing-symposium resulted in a general, implied criticism of the Condon Committee and a strong recommendation for the continued study of UFOs. Ironically, the hearings came to an end during a peak period of sightings that resurrected nation-wide public and press interest in the subject.

'Well, the hearing-symposium might have made that recommendation,' Dwight said, also shouting against the noise, 'but personally I'm sceptical that it'll happen. The Condon Report has just been delivered to the National Academy of Sciences for review and it's my belief that no matter what its conclusions are, the recommendations of the Congressional hearing-symposium will be overridden and we'll be back where we started – with no official support for UFO investigations.'

'You're just a cynic,' Scaduto said.

'You're like that about marriage,' Dwight replied, 'so I can feel free to swing that way about official UFO studies.'

'So it goes!' Scaduto said.

Glancing down, Dwight saw just how dense and seemingly impenetrable the forested hills and mountain ranges were. Noticing the direction of his gaze, Lomax said, 'You're wondering how they could even transport an aircraft plant into these regions, right?'

'Right.'

'Well, it may look impenetrable from here, but inventive men can do anything, and down there, spread right across the region from Alberta to British Columbia, there are not only hidden aircraft factories, but also coal mines, the odd oil field, plants for the utilisation of natural gas, and even cleared areas for the cultivation of wheat, oats and barley. So though they're all hidden from each other, as well as from us, that place is a hive of activity. And we've just started to fly over the region you've come here to find.'

Glancing down again, Dwight saw that they were now flying over snow-covered mountain peaks edged sharply against the azure sky, casting their shadows along the slopes of the dense, tree-covered plateau. Lomax flew

them east and west, north and south, in a criss-crossing pattern, sometimes at high altitude, thus giving them excellent, panoramic visual coverage; other times at an altitude so low, Dwight thought they were going to crash, though they always made it up again, missing the canopy of the trees by what seemed like a hair's breadth, flying through the starkly-shadowed gorges where the wind howled dementedly.

They flew for a couple of hours, until early afternoon, yet saw nothing except the forests and mountain peaks. Eventually, when the three of them were in agreement that they had done enough for one day, they decided to turn back.

The Piper was already at high altitude, heading back across Alberta, when Dwight saw something glinting in the falling sun. At first he thought it was nothing special – sunlight flashing off the ice – but then, as the airplane advanced and he saw more of that glinting object, he realised that it was solid and… metallic.

'Down there!' he bawled.

Glancing down, Scaduto and Lomax both agreed that the object was indeed solid and metallic. Lomax immediately took the airplane down to a low altitude that enabled him to fly along a steep-sided gorge that wound dangerously through the mountain range until it came to an open area where the forest had been cleared to make way for a compact collection of stone-block workshops, pine-board administration huts and living accommodations, and what were certainly aircraft hangars.

It was an aeronautical construction plant surrounded by high barbed-wire fences and soaring cliffs... and there, on the ground, some barely perceptible in the shadowy interior of the aircraft hangars, a few exposed on landing pads on the frost-covered ground, were half-a-dozen solid, metallic, flying saucers.

They were all about 120 feet in diameter and had their pilot cabins located at the centre of gravity. None had any markings of any kind.

Dwight and Scaduto whooped and hollered with exultation as Lomax flew the Piper directly over the flying saucers and then ascended again until the aeronautical establishment had disappeared from view.

While Scaduto was frantically marking the location on his map, Lomax turned the airplane around to make another run over the flying-saucer construction plant.

'I don't think you should,' Dwight warned him. 'They might stop us the

next time.'

'We've got to get some photos,' Scaduto reminded him while removing a 35mm camera with a telephoto lens from his satchel. 'We can't miss this one, Dwight.'

'Damned right!' Dwight said, now just as excited as his friend. 'It's too late to stop now.'

'You're sure you want me to go back?' Lomax asked.

'Yep,' Scaduto said, withdrawing the camera from its case and screwing on its high-power, telephoto lens. 'And fly as low as you possibly can.'

'You want it, you've got it.'

Lomax turned the airplane in a wide arc until it was facing the gorge again, then he descended until he was flying below the soaring cliffs, which whipped past in a blur as he flew on, following the gorge's dangerously winding course until the flying-saucer construction plant came into view again. This time, as the airplane streaked above the saucers parked outside the hangars, he banked sharply to enable Scaduto to aim the camera down and snap as many pictures as the brief time allowed. Scaduto managed to click the lens-trigger five or six times before, within seconds, the Piper was nosing back up, making its swift ascent out of the gorge.

Looking backwards and downwards for his final glimpse of the construction plant, Dwight saw one of the parked saucers swaying from side to side, then lifting a few feet off the ground. Even as the snow-covered mountain peaks falling away from the ascending airplane cut off the view, he saw the saucer shooting up vertically at tremendous speed. Before he could say a word to the others, the saucer had vanished above the clouds.

'I just saw one take off!' he bawled, to make himself heard above the wind's demented howling and the roaring of the airplane's engine. 'It went straight up there!'

Suddenly, with a speed that defied credibility, the clouds directly above were blown apart and a dark pinprick descended in the blinking of an eye to become an immense, circular, swirling, light-flecked blackness that roared directly above them.

'Oh, shit!' Lomax exclaimed, instinctively covering his head with one crooked arm, assuming that the... *thing* up there was going to crash down upon the Piper.

'It's going to hit us!' Scaduto bawled, as if reading Lomax's mind.

But it didn’t. Instead, with magical precision, it stopped abruptly, mere inches above the Piper’s cockpit, and hovered there, now so enormous that it looked like an inverted whirlpool or cosmic funnel, swirling rapidly and giving off a bass humming sound.

Even though the airplane was still flying horizontally, that great mass remained directly above it.

A swirling, circular, light-flecked blackness with a glowing edge.

As the airplane continued on its horizontal course, beneath that immense, swirling, humming dark mass, Scaduto, regaining his scattered senses, raised his camera to take a photo of the UFO’s underside. Instantly, a pyramid of brilliant light shot out of the centre of the swirling blackness, temporarily blinding the three men in the cockpit. Though his eyes were closed, Scaduto was still holding his camera upwards, clicking off as many shots as he could... until the airplane started shuddering and then rocking wildly.

‘Jesus Christ!’ Lomax bawled. ‘We’re going out of control!’

Then the Piper’s engine cut out.

Miraculously, the airplane did not plummet downwards; instead, with no sound whatsoever from its engine, with only the UFO’s bass humming sound to be heard, it continued to fly on an even course, though shuddering and rocking wildly, as if held up by the pyramid of light. It flew on like this for a few seconds, but then, as abruptly as the pyramid of light had exploded over the airplane, it blinked out and, simultaneously, with a speed that defied all sense, that swirling hole of light-flecked blackness shrank to a mere dot and then disappeared into the clouds above.

Instantly, the airplane, with its engine still silent, plunged toward Earth.

‘We’re going down!’ Lomax bawled a second time.

Yet at that very moment, the engine suddenly roared back into life, as powerful as it had been before, thus lifting the airplane too quickly and throwing it into a violent, dangerous spin. As Lomax fought to regain control, the spinning airplane plunged toward the forested hills of Alberta; but eventually Lomax managed to pull it back up, control the spin, and then level it out completely, to fly on as normal.

‘That light, whatever it was, cut the engine out,’ Lomax said. ‘The light, or something above it, held us up in the air while the engine was out.’

‘Incredible precision,’ Dwight said, recalling what he had witnessed and amazed by it. ‘That saucer came down on us so fast, you could hardly see it

descending; then it stopped mere inches above the cockpit and moved sideways as we were moving forward, remaining in exactly the same position above us. When it left, I hardly saw it going, it ascended so fast. I've never seen anything like it. It was damned miraculous.'

'But why did the crew of the saucer let us go,' Scaduto asked, 'instead of wiping us out in a crash, as they could easily have done and, indeed, almost did?'

'Because they're assuming that if we report the sighting,' Dwight replied, 'we won't be believed and might even become laughing stocks. If they'd made us crash, on the other hand, that crash would have been investigated and that, in turn, could have led the authorities to that secret flying-saucer construction plant. That's what they were hoping to avoid when they let us go.'

'Hoping?' Lomax asked.

'Yes,' Scaduto said. 'Presumably it never entered their heads that at last we have proof of their existence.' He held the camera up and grinned. 'We photographed the saucers.'

'Hallelujah!' Dwight said.

They were flown back to Calgary with all possible speed, stunned and thrilled by the experience they'd just had, exhilarated at finally having the evidence they had been seeking for years.

When they had returned to Dayton, Ohio, a few days later, they learned, as Dwight had guessed, that the Condon Report, which had just been released, had savaged the UFOlogists, mocked those who had criticised the committee's project before the report was in, vilified the other UFO research programmes, and recommended the closing down of Project Blue Book.

They also learned, when Scaduto processed the photos he had taken of the swirling, light-flecked, black base of the 120-foot flying saucer, that the film had been lightly scorched and the negatives destroyed while still in the camera.

'It was the light,' Dwight said bitterly.

Chapter Forty-Five

In March, 1969, Fuller attended a meeting at Air Force Headquarters in Washington DC with representatives of the Air Defence Command, the Air Force Systems Command, the Office of Aerospace Research, the Office of Scientific Research, and the Office of Information. Not required to be present for the first half of the meeting, which was closed even to him, he arrived just as most of the gold-braids were into their second or third whisky, bourbon or brandy and puffing clouds of smoke from fat Havana cigars, all paid for by the unwitting taxpayer. Looking at the faces of those seated around the long table, some reasonably decent, most the sagging, untrustworthy masks of those who have told a lot of lies and learned to live with them, Fuller was not overly impressed and decided that his own brand of patriotic vice was at least emotionally less stultifying.

'Welcome, Mr Fuller,' an Air Force Systems Command general said when Fuller finally entered the room. 'The meeting's over, so what was it you wanted to ask?'

'I have to report to Wilson, sir, about your recommendations regarding the Condon Report.'

'Christ, I wish we could get ahead of that bastard and blow him away,' the representative of the Air Defence Command said vehemently.

'We might eventually get to do that, sir,' Fuller said, 'but we still have a long way to go.'

'Unfortunately, that's true.'

'So what are your recommendations, sir? I have to pass them on to Wilson.'

'We've chosen to ignore the widespread criticism of the Condon Report and instead implement its recommendations.'

'I welcome that decision, sir. I'm sure Wilson will be pleased. But I have to remind you that since those recommendations have already been widely criticised, we have to be particularly careful about how we handle this

matter.'

'The report was viewed thus by the civilian UFO groups and UFOlogists, neither of whom concern us here.'

'The report was also widely attacked by the media.'

'The media is filled with communists, Fuller, so we can safely ignore it. Frankly, we're more concerned with not offending Wilson than we are with inciting squeals of rage from reds under the beds.'

'What about Project Blue Book?'

'It's been officially closed down at this meeting. Project Blue Book is dead and buried.'

'I have to say, sir,' said the representative of the Office of Scientific Research, 'that I strongly disagree with closing Project Blue Book down completely. I agree that interest in UFOlogy must be dampened, but Project Blue Book now has historical roots and should be preserved in some form, no matter how modest, to give the illusion that we did, at least originally, sincerely believe in it.'

'I agree,' Fuller said, 'and even presented the notion to Wilson. He replied by saying that all roots, even historical ones, die quickly and crumble to dust when torn from the ground – so he insisted that we kill Project Blue Book entirely.'

'Do we have to do *everything* that bastard says?' asked the representative from the Office of Information.

'For the time being, yes,' Fuller said. 'I should perhaps remind you that Wilson has kept his promise by ensuring that the US is in the lead in the space race and that an American, Neil Armstrong, will certainly be walking on the Moon this coming July – the first man in history to do so.'

'I second that motion,' said the gold-braided representative of the Office of Aerospace Research. 'Even though we pay dearly, we *have* been given some invaluable aid from Wilson, so we must keep him happy until we're perfectly sure we can move successfully against him.'

'Exactly,' Fuller said. 'And it's also my belief that the Project Blue Book records should be made as inaccessible as possible, to make life difficult for future researchers. Any suggestions?'

'Yes,' said the representative of the Office of Information. 'I recommend Maxwell AFB in Montgomery, Alabama. It's not a place too many people want to visit unless they really have to. Also, those southern officers are

notoriously prickly to deal with and even hardened researchers give up more often than not when trying to get something out of them.'

'That's fine by me,' Fuller said. 'Anything else to pass on to Wilson?'

'No,' the chorus came back from that cloud of cigar smoke.

'Fine,' Fuller said. 'Thank you, gentlemen.'

Leaving the meeting, he drove to a dark field in a pastoral, desolate area of Virginia. He sat patiently in his car until a flying saucer, infinitely more advanced than the US-Canadian saucers he was protecting, landed nearby in the same field. It descended silently, with no lights flashing, and was only revealed by the moonlight shining off its silvery, cathedral-like dome. When the front ramp fell down, the interior light beaming out was unusually weak and would have shown little to drivers passing by on the distant road.

Wilson emerged from that light, flanked as usual by armed cyborgs. He wore his customary faint smile of disdain when he walked up to Fuller.

His greeting was: 'So what did they say?'

Fuller told him what had taken place at the meeting in Air Force Headquarters. Wilson was pleased, but wanted to know what President Nixon thought about the UFO situation in general and him in particular.

'Nixon's the supreme pragmatist,' Fuller said. 'and accepts the status quo. He doesn't like it, but he accepts the necessity of dealing with you. No need for anxieties there, Wilson.'

'There's no-one more pragmatic than me,' Wilson replied, 'and I *never* suffer anxieties.'

Ignoring the remark, Fuller removed a piece of notepaper from his billfold. He checked the details written on it, then returned it to the billfold and put the billfold back into his pocket.

'I thought I should tell you,' he said to Wilson, 'that Tony Scaduto, the UFO researcher I mentioned to you before...'

'He works for the NICAP,' Wilson interjected impatiently, 'but also does a lot on the side for Dr Epstein's APII.'

'Yes,' Fuller said, 'that's the one.'

'What about him?'

'He recently flew to Calgary, Canada, with that former ATIC officer and present APII investigator, Dwight Randall. As I'd already had them placed under CIA observation, I can confirm that they were met at Calgary airport by a private flight-trainer, Hank Lomax, and taken by him to his flight-

training school, located north of Calgary. From there, the three of them flew in Lomax's personal Piper *Tri-Pacer* to Alberta and then, more dangerously, over a US-Canadian flying saucer production plant in British Columbia. There, after clearly viewing the saucers resting outside the hangars – the advanced, 120-foot saucers recently delivered by you – the airplane was pursued and harassed until it left the area.'

'Do you think they took photos before they left the area?'

'We assume so. But a laser-beam weapon activated from our pursuing saucer would have put paid to their film.'

'Very good.'

'Do you think we should do something about those men?' Fuller asked.

'Just scare them for now,' Wilson replied. 'I don't want to be involved. But if your fright tactics don't make them shut their mouths, let me know and I'll deal with them as I've recently dealt with that increasingly irksome troublemaker, Dr James E. McDonald.'

'McDonald's still around,' Fuller said.

'He's an illusion,' Wilson said.

Instead of explaining what he meant by that cryptic remark, he changed the subject by pointing out that since American astronauts had recently orbited the moon in the Apollo 8 spacecraft and would, indeed, soon be actually taking their first steps upon it, he wanted no reports to leak out regarding the debris of his own previous landings there. He insisted, furthermore, that the UFO reports being submitted with increasing frequency by astronauts were to be treated as the sightings of previously unseen natural cosmic phenomena.

When Fuller agreed, Wilson returned to his flying saucer, leaving the otherwise cynical CIA agent to stare in wonder at its magical ascent until it was lost in the stars.

Time moved on, Fuller realised.

Chapter Forty-Six

A deeply shocked Dwight felt that he was reliving his life. Back in 1952, with his late friend, Bob Jackson, he had passed a newspaper stand in Washington National Airport Terminal Building, seen from the headlines that UFOs had invaded the capital, and felt outrage that he had not been informed. Now, with his old friend long gone, he saw from the headlines, dated December 17, 1969, in the very same airport terminal, that the Secretary of the Air Force, Robert G. Seamans Jr., had just officially announced the termination of Project Blue Book and the Air Force's twenty-two-year study of UFOs.

With his shock rapidly turning into disbelief, reluctant acceptance, anger and despair, Dwight caught a cab and continued on his journey to what could be a crucial meeting with Tony Scaduto. He was dropped off outside a nondescript bar in M Street, not far from where Bob Jackson had died of a 'heart attack' that Dwight then, and now, believed had been murder.

The formerly flamboyant Scaduto was like a different man. Dressed like a Haight-Ashbury hippie, he was smoking a joint of marijuana, drinking too much, and listening, stoned, to a jukebox playing Zager and Evans, Blood, Sweat and Tears, the Rolling Stones, and Jethro Tull, while psychedelic lights flashed on and off the walls. He was also practically gibbering with fear.

'I tell you, man, wow, right,' he babbled, inhaling, exhaling, glancing left and right, avoiding Dwight's accusing gaze and determinedly *not* raising the subject of UFOs or the termination of Project Blue Book. 'What a year, right? I mean, I really dig it that a US astronaut's just become the first motherfucker to land on the moon and that just last month two more astronauts did the same. Superheroes, those guys.'

'There are no superheroes,' Dwight said, already beginning to despair of this conversation; wondering what had happened in the past year to change his young friend so drastically.

‘Yeah, well, right,’ Scaduto continued, rambling while sucking on Mary Jane, putting his head back, closing his eyes, then exhaling slowly, ecstatically. ‘Yeah, but we really beat those goddamned Russkies in the end. That’s one hell of a thing, right?’

‘Right,’ Dwight said. ‘But I really wanted to talk about the termination of Project Blue Book.’

‘Yeah? Well, you know, I really don’t know anything about that, man. I mean, what the fuck, they’ve been trying to kill it off for years, and it was practically dead on its feet even before it was finally terminated. Not much lost anymore, right?’

‘Who do you think was behind it? Jack Fuller’s boys?’

‘Yeah, probably, but who knows? I mean, I don’t wanna know anymore. And neither do you, man. You shouldn’t be goin’ around askin’ questions like that. Things like that can be messy.’

‘I haven’t heard from you in a long time, Tony. You don’t reply to my letters anymore. You never answer the telephone. Have you given up your UFO work?’

‘Yeah, right, I gave it up.’

‘Why’s that?’

‘I just got fed up with it, is all. I mean, I just got the urge to do other things.’ Scaduto raised his fat joint in the air, waved it, then giggled. ‘Yeah, man, other things.’

‘You didn’t just get interested in other things, Tony. Tell the truth: you got scared.’

‘Bullshit!’

‘You’re scared right this second.’

‘Just stoned, man. Bit sweaty. Fuckin’ hot in here. And those lights, man, they make your heart race. It’s the new generation.’

‘You’re a bit old for it, Tony.’

‘I’m okay. I still pull the chicks.’

‘The use of that word “chicks” already dates you.’

‘Okay, man, just lay off.’

Flickering constantly, rapidly in the gloom, like the lights seen on so many UFOs, the psychedelic lights in this crowded bar were creating bizarre patterns on the walls and on the bodies, faces and limbs of the young people packed tightly together, most wearing hippie clothes – baubles, bangles and

beads – and having shouted conversations to defeat the pounding rock music. The sweet scent of pot filled the smokey air. In the disorientating, kaleidoscopic lights, Scaduto looked gaunt and haunted.

Determined to get to the bottom of his young friend's fall from grace, Dwight ploughed ahead. 'So why are you frightened? Did they get to you, Tony?'

Scaduto sighed, releasing smoke through his nostrils. 'Okay, man, I confess. I recently received a visit from three bastards wearing black suits. They claimed to be CIA agents, scared the hell out of me, and demanded that I drop my UFO investigations and forget what I saw over British Columbia. They said that if I ever flew over British Columbia again, I wouldn't come back. They also told me that they knew Hank Lomax had flown the plane, then they told me to give you their regards.'

Dwight was shocked almost rigid. Sitting up straight in his chair behind the small, round table, he found himself squinting instinctively into the flashing strobe lights, trying to see if he was being observed. Realising that he had become paranoid again, on the instant, he then understood, also, just why Scaduto was behaving in this manner. Yes, Scaduto was helplessly frightened – just like he, Dwight, was.

Oh, God, he thought, not again.

Trying to get a grip on himself, he said, 'For the flight from Dayton to Calgary, I was listed under another name. I wasn't listed at all for Lomax's flight. So how the hell could they have known I was present?'

Scaduto threw his hands up in the air, pleading ignorance. 'I swear to God, man, I didn't tell them. If they'd asked, I think I would have, 'cause I was so damned scared, you know? But they didn't ask – they *told* me. Yeah, they told me they knew Lomax was the pilot of the *Tri-Pacer*. Then they said – kinda grinning maliciously – to pass on their regards to you, mentioning you by name. So they knew you were there.'

'Jesus Christ! *How?*'

'I think it was the beam of light. You remember? That pyramid of light that beamed down from the saucer to cut the plane's engine while somehow keeping us up there in the air, still moving forward. That light scorched and destroyed the film in my camera, thus destroying our sole source of proof for the existence of the man-made flying saucers. And I think it also somehow photographed us – or, at least, beamed up an image of us to the flying saucer.

They identified us from that.'

'Oh, my God,' Dwight said, briefly covering his face with his hands and now feeling as frightened as Scaduto looked. 'What have I done?' He removed his hands from his face and stared straight at Scaduto who, in the disorientating, kaleidoscopic strobe lights, looked oddly inhuman. 'What about Beth?'

Scaduto leaned across the table, holding his thick joint between the fingers of one hand while using the other to grab hold of Dwight and shake some sense into him.

'Fuck flying saucers,' he said to Dwight. 'I just want to stay alive. And so should you, man. For your own sake. For Beth's sake. This is the last time we meet, Dwight. Don't ever try contacting me again. I don't exist. I'm invisible. Good luck. Adios.'

He gave Dwight a gentle shove. Dwight pushed his chair and stood up to hurry out of the bar. Once outside, on the busy sidewalk, in the afternoon's wintry light, he caught a taxi straight to the airport. There, instead of catching his return flight to Dayton, Ohio, he took the next plane to Phoenix, Arizona. He had a window seat and during the whole flight he couldn't take his eyes off the sky. He kept imagining he was seeing flying saucers moving silently, eerily through the clouds, but nothing materialised.

Arriving in Phoenix late that evening, Dwight hired a car and drove to a residential area near the University of Arizona, where he booked into a motel for the night. He did not sleep well. Rushing back in upon him, as if stirred by his talk with the equally frightened Tony Scaduto, were all the old dreams of flying saucers and mysterious men in black. Mixed in with such dreams were dreadful visions of Beth surrounded by silent creatures, some human, others alien, bathed in a radiant white light and being probed in the most private places with what looked like surgical instruments. He thought he could hear Beth screaming. In fact, it was himself. He awoke more than once in that interminable, sweaty night, either groaning or screaming.

At ten the following morning, after a breakfast of black coffee (since he could not stomach even the idea of food) and after making a quick call to check that Beth was okay, he drove to the University of Arizona and was escorted to his pre-arranged meeting with Dr James E. McDonald.

Over the past few years, McDonald, who was strongly pro-UFO and anti-

CIA, had become a thorn in the side of the latter, as well as the Air Force. This had led him into taking up freelance work for the APII and it was through this work that Dwight had gotten to know him and respect him. Though very much the scientist, living in a cloistered world, McDonald had taken the bit in his teeth and gone out to fight all those in the CIA and the Air Force who were trying to stifle information about UFOs and intimidate or harass witnesses. He had done so with tremendous energy and a surprising knack for gaining publicity, thus placing the APII more vividly on the map, even while making himself a leading target for those he was exposing. Dwight had to admire that.

Now, however, entering McDonald's office, Dwight was shocked to find that McDonald had changed almost as drastically as Scaduto. A kind-faced, academic man with short-cropped hair and spectacles, he had recently lost a lot of weight and looked like someone in a state of permanent exhaustion. Behind the spectacles, his eyes seemed slightly glassy and distracted, possibly even fearful.

After welcoming Dwight into his office as warmly as possible, given his condition, he confessed that he no longer wished to discuss UFOs and had, indeed, almost refused Dwight this meeting.

'So why did you change your mind and let me come?' Dwight asked, when he was seated in the chair in front of McDonald's desk.

McDonald shrugged and smiled with what seemed like an air of sadness. 'I guess in deference to all we shared in the past. By which I mean our joint work for the APII.'

'You were doing so well,' Dwight said, 'then you suddenly stopped. Why was that, James?'

McDonald stared steadily at him for a moment, then shrugged again, this time forlornly. 'No reason, Dwight.'

'You look terrible,' Dwight said bluntly. 'You look sleepless. What happened, James?'

McDonald was silent for what seemed like an eternity, his gaze focused on the ceiling, then he sighed with what could only be deemed despair and lowered his gaze to look at Dwight – not directly at him, but as near to that as he could manage in his state of chronic distraction.

'All right,' he said. 'In deference to our friendship, I'll tell you this once, off the record, but on the condition that you never visit me again.'

‘Never?’

‘Never.’

Though immeasurably shocked, recalling Scaduto’s dismissal the previous day, Dwight nodded: ‘Okay, I promise.’

There was another lengthy silence from McDonald, as if he was struggling to find the courage to speak, but eventually, with another mournful sigh, he said: ‘About the middle of March last year – I can’t recall the exact date – I went for a night drive into the desert just outside Phoenix, which is something I’ve done often in my life, for relaxation. That particular night, however, I blacked out. I awakened fifty miles from where I had remembered driving... and my car was pointing back in the direction of home.’

‘Just like Beth,’ Dwight said.

‘Exactly.’ McDonald clasped his hands together, placed them on his desk, and studied them distractedly for some time, before eventually continuing: ‘From that day on, I’ve been suffering from dreadful headaches, or migraines, and from the conviction that I’m being observed constantly, in some inexplicable manner. This conviction is so strong that often I think I’m going mad. It’s given me a lot of sleepless nights – in fact, now I’m almost permanently exhausted – and naturally this, apart from its effect on me and my family, hasn’t helped when it comes to dealing with what’s presently going down.’

‘What’s that?’ Dwight asked.

When McDonald next sighed, Dwight realised that it wasn’t really a sigh: it was the gasping for breath that denotes the fierce repression of panic. McDonald spoke softly, in short bursts, catching breaths in between.

‘As you know, since the implementation of the Condon Report recommendations... notably the closing of Project Blue Book and all other... UFO investigations... the forgotten UFO controversy has practically become a... a... forgotten issue in the press.’

‘Yes, I know.’

‘Behind the scenes, however,’ McDonald continued, gradually regaining control of his panicky breathing, ‘the ridicule attached to the study of UFOs has actually... increased. For that reason, as I was still insisting that UFOs were physical, metallic objects and their origins possibly known to the Air Force, I was... ridiculed relentlessly at committee hearings and in the institute as...’ He shook his head in unutterable despair and humiliation. ‘As a man

who believes in little green men and other science fiction or comic book inventions. Now most of my serious work is being ignored and my career is in… jeopardy.' He glanced down at his desk again, studying his hands, then managed to redirect his troubled gaze to Dwight. 'If what happened to me in that desert is the same as what happened to Beth, then God knows what they did to me when they got to me. I feel that I'm being… controlled. Not just watched, but… manipulated. And now, like Beth, I'm haunted by dreams of UFOs and men in black – of being inside a flying saucer, surrounded, blacking out. And because of that I'm now exhausted from lack of sleep, my career's crumbling, and my marriage is rapidly breaking down. I'm in trouble in more ways than one, Dwight, and that's why this is finished... So… I've told you. Now don't ever come back here. I'm sorry, Dwight. Goodbye... and good luck.'

Feeling as if he was going mad, Dwight stood up, shook McDonald's hand, then left the building. After driving too quickly, dangerously, to the airport, he commenced the first leg of his journey back to Dayton, Ohio.

As with the flight in, he asked for a window seat and spent the whole of both flights staring through the window at the clouds below. He kept thinking there were objects down there, but again nothing materialised.

Feeling ever more fearful, Dwight picked up his car where he had left it in the airport in Dayton and headed for home as quickly as possible, growing ever more fearful for Beth's welfare.

It was already dark when he left the airport. Once away from the ugly clutter of the industrial belt, with its gas stations, warehouses, and factories for the production of refrigerators, air-conditioning equipment, cash registers, machine tools and, especially, aircraft instruments, the land became emptier, mostly agricultural land, pretty in the daytime, but flat and featureless in the darkness, though the sky contained a large moon and a spectacular display of stars. There were few clouds – just some candyfloss wisps here and there – but enough to cast shifting shadows on the broad, moonlit fields.

Dwight drove pretty fast, too frightened for Beth to be careful, trying to distract himself with the feeling of power, of magical omnipotence, that came with being isolated from the world while moving through it at great speed. He normally loved the land at night, the play of shadow and light, but tonight, given the couple of days he'd just had, he felt threatened by it.

Then he started feeling odd... no longer alone... aware of some unseen presence.

'What the hell...?'

He spoke aloud to break the silence, suddenly frightened of being alone out here, then he instinctively glanced at his rear-view mirror.

He saw only dark clouds crossing the stars and reaching out to gently stroke the moon.

Nothing else... just the darkness... the stars seeming to move away… the sky unfolding radiantly in his wake as the car barrelled forward. Nothing else in the mirror...

Yet his heart started racing.

He glanced left and right, convinced that something was out there. Seeing nothing, he glanced up, where there was nothing unusual, so once more he concentrated on the road straight ahead, uncomfortably aware that he had started sweating.

'Damn it, Dwight!' he whispered to himself. 'It's just your overwrought imagination – that's a dangerous thing.'

Talking to himself... Speaking aloud to calm his nerves... There was nothing out there but moonlit darkness, starlit sky, shifting shadows...

No, something *was* out there... What was that? Something moving... A flashing light... Growing bigger... Approaching.

Yes, damn it, *approaching*!

He saw the light, then it was gone, though it hadn't flashed on and off. It had flown from east to west at tremendous speed, then maybe shot upwards – so fast it just disappeared.

Where was it now?

Dwight felt his skin crawling with a dreadful, clammy fear. He was aware of something out there. He couldn't see it, but he could *feel* it, and his hands became slippery on the steering wheel as his heart raced in panic.

'Imagination!' he whispered again, trying vainly to convince himself that this was the truth... Then, as his helpless fear deepened, something flashed in his eyes.

He almost swerved off the road, but blinked and straightened out. He squinted into the darkness, trying to see between the headlights. Seeing nothing, he looked to the side.

A pool of light was brightening on the road beside the car, keeping abreast

of it, speeding along and growing brighter and wider until it covered the whole road.

Dwight glanced up and was blinded by dazzling light... then he lost control of the car.

'Damn!' he exclaimed, his voice reverberating in his head as he fought with the steering wheel and the car swerved off the road, out of the light beaming down, then back onto the road and into the light again. 'Jesus Christ! What the...?'

The light disappeared abruptly. The car barrelled into the darkness. Its headlights had gone out and Dwight frantically worked the switch... and then a bass humming sound, an infrasound, almost *physical*, filled the car and tightened around his head as the engine cut out.

Dwight slammed on the brakes. He went into a skid, managed to straighten out, and was slowing down when something passed above him, shot into the darkness ahead, then became an enormous, burning globe that froze right in front of him.

The car came to a halt. It just rolled to a stop. Dwight sat there, hardly believing what he was seeing, but too stunned to move.

He was looking at a huge, slightly glowing flying saucer that was hovering in mid-air farther along the road, almost as wide as the road. It had a silvery, metallic appearance, no surface protuberances, and possessed a perfectly seamless surface beneath that eerie white glowing.

Dwight sat in the car, too stunned to move, mesmerized as the flying saucer sank lower and settled on the ground. It didn't appear to have any legs – it just settled down on its base. No, not quite on the ground: a few inches above it; hovering just above the ground. Then the bass humming sound increased, tightening around Dwight's head, as he saw a large panel opening up in the sloping surface of the saucer, emitting a brilliant light, then falling forward to form a ramp that led down to the ground.

Three figures walked down the ramp, the smaller two moving awkwardly, to spread out across the road and make their way to the car.

Dwight was terrified. The middle figure was a tall, slim human being dressed all in black, but the other two, one on each side of him, were creatures little more than four-foot tall, wearing silvery-grey coveralls, but with studded helmets on their heads, lower faces made of moulded metal and devoid of noses or lips, and hands that looked from Dwight's point of view

like vicious steel claws.

They looked like creatures from another world.

As they deliberately advanced upon Dwight, spreading out as they came closer, emerging from silhouette, he wanted to get out of the car and flee, but he felt paralysed.

Then the infrasound faded away and the tightness left his head. Instantly, he reached out for the ignition key and turned it, but heard only a dead click. Jerking his hand away, imagining that it had been scorched, he tried to still his racing heart as he waited for the two alien creatures and the man in the middle to reach the car.

One of the alien creatures stopped right in front of the car, the other went to the far side, and the tall, silvery-haired man dressed all in black walked around to stop by Dwight's door.

When he bent down to look through the window, Dwight wanted to scream.

'Roll the window down, Dwight.'

The man's voice was almost a whisper. It was also oddly flat. It was the voice of a man with no feelings but a lot of authority. Dwight did as he was told. He didn't seem to have a choice. That voice, though quiet and unemotional, would brook no disobedience. Dwight rolled the window down, his hand shaking, then he stared at the man.

He had silvery-grey hair, unnaturally smooth white skin, curiously immobile, handsome features and icy blue eyes.

'You're Dwight Randall,' he said.

'That's right,' Dwight responded.

'You were with Project Blue Book at the ATIC, then you worked for the APII.'

'That's right as well,' Dwight said.

The man smiled without warmth. 'You also flew over a construction plant in British Columbia and saw some of our saucers.'

'Yes,' Dwight confessed.

'You will stop this, Dwight. From this moment on. You've already done considerable damage to your wife, and could do a lot more. As for your friends, Tony Scaduto and the meddlesome Dr McDonald, you've seen the state they're in – and let me assure you that they're going to get much worse. Is that what you want for yourself, Dwight?'

'No.'

‘For your wife?’

‘No.’

‘Your daughter?’

‘Please, no!’

‘Well, if you don’t want that to happen to your wife and daughter, not to mention yourself, you must stop your involvement with UFOs and never return to it. Do you understand?’

’Yes.’

‘Good. However, just as a precaution, Dwight, to ensure that you keep your promise, I’m going to give you a final warning. Not right now. Not this year. Maybe next year. It will happen when we feel that you’ve had enough time to consider all this and have to make a decision about whether or not to stay silent about us. This warning will help you make the right decision should you be feeling less fearful.’

‘What kind of warning?’ Dwight asked.

The man offered his chilling smile. ‘Wait for word about your friend Dr James E. McDonald. When it comes, you will know. That will be your final warning. The next in line will be you and your family, should you ever again displease us. Do you understand, Dwight?’

‘Yes.’

‘Then return to your home and look after your family. Goodnight, Dwight. Goodbye.’

Dwight felt that he was dreaming. In his dream the fear returned. He kept thinking of Beth and Nichola, of that warning, and then he knew for certain that he would stop here.

‘Goodnight,’ he replied.

The tall, silvery-haired man with the oddly immobile features offered another chilling smile and a nod before walking away with his two hideous cyborgs, back to the enormous flying saucer. He and the cyborgs walked up the ramp and disappeared back into the saucer’s brilliantly lit holding bay while Dwight sat on in the car, still unable to move. The saucer’s ramp lifted up and folded back in until it again became part of the seamless body, cutting off the light and leaving the saucer to reflect the moonlight from its metallic surface. Then Dwight heard the bass humming sound, almost *felt* it, an infrasound again, and as his head started tightening, as his skin turned numb, the flying saucer started glowing, its silvery body brightening magically, until

it became encased in a cocoon of pulsating white light and lifted off the ground.

Dwight heard the noise, *felt* it, was surrounded by it and became part of it, as the saucer ascended slowly, gracefully – yes, even majestically. Then it abruptly shot upwards, about a hundred feet up, but stopped again, just as abruptly, as if by pure magic, to hover high above and to the side, where he could just about see it.

The infrasound cut out, allowing Dwight to move again, though he didn't dare get out of the car. The saucer looked small up there, about the size of a dime, and it seemed to be spinning on its vertical axis and filling the sky with light. Then it shot up even higher, shrinking rapidly, but still shining, until eventually it merged with the stars and suddenly blinked out.

Dwight saw the moon and stars, the vast web of the cosmos. They made him think of the beauty and terror of life... and of those whom he most loved and who were obviously most threatened: Beth, Nichola, and Nichola's baby, still only eight months old.

Determined to protect them, he turned the ignition key, heaved a sigh of relief when the engine came on, and drove home as quickly as possible, obsessed with the notion that his family might have been visited by the man who had just left and, even worse, that they might be captives in that flying saucer this very moment.

He was therefore overwhelmed with gratitude and love when he found that Beth, though telling him that she had been visited by men in black and tormented by a UFO that circled over the house the previous evening, was unharmed, as were Nichola, her husband, Larry, and their baby, named after Bob Jackson.

Nevertheless, when he took Beth in his arms to kiss her, he knew that both of them were still in danger and would probably remain so for the rest of their days. Though he suspected that he could never hide from that nameless man for long, he was determined to try.

'We're selling up and going to Oregon,' he told Beth, 'where you've always wanted to live. It's time we moved on.'

'I understand,' Beth responded. 'It's all ended, hasn't it?'

'Yes,' Dwight said. 'It's ended.'

His kiss told her the rest of it: that love, which could not protect a single soul in the world, could at least heal old wounds and soothe fear. It was a kiss

of renewal.

Chapter Forty-Seven

Eighteen months later, in June, 1971, Dwight had settled comfortably into his new life with Beth, Nichola, her husband Larry and baby Bob in a rambling old farmhouse in Vida, Oregon. Out of deference to Nichola's fears for her own child, as well as for Dwight and Beth, Larry had generously agreed to give up his job as a civilian engineer with Wright-Patterson AFB in Dayton, Ohio, and move with them in relative anonymity to Oregon, where he settled for a job as a maintenance engineer with a private airline that combined commercial flights to local towns with crop-dusting. Dwight, on the other hand, was happy to get a job as a truck driver, delivering farm produce to the shops of the various small towns in the area. Nichola looked after baby Bob, while Beth looked after Nichola and the baby, as well as tending the house. All in all, it was a quiet, pleasant life in pastoral, postcard countryside dominated by the spectacular Cascades mountain range where, as Dwight often recalled, some of the earliest and most famous flying saucer sightings had been made.

Dwight knew in his heart of hearts that if that nameless, silvery-haired man or any of his equally mysterious friends wanted to find him, they would doubtless be able to do so – and, indeed, probably knew where he was right now. Nevertheless, the move to Oregon had not only been made to satisfy one of Beth's oldest desires – she had always yearned to live in Oregon – but to let 'them' out there know that Dwight had moved away from all his former associates and was now living in relative obscurity.

In other words, he was telling 'them' that he had well and truly retired from the UFO business.

As if being thanked for keeping his word, Dwight was pleased to note that Beth's nightmares and physical 'hauntings' had ceased within days of their leaving Dayton and had not returned in the eighteen months they had been living in Oregon. As for himself, since leaving Dayton he had not seen or heard anything of a disturbing nature, and he was grateful for that.

During that eighteen months, few days had gone by when Dwight did not think of the many years he had spent in search of UFOs, but he certainly harboured few regrets. Gradually, however, as the more frightening recollections began to dim in his memory – or, at least, to seem less frightening than they had been at the time – he began to think increasingly about finding a way to impart all he had learned about the man-made flying saucers to those who could use the information best, notably Dr Frederick Epstein and Robert Stanford of the APII in Washington DC.

Mere weeks after he had commenced this line of thought, he was reminded of that nameless, silvery-haired man's threat to send him a warning through Dr James E. McDonald.

He started thinking about that warning about a week before the warning actually came. Wondering why, suddenly, he could not get Dr McDonald out of his head, he endured an emotionally troubled week, then decided to take a day off and go fishing in the local lake. Arising just after dawn, he drove into Vida, picked up the local newspaper, then drove on to the lake. Still sitting in his car, he poured a cup of hot coffee from his thermos flask, then settled back at the steering wheel to read the newspaper.

Instantly shocked, he sat forward again, resting the newspaper on the steering wheel to prevent it from shaking.

The first page contained an article stating that two days ago, Dr James E.McDonald, B.A. in Chemistry, M.S. in Meteorology, Ph.D. in Physics, Professor of the Department of Meteorology, and Senior Physicist at the Institute of Atmospheric Physics of the University of Arizona, after suffering from depression and a broken marriage, had committed suicide by driving out into the desert in the middle of the night and shooting himself in the head with a pistol

Shocked, Dwight let the newspaper slide off the steering wheel, onto his feet, as he stared over the lake, at the Cascades soaring beyond it, thinking about what he had been told through what he had read.

Dwight was absolutely convinced that McDonald, though he may indeed have shot himself, had not committed suicide – he had merely pulled the trigger. Though the evidence would never come in, Dwight sat there in his car, looking at the distant Cascades, where the whole UFO flap had first begun, and tried imagining the most likely scenario, given what McDonald had previously told him.

Dwight's hypothesis, based on his own knowledge of UFO abductions, Beth's personal experience, and McDonald's confession to him, was as follows...

Already in a bad way after a combination of overt Air Force and CIA harassment and inexplicable set-backs in his formerly illustrious career, then suffering additionally from severe depression and a broken marriage, McDonald awakens in the middle of the night, puts on his normal clothes, including suit, shirt and tie, and goes down to his kitchen for a hot drink. Sipping his coffee, he recalls the visit he had from the impassioned Dwight Randall who, like him, had gradually become obsessed with UFOs. McDonald then broods on how a relentless barrage of private and public ridicule is being used against him, to discredit his professional credibility.

Of all the ridicule he has suffered, nothing has been worse than when the House Committee on Appropriations called him to testify about the supersonic transport (SST) plane and how its use would affect the atmosphere. McDonald had discovered (correctly) that the SST would reduce the protective layer of ozone in the atmosphere and that this could cause an additional 10,000 cases of skin cancer each year in the United States, as well as having other dramatic effects on animals, crops and the weather.

During his testimony, however, McDonald was constantly ridiculed as a believer in flying saucers and 'little men flying around the sky' and treated generally as someone deranged.

Sitting at his kitchen table in the middle of the night, brooding about this, as well as the loss of his wife and career, McDonald takes a pistol out of a drawer under the table and thoughtfully studies it. As he does so, an almost palpable bass humming noise, an infrasound, fills the room and an eerie, pulsating light pours in through the window. McDonald clutches his head and moans in pain until the light and sound fade away. He then looks up with tears in his eyes and walks out of the house, still carrying the pistol.

McDonald gets into his car and then drives into the desert beyond Phoenix, taking the same route he had taken a few years ago when he had first blacked out during a night ride.

He parks in the middle of the desert and stares up at the vast, star-filled sky.

An enormous UFO in a pulsating aura that changes repeatedly through the whole spectrum, filling the night with colour and light, descends until it is

hovering just above him, blotting out the glorious sky and revealing only a pitch-black, swirling base that appears to have no depth.

As McDonald stares up at the terrible beauty of that sight, he has fragmented recollections of being picked up by the same craft when last he parked here...of being carried up to the stars... and of being deposited back on Earth much later, his head as tight as a drum.

Eventually, as the infrasound increases, deafening him, while making his head tighten even more, creating appalling pain, McDonald obeys an inner voice – the one voice he cannot resist – and helplessly raises the pistol to his head and presses the trigger.

His last memory – if such it can be called – is of an exploding galaxy.

He falls forward and dies.

Dr James E. McDonald was now only an illusion of the mind, a warning to Dwight that he should not change *his* mind and attempt to pass on his secrets to Frederick Epstein, Robert Stanford, or anyone else.

Thus, when Dwight, still in his car, managed to regain control of himself and shake off his shock, he lifted the newspaper off his rubber boots, clambered out of the vehicle, threw the newspaper into a rubbish bin and then walked down to the edge of the lake. Once there, he climbed carefully into his boat, rowed out to the centre of that great bowl of water, then unreeled his line and sat down to fish, surrounded by the Cascades. Thoroughly distracted, he let the boat drift where it would as he gazed at the sky above the distant, snow-capped mountain peaks.

He had the distinct feeling that the flying saucers were still out there, gliding eerily through the clouds, keeping him under surveillance... and he knew that this feeling would haunt him for the rest of his days.

He sat there all day, drifting aimlessly in the boat, patiently waiting for the stars to come out... and even then, when the stars had come out, he didn’t find peace of mind.

He could not feel safe even out here.

It was best to be silent.

GENESIS

Projekt Saucer, Book 3

The international bestseller that started it all…

More than a gripping, enthralling novel of brain-searing excitement, ***Genesis*** is a reading experience you will never forget…

In these pages you will enter a world of nightmarish global conspiracy and perverted super-science that will both horrify and fascinate you. You will see the hidden forces of technological evil massing to obliterate those who threaten to reveal their appalling existence. And, in the totally unexpected and chilling climax, you will witness one of the most powerful testaments to the strength of the human spirit in adversity ever to appear in a work of fiction…

'A Herculean conspiracy epic… superbly written, crammed with food for thought.'

THE WRITING GAME

Recollections of an Occasional Bestselling Author

THE WRITING GAME is an autobiographical account of the life and times of a professional writer who has managed to survive the minefield of publishing for over thirty years.

Unlike most books on the subject, ***The Writing Game*** does not try to tell you how to write, or even how to get published. Instead, it focuses with gimlet-eyed clarity on the ups and downs of a unique, always unpredictable business.

On the one hand, a compelling look at a life lived on the edge, under the constant threat of failure, both artistic and financial, on the other, an unusually frank self-portrait enlivened with colourful snapshots of editors, fellow authors and show business celebrities, ***The Writing Game*** succeeds, as few other books have done, in showing how one professional, uncelebrated writer has managed to stay afloat in the stormy waters of conglomerate publishing.

Here, for the first time, a working author tells it like it really is.

PROJEKT UFO
The Case for Man-Made Flying Saucers
W. A. Harbinson

W.A.Harbinson's groundbreaking non-fiction work, *Projekt Saucer: The Case for Man-Made Flying Saucers*, details the extraordinary facts behind his bestselling novel, *Genesis.* Widely regarded as one of the most detailed and level-headed books ever published on this controversial subject. *Projekt UFO* is also considered by many to offer the definitive explanation for a mystery that has haunted the Western world for over sixty years. Now this revelatory book about 'the world's most fearsome secret', first published in 1995, is again available to a worldwide readership.

This new edition has been updated by the author.

'A fascinating account of the history of UFOs, but from the perspective of their being man-made, not extraterrestrial craft... Forget ETs and invasions from space; the terrestrial scenarios Harbinson speculates are already frightening enough!'
-Nexus

'For sheer content and quantity, this book must score ten out of ten. It covers a multitude of topics including biblical encounters, airship scares, spinning disks, World War II sightings, UFO landings, UFOnauts, and much more. A very worthwhile addition to your stack of bedtime reading.'

You will see the hidden forces of technological evil massing to obliterate those who threaten to reveal their appalling existence. And, in the totally unexpected and chilling climax, you will witness one of the most powerful testaments to the strength of the human spirit in adversity ever to appear in a work of fiction…

'A Herculean conspiracy epic… superbly written, crammed with food for thought.'

PROJEKT UFO

FOR URSULA

NOVEMBER 23, 1944

It began when the B-25 had crossed the Rhine and was starting to make its bombing run over darkened Germany. The other aircraft had already made their first run when Lieutenant Tappman, twenty-one years of age and out of Denver, Colorado, studied the cross hairs of his bombsight, watched the last of the indices join, and prepared to trip away his load of five-hundred pounders.

The first bombs were already exploding, tiny flames in the black void, the flat drifting far below, the tracer bullets like fireworks, when Tappman blinked and saw the pulsating red lights winking on and then vanishing. ‘What the hell – ?’ the pilot said. ‘Jesus Christ!’ a gunner added. The intercom crackled, voices rising and falling, then the Plexiglas nose was briefly filled with crimson light as three globes of spinning flame shot up vertically and vanished above.

Tappman blinked and shook his head, heard the coughing of the engines, felt the aircraft shuddering strangely and levelling out and heading away from the target zone. A spasm of fear lanced through him, an instinctive dread of the unknown, and he promptly pressed the button on his throat mike and said, ‘What the hell’s happening there?’ The intercom crackled. ‘What was *that*?’ The copilot said. ‘I don’t know,’ the tailgunner replied. ‘I saw lights – three red lights.’ Tappman looked into his bombsight, saw the cross hairs over darkness, cursed softly when the engines malfunctioned and the plane shuddered again. ‘You’re going off course!’ he shouted. ‘What the hell are you up to? I can’t see a damned thing from here! Is it enemy aircraft?’ The plane shook and dropped again, climbed back up, levelled out, the intercom

crackling, metallic voices colliding. '*Red lights! Something burning! No, they're climbing! Jesus Christ!*' And then Tappman was dazzled, the night filled with spinning flames, and the burning globes spread out around the plane and then started to pace it.

The plane shuddered and rolled, went into a shrieking dive, barrelling down through streams of tracers and black mushrooms of flak, the blazing buildings of Germany far below, illuminating the darkness. 'Pull her up!' Tappman bawled his eyes blinded by purple flares. 'What the hell's going on? We're cutting out! *We're down, you dumb bastards!*' The plane roared and shook violently, levelling out, its wings quivering, and Tappman saw his jack-plug dangling loose and jammed it back into the intercom. 'They're still with us!' the pilot was shouting. 'What *are* they?' the gunner wailed. The nose shuddered and pointed upward, heading through the tiers of flak, the plane's engines sounding healthy again as it started to climb.

Tappman looked for the balls of fire, saw nothing, rubbed his eyes, felt isolated in the bombardier's compartment at the end of the crawl-way. 'What are you doing?' he bawled, seeing yellow fires below, the ugly black clouds of flak around him, hearing muffled explosions. 'We cut out!' he shouted. 'We went dead! *What's going on out there?*'

The intercom crackled, the tailgunner's voice wailing, fading in and out, back in again, sounding close to demented. 'What are they?' the gunner wailed. 'They're right beside me! I can't hit them! I can't make them out! They're not conventional aircraft! *What the hell are those things?*'

Tappman cursed and glanced around him, not believing what he had seen, wishing he could see them again, filled with dread and excitement. '*What?*' the pilot bawled. 'Spinning balls!' the gunner wailed. 'Balls of fire! I'm not sure! They look like balls of fire and they're spinning! Oh, my God, *now there's more of them!*'

A sudden silence, then the static, then the roaring of the guns, someone

screaming and then the plane rolling as if out of control. Tappman cursed and shook his head, glanced up to see the sky, the dark clouds and the smaller clouds of flak, the silvery web of the tracers. '*Drop the bastards!*' the pilot bawled, wanting the bombs to be released, wanting his plane to be freed of its load and climb out of the chaos. '*I can't!*' Tappman whispered, working the controls to no avail, the fear racing back in to smash his senses when the engines cut out again. '*We're going down!*' someone screamed.

The plane shuddered and went silent, started rolling, falling fast, Tappman trapped in the nose cone with the Earth far below him. He heard the static, someone wailing – the tailgunner or copilot – and looked below, following the line of the falling plane, to see the fires of the air raid. 'What *are* they?' the gunner cried. 'The engines are dead!' the pilot bawled. 'They're not planes!' the gunner cried. 'They're balls of fire! Jesus Christ, *now they're climbing!*'

The engines roared back into life, as if controlled by the balls of fire, the plane levelling out and heading through the tracer bullets and the black clouds of flak. Tappman groaned and licked his lips, simply forgot to release his bombs, jerked his head around and saw a crimson light that fanned out across the dark sky. '*What's that?*' Tappman shrieked, not recognising his own voice, his heart pounding as he searched for the German fighters and saw only the crimson light. 'I don't know! the pilot bawled. 'They're right behind us!' the gunner screamed. 'They're pacing us!' the copilot joined in, his voice high and distorted. '*They're killing our engines!*'

Tappman glanced all around him, closed his eyes, looked again, saw the crimson glow spreading across the darkness at the side of the nose cone. Then the engines malfunctioned, started spluttering into silence, coughed into life once again and made the plane jerk unnaturally. Tappman shrieked some mindless plea, hardly aware of his own voice, staring out through the glinting Perspex to see a strange ball of fire. 'Jesus Christ!' he whispered to no one, his eyes wide and disbelieving, seeing that spinning ball of fire, then another,

then a third, suddenly recalling all the stories he had heard and never believed. '*Foo fighters!*' the gunner screamed, his voice distorted by the intercom, reverberating in Tappman's head and then fading away as the plane hurtled Earthward.

'We're going down! *Pull her up!*'

Tappman grabbed hold of himself, closed his eyes, embraced the nightmare, felt his body being pressed back into the chair as the plane kept on falling. The plane fell an endless mile, shuddering violently, spinning wildly, but it reached the ground eventually, plunging into it, exploding, Tappman hearing a crazed voice wailing '*Foo!*' which is where it all ended.

CHAPTER ONE

Shortly after noon on March 6, 1974, a battered, two-toned Pontiac passed through the gates of Winslow Air Base, Arizona, and headed directly for the Air Traffic Control Tower. The car moved leisurely but smoothly past the administration blocks and hangars, sunlight flashing off its windows, its wheels churning up red dust, the soft droning of its engine drowned out by the roaring of the aircraft either taking off or landing. There were white clouds in the blue sky, the planes glittered above the mountains, and the clouds were like banks of pure snow in a clear, azure lake.

When the car eventually stopped at the glass-and-concrete control tower, the driver climbed out slowly, closed the door with some care, locked it, then glanced keenly around him. This man was short and broad, insignificant in his dark suit, his white hair dishevelled and his green tie hanging loose, the tanned fingers of his right hand reaching up to stroke a grey Vandyke beard. He was no longer run, was in fact just over sixty, and his face was a sunburnt webbed map of reflection and fatigue.

After glancing briefly at the surrounding mountains, the man reached into his jacket pocket, withdrew a billfold, flipped it open and dangled it before the civilian guard. The guard was tall and impassive, dressed in black shirt and pants, and he studied the identity card, fingered the holster on his hip, distractedly stroked the peak cap on his head and then nodded assent. The old man smiled bleakly, returned his billfold to his pocket, winced when an airplane roared overhead, passed the guard, went inside.

The stairs were made of concrete, uncovered, painted white, and they led up

through silence and a dim half-light to the more pronounced semi-darkness of the Approach Control Room. The old man glanced at the elevator, considered it, rejected it, took a deep breath and climbed up the stairs, breathing fitfully, wearily. Finally reaching the top, facing a steel-plated door, he let his racing heart settle, tightened the knot in his tie, buttoned his jacket and then pushed the door open and closed it quietly behind him.

The Approach Control Room was dimly lit, the numerous radarscopes flashing, the walls banked with computers and flight maps and schedule charts, the air traffic controllers bunched around the consoles, hair short, sleeves rolled up. The old man blinked and coughed, his hazel eyes scanning the gloom, then he raised one hand and distractedly stroked his beard, the noise and dim light confusing him. The air controllers all talked at once, telephones rang, radios crackled, and the colored lights of radarscopes and computers flashed on and off constantly.

The old man coughed again, raised a hand and waved it languidly, watched his friend detaching himself from a group and coming toward him. His friend was young and flashy, his flowered shirt open-necked, the chain belt on his white trousers gleaming as he shook the old man's hand. He did this and then stepped back, glanced around him, grinned and shrugged, then stepped forward again, took the old man by the shoulders and shook him affectionately.

'You look good,' he said.

The old man smiled wearily, smoothed his thinning grey hair, looked around him, eyes squinting, bathed in muted orange light, stroked his beard and then loosened his tie and looked back at his younger friend.

'I don't feel as good as I look,' he said. 'Now what's this emergency.'

'I'm sorry I had to – '

A weathered hand waved. ‘It’s all right,’ the old man said. His accent was faintly European, his voice soft, almost hesitant. ‘Just tell me what’s happening.’

The younger man was slow to answer, his fingers playing with the gleaming belt, He glanced uneasily around him and then reluctantly looked back at the older man.

‘We found Irving,’ he said.

Something happened to the old man, something almost imperceptible, a spasm of shock, a fleeting fear or despair, before he blinked and automatically stroked his beard and then regained control again.

‘You found him?’

‘Yes, Frederick. He’s dead.’

The old man looked at the floor, rubbed his eyes, glanced around him; he saw the glowing radarscopes, their orange light on men’s faces, the men casting long shadows on the floor, on the humming computers. He felt fear at that moment, the dry, familiar fear, a helpless dread that had enveloped his past and now mapped out his future. He looked back at his young friend, at the blond hair and blue eyes, saw the multicolored darkness all around him, making him unreal.

‘Suicide?’ the old man said.

‘So it seems, Frederick. They found him an hour ago, on U.S. 66 – in his car, just beyond Valentine, a gun in his hand.’

‘U.S. 66?’

‘That’s right. Apparently Mary never even saw him leaving. She’s staying in the house on Camelback Hill, and I just rang her and she didn’t sound well.’

‘No,’ the old man murmured. ‘Obviously not.’

‘Anyway,’ the young man said, ‘the usual. Mary says he hadn’t been sleeping well lately, that he’d been getting up in the middle of the morning and just wandering about the house, looking out the windows, looking up, obsessed by the whole thing. She thinks he must have done that this morning – got up when she was asleep – only this time he didn’t wander around: he took their car and drove off. The cops found him an hour ago. He’d shot himself in the mouth. I told them to hold off till we got there. We better go now.’

The old man closed his eyes, shook his head from side to side, opened his eyes again and glanced around him, his face taut with grief.

‘Poor Mary,’ he whispered.

The young man took his elbow, led him out of the control tower, down the stairs, through the door, past the guard, around the dusty old Pontiac. The noon sun blazed down upon them, upon the airstrip across the road, burned a monstrous white hole in the sky above the hazed, blue-ridged mountains.

‘We’ll leave your car here,’ the young man said. ‘We won’t be gone very long. We’ll just fly out there and find out what we can and then I’ll bring you right back.’

The old man stroked the Pontiac, wiped the dust from his hand, glanced across the baked plain, eyes squinting against the sun, then dutifully followed the young man. The air base was busy, planes taking off and landing, a constant noise and movement above them as they crossed the hot tarmac. The old man was sweating, mopped his forehead, felt the wind – a fierce wind that emanated from a roaring and made his eyes narrow even more. His young friend was just ahead, ducking low, waving frantically, urging him on toward the red-and-white 47G helicopter that had just burst into life on its landing pad.

The rotor blades whirled, becoming a blur that whipped the dust up, turning the dust into a localized whirlwind that enveloped the old man. He almost stumbled, righted himself, covered his mouth and cursed softly, then his free hand held his jacket against his chest as he followed his friend.

The helicopter roared and shuddered, its short steel ladder rattling, and the younger man, already inside, reached down with one hand. The old man was pulled up, slipped in behind the pilot, and promptly strapped himself into his seat as his friend closed the door. Then his friend sat down beside him, the helicopter shook and climbed, and the old man, visibly relieved, stared out through the Perspex.

He felt grief and outrage, an uncoiling, chilling fear, looking down, Winslow shrinking below him, remembering other days, other deaths. Suicide, he thought. We all finally commit suicide. There is never a reason nor a motive, but it's always a suicide. Of course he didn't believe it, never had, never would. He looked down on the mountains, on the barren, rock-strewn earth, on the saguaros and ocotilla and barrel cacti, and felt the fear creeping over him.

'How do you feel?' the young man said.

'About what you'd expect.' The old man stroked his beard and rubbed his eyes. 'I feel for Mary. How awful.'

The helicopter dipped and climbed, sunlight flashing all around it, and the engine made a fierce, relentless roaring that drummed in their ears.#

'We have a flap on,' the young man said. 'That's why I'm out at the air base. There's been sightings all over the goddamned place, and they're keeping us busy.'

The old man stared through the Perspex, saw the buttes and wind-carved valleys. 'There's been a flap for the past *fifteen months*,' he said, now looking

sideways, smiling gently.

‘White Sands,’ his friend continued. ‘Los Alamos and Coolidge Dam. Visual sightings and radar reports, all unidentified returns solid.’ He shrugged his shoulders, ran his fingers through his blond hair. ‘I don’t know,’ he said. ‘It kinda makes me shiver. These things know where they’re going.’ He looked at the old man. His bearded friend did not respond. ‘Weird,’ he said. ‘So how did your year go? How are things at the institute?’

The old man sighed. ‘Very busy,’ he said. ‘It’s been the biggest flap since 1967 and we haven’t had breathing space.’

‘Anything solid?’

‘Too many to discuss.’ The old man saw mountains far below, the desert stretching around them. ‘I just wish we could catch one.’

The young man smiled. ‘I want to pay you a visit,’ he said. ‘But you keep all these things in your head; fill me in just a little.’

‘There were hundreds,’ the old man said. ‘Every conceivable kind. High-level, low-level, distant, actual contact; electrical and mechanical interference, numerous car-chasing incidents; mental and physical effects on people, animals similarly affected; landings with genuine traces left behind, the materials still unidentified. So, there were plenty.’

‘Jesus,’ the young man said. ‘Jesus Christ.’

‘Good witnesses,’ the old man said. ‘All reliable witnesses. We’ve never had such quality before. Most encouraging. Quite heartening.’

‘Irving said that.’

‘Irving’s dead,’ the old man said. ‘Irving told me he had found something important… now Irving is dead.’

‘I can’t hear you,’ the young man said.

‘Alright, I’m sorry.’

‘Tell me about some sightings,’ the young man said. ‘Who in hell are your witnesses?’

‘Policemen,’ the old man said. ‘We’re running a survey on police sightings. A policeman isn’t prone to hysteria and he’s trained to observe.’

The old man stroked his beard, offered a sigh, studied his hands. The helicopter roared in his ears, making his head throb.

‘October 17, 1973,’ he said. ‘In Waverly, Illinois, in the early hours of the morning, the police chief and three citizens observe an object with green-and-red flashing lights. They watch the object with binoculars for an hour and a half; it gives out glowing embers that fall to the ground, then disappears as abruptly as it arrived… Los Angeles: police officers are summoned to investigate an object on the east side of the city; on arrival the officers see an oblong, bluish-white, very bright object which, when their car moves toward it, rises at a forty-five degree angle to an altitude of about fifteen hundred feet and then speeds off… Palmyra, Missouri: several high-school students report that a bizarre object with flashing lights has appeared over the Missouri River, beamed a spotlight on a passing barge, lit up the entire river bottom, circled the river quite a few times, and approached onshore spectators before taking off vertically and disappearing. Four days later, Palmyra citizens *and* police observe an object with red, white and amber lights on it, plus two powerful headlights in front; this object silently and slowly circles the whole town at low level, and only when police officers shine a spotlight on it does it finally move away and disappear…’

‘Okay, you’ve convinced me.’ The younger man grinned, shook his head from side to side, glanced sideways at the old man, looked away, saw the silvery-blue sky. ‘Any contact? Anything verifiable?’

‘Not with the police.’

The old sighed, a muted hint of defeat, played distractedly with the collar of his rumpled shirt, his hazel gaze on the desert. The helicopter was vibrating, roaring and rattling about him, lifting up and then dropping down again in a sickening fashion. The old man kept looking down, seeing the mountains and valleys, the red earth, the scorched, writhing rocks, a world untouched by time… No, that wasn’t so: nothing there had remained untouched. He looked down on Two Guns, Winona, Humphrey’s Peak, thought of all that had lived there and passed away because it no longer mattered. The land below was haunted, the dust settling over history, erasing the Apache and the Mojave, the Papago and the Pima, the Hopi and the Hualapai and the Yavapai, the Maricopa and Paiute. The Spanish *ricos* had disappeared but lonely missions remained, their walls bleached by the sun and eroded by fierce, abrasive winds, their ancient bells red with rust. Arizona was unreal, a dream of legend and myth, its prairies crossed by Kit Carson and Billy the Kid and Wyatt Earp, still sheltering the reservations and pueblos, the sad remains of the Indians. The old man stared down and shivered, felt the clinging, familiar fear, tried to reconcile the past with the present and its possible future. He thought of the White Sands Proving Ground, of Alamogordo, New Mexico, of Los Alamos and what it represented: the ever-threatening Atomic Age. Yes, the future was here and now – in aeronautics and atomic research. It was also in the lights in the sky that now obsessed the whole world.

‘There has of course been contact,’ the old man said. ‘Bu, alas, not with policemen.’

‘The Air Force?’

‘Doubtless. But not announced.’

‘No. Those bastards wouldn’t.’

The old man stroked his beard, looking more tired each minute, a slight,

almost imperceptible shiver running down through his body.

‘Still,’ the young man said, ‘I think we’re becoming more respectable. Did you know that on 21 February this year Monsieur Robert Galley, the French Minister of Defence, gave an interview on *France-Inter* in which he stated categorically that UFOs exist, that the phenomenon over France was massive, that they were considered of definite interest to national defence, and that since 1970, in collaboration with the *Gendarmerie*, all information regarding French sightings has been passed over to the *Groupment d’Etudes des Phenomenes Aeriens* for investigation? I also note that this very month the American Institute of Aeronautics and Astronautics has revitalized its UFO committee. So, not to pun, things are looking up.’

The old man seemed lost in thought, fingers scratching at his beard, looking slightly impoverished beside the more colorful presence of his younger friend. When he finally spoke, his voice was soft and remote, as if divorced from him.

‘I’m tired,’ he confessed. ‘I’m growing old and I’m tired. I’ve been at this business for twenty-five and I’ve had too many friends kill themselves. I’m not tired. I’m just frightened.’

His young friend did not reply, merely gazed down at the desert, momentarily embarrassed into silence, knowing what the old man meant.

‘You’ve heard of Calvin Parker and Charles Hickson?’

‘Yes,’ the young man said. ‘The Pascagoula case.’

‘Remarkable,’ the old man said. ‘The publicity was astonishing. A close encounter of the third kind that even Hynek was inclined to believe. When was that? Was it last year?’

‘Yes,’ the young man said. ‘You’ve got the year right. The mouth of the Pascagoula River in Mississippi. A hell of a buzz.’

‘Some can’t be broken down,’ the old man said. ‘Some are just beyond reasoning.’ He closed his fist and coughed into it, shook his head as if disgusted, rubbed at his eyes and glanced down, saw the stark, shadowed mountains. ‘Route 114A near Manchester, New Hampshire. November, 1973, at four in the morning. Driving home from work, a twenty-five year old woman – checked out, highly intelligent – notices a bright orange light that repeatedly vanishes and reappears in the sky ahead. About seven miles farther on, the object is much closer than before, much lower, much larger. Estimated as being about sixteen hundred feet in front of her, it is ball-shaped and honeycombed with various hexagons. The object has a translucent quality about it, with red, green and blue rays emanating from its center; and it is making a steady, high-pitched whining sound that makes her whole body tingle. Briefly, as follows… Though frightened, the woman is unable to remove her hands from the steering wheel and feels that the object is somehow drawing her car toward it. There is a memory-loss during a half-mile stretch. Recovering, the woman finds her car hurtling at the object, which is now about thirty feet above the ground. Still driving, and about five-hundred feet from the hovering object, the woman notices a widow and an occupant inside, the occupant framed waist-up by the window. Description: head greyish, round, dark on top; eyes, large and egg-shaped; skin under the eyes loose or wrinkled. The witness didn’t notice any eyes or ears, though this may not mean anything… The witness seemed to be genuine.’

‘Any trace cases?’

‘Too many to recount.’

‘Actual contact?’

‘Yes, your Pascagoula case.’

‘That,’ the young man said, ‘was a humdinger.’

‘Greyish skin again. Conical appendages for nose and ears. Round feet and

hands, crablike claws, lot of wrinkles, no eyes recalled.'

'But five feet tall.'

'Yes.'

'Almost human.'

'That's right. Almost human…'

The old man's voice trailed off, was drowned out by the roaring helicopter, which was turning and dipping toward the earth, sunlight flashing around it. The old man felt ill, his stomach rumbling, heart fluttering, as he looked down on Dinosaur City, a gleaming maze in the desert.

'We'll soon be there,' his young friend said.

'Good,' the old man said. 'I want to get this over and done with. I'm not as young as I used to be.'

'Well, you're still working. You've kept the institute going. I'm glad you haven't given up yet. You're doing valuable work there.'

'I hope so. I'm not sure. We can only do a limited amount. On the other hand, we *are* more organized these days – and nowadays they cooperate.'

'The Air Force?'

'Yes. To a certain extent. However, what's more important – indeed, as you've just said – is the fact that witnesses from all walks of life are coming forward more willingly. The crank reports are now almost at zero, while reports from flight personnel, astronomers, and even astronauts, are being received at an astonishing rate. We now have a computer data bank for analysis of reports and storage of information. Areas covered include medical examinations of people and animals affected, psychological studies of

witness reliability, theoretical studies of UFO movements and properties, photographic and special graphic analysis of UFOs, and analysis of plants that a UFO may have affected. In short, we're covering the subject pretty thoroughly.'

The young man smiled, flicked blond hair from his blue eyes, glanced briefly at the pilot in front, then looked again at his older friend.

'I believe it,' he said.

'And now Irving.'

'Jesus Christ… yes… I'm sorry.'

They fell silent after that, both plunged into gloom, each locked into his personal concept of what might have happened. The helicopter rolled and dipped, started shuddering and falling, and looking down they US 66, curving back toward the mountains. The old man rubbed his eyes, the sun dazzling him, blinding him, then he reached for the knot in his tie and nervously tightened it.

'There they are,' his friend said.

The old man looked down, saw the dark line of the road, a ribbon winding around buttes and through valleys, shades of green, rose and lavender. Panic came and then departed, left him drained and forlorn, silvery sunlight exploding around him and then disappearing, leaving blue sky, white haze, a flock of dark birds, a jagged barrier of mountains in the distance, a stream of dense clouds above them.

The taste of death and its aftermath; the accumulation of fresh pain… His heart pounded and he let the fear depart and opened himself to his anger. He was old, most assuredly, growing older every, but gazing down upon the highway, seeing it widen and rush up toward him, seeing the police cars and the ambulance and the men around the other car, he let the rage wash away

his grief and fear and charge his blood with new life. That was Irving down there. Back in Phoenix, Mary wept. The old man coughed and muttered and oath and sat back looking grim.

‘I don’t believe this,’ he said.

The helicopter dropped lower, roared louder, shuddered violently, brown rock and parched grass and yellow cacti racing up to enfold it. Looking down, he saw the police cars, the ambulance, the milling men, the latter staring up, waving hands, shading eyes, the red dust being swept up by the helicopter and swirling around them. The helicopter moved on, crossed the road, still ascending, and then settled down a couple of hundred yards from the road. There was a bump, a brief shaking, a creaking subsidence, then peace, the engine whining into silence, the rotor blades finally stopping.

‘Okay, you guys,’ the pilot said loudly. ‘Here we are. It’s all yours.’

The young man with the blond hair and colorful clothes unsnapped his safety belt and stood up. The old man was slower, fumbling clumsily with his belt, finally managing to unsnap it and rise, breathing harshly, laboriously. There was a rattling and banging, a beam of sunlight poured in, then the pilot slid the ladder through the doorway and motioned them outside. The young man went out first, held his hand up to the older man, took his elbow and guided him down the ladder to the safety of solid ground. The air was filled with swirling dust. The old man coughed and blinked repeatedly, shaking his eyes with one hand; he felt the sudden, claustrophobic, burning heat and then followed his young friend. They kicked sand and trampled shrubs, saw a lizard, a line of ants, then they arrived at the edge of the road and saw their friend, Irving Jacobs.

Irving was in his car, his face flattened against the steering wheel, the back of his head blown away, a bloody mess all around him. His arms hung down by his sides, the wind rippling his shirt-sleeves, and his face was turned slightly toward them, staring at them with dead eyes.

‘Oh, my God,’ the young man said.

The old man said nothing, simply shuddered and turned aside, tightened his tie and then took a deep breath and looked slowly around him. He saw police cars, the ambulance, the white-clad medics, the milling cops, then a fat man wiping sweat from his forehead walked over to him.

‘Stanford?’

‘No, I’m Stanford.’ The young blond man stepped forward. ‘I’m sorry to have kept you all this time. I had a bit of a hold-up.’

The fat man stared at Stanford, wiped from sweat from his face; he was big, but that didn’t stop his gut from flopping over his belt.

‘I’m Toland,’ he said. ‘Captain Toland. Homicide. I don’t know what you birds want out here, but you better be quick. He’s startin’ to stink already. He’s been cooked by the sun. He shot himself early this morning. Put the gun in his mouth.’

‘*What gun?*’ the old man asked.

‘Who are you?’ Toland said.

‘I’m sorry,’ Stanford said. ‘This is Dr Frederick Epstein. Of the Aerial Phenomena Investigations Institute in Washington. I told you I’d bring him.’

‘Washington, eh?’ Toland said, mopping sweat from his brow. ‘He must be a big fish.’

‘Not big at all,’ Epstein said. ‘He was just a close friend. Now what’s this gun you’re talking about? My friend didn’t own a gun. In fact, he didn’t even know how to shoot one. I can assure you of that.’

‘You don’t have to know how to shoot one to blow your own head off.’ The

captain pulled out a handkerchief, mopped the back of his neck, glancing around at the cops taking measurements and photographing the dead man. ‘You just unclip the safety catch,’ he said, looking down at Dr Epstein, ‘and stick the barrel in your mouth and squeeze the trigger. That’s all there is to it.’

‘He didn’t own a gun,’ Epstein repeated stubbornly. ‘He wouldn’t have known where to buy one.’

‘What are you, Doc? A scientist?’

‘That’s right. I’m a scientist.’

‘You sound pretty melodramatic for a scientist. You can buy a gun anywhere.’

Epstein glanced at Stanford, saw him shrugging his shoulders; he glanced briefly at the dusty red Ford: at the policemen around it. The cops were dressed in tan, wore dark glasses and brimmed hats, seemed threatening with their pistols and clubs, murmuring jokes, laughing raucously. Epstein saw the side of the car, the door open, an arm dangling. Beneath a limp hand the sand was stained with a patch of dried blood. Epstein shuddered and turned away, felt anguish and choking rage, rising out of himself and floating back to take a grip on his future. Captain Toland was staring at him, towering above him, gazing down, his fat face burned by sun and desert wind, his shirt rumpled and sweat-soaked.

‘It was a Luger,’ Toland said. ‘A German Luger. We’ve wrapped it up for the lab boys.’

‘He wouldn’t have bought a gun,’ Epstein said.

‘Then he stole it,’ Toland said. ‘He got a Luger and he shoved it into his mouth and that’s all there is to it.’

‘I don’t believe that,’ Epstein said.

‘Jesus Christ,’ Toland said. He turned his head and looked appealingly at Stanford. ‘The Doc thinks it was murder.’ The thought clearly amused Toland, made him grin and scratch his belly; then he turned back to Epstain, held his shoulder, and said, ‘Here, come with me, Doc.’

They went around some lounging cops, past the ambulance, toward the Ford, Epstein feeling a deep surge of revulsion at the sight of that dangling arm. Then he looked down at his friend, saw the bloody, shattered head, turned aside and lowered his gaze to see a dark stain on red earth.

‘Don’t look at him,’ Toland said. ‘Just take a good look around you. Tell me what you see or what you don’t see. Just have a good look.’

Epstein did as he was told, a small man, tired and grim, rubbing nervously at his beard and looking around him, his hazel eyes lined with age. The desert lay there before him, scorched eternally by the sun, rolling away between the buttes, into valleys, the distant mountains in blue haze. Stillness. Desolation. His gaze returned to the men around him. The medics had taken a stretcher from the ambulance and were advancing on the dusty red Ford. They dragged Epstein’s friend out, a dead thing, meat and bone, and he choked back his revulsion and rage, looked once, turned away again. The sky, the white clouds, the ochre mountains beneath them; the mountains fell to the wilderness floor that stretched across to his feet.

‘I don’t know what you mean.’ He said.

Toland sighed with satisfaction, twisted his body, glanced around him, then waved one hand languidly at the road, at the tracks of the vehicles.

‘Those tracks there,’ he said. ‘The tracks right in front of you. They belong to your friend’s car and there isn’t the trace of a skid mark: he drove up here and stopped.’ Toland waved his hand again, indicating more tire tracks –

tracks criss-crossing each other and spread out to the police cars and ambulance. ‘He was found by our patrol car. There were no other tracks here. Those tracks you see belong to our vehicles – before we came, there was nothing. Just one set of tracks – your friend’s tracks – there were no other vehicles. Our own car was the first to find him. No other cars had passed this way. No tire tracks, no footprints. No nothing. He did it all on his own, Doc.’

Epstein didn’t reply, simply stood there deep in thought, his unfocused eyes becoming more alert when they fell on the medics. They were at the rear of the ambulance, one inside, one on the ground, Irving Jacobs strapped tightly to the stretcher that was tilted between them. Dr Epstein stepped forward, touched his friend’s face with his fingertips, shook his head from side to side as if bewildered, then stepped back and just watched. The stretcher was hoisted up, the gleaming doors were slammed shut; the remaining medic ran around to the driver’s seat and waved once and climbed in. The ambulance roared into life, the wheels churned the dust up, then it reversed and turned around and moved off along the desert road. Epstein watched it departing, didn’t move until it was gone, then he sighed and returned to young Stanford, who was looking perturbed.

‘Jesus,’ Stanford said, ‘that was awful. How the hell could he do it?’

Epstein opened his mouth to speak, changed his mind, shrugged forlornly, glanced around and tightened his lips with distaste when Captain Toland approached him.

‘That’s it,’ Toland said. ‘We’re going back now. They’ll do the autopsy in Phoenix. You have any more questions?’

‘No, Captain,’ Stanford said. ‘No more questions. Thanks for your help.’

‘No sweat,’ Toland said, the sweat pouring down his face, dabbing at his neck with the handkerchief, his grin directed at Epstein. ‘It’s all part of the service.’

He turned away and walked off, his broad hips rolling rhythmically, a pistol slapping up and down on one fat thigh, flicking sweat from his brow. The other cops were in their cars, the cars reversing in clouds of dust, then screeching, wheels churning up more dust as they burned off down the road. Toland turned back and waved, his flushed face split by a grin, then he clambered awkwardly into his own vehicle and it rumbled away. Stanford stood beside Dr Epstein. They watched the cops drive away. They waited until all the cars had disappeared in the distance, then they turned, the dust settling around them, and walked back to the waiting helicopter.

‘Okay?’ the pilot asked.

‘Okay,’ Stanford said. ‘Homeward bound.’

They strapped themselves into their seats and Epstein loosened his tie, wiping sweat from his neck with his hand as the helicopter took off. They ascended toward the sun, the sky dazzling, a blinding haze, Epstein glancing down on Route 66, the drifting dust of the wilderness.

‘How’s your love life?’ Epstein asked.

‘Pretty regular,’ Stanford said.

‘You’re picking up a bad reputation.’

‘I know it. I love it.’

‘I thought you were marrying some girl.’

‘Yes, I was. I just changed my mind.’

‘You could never make decisions,’ Epstein said. ‘That’s your major weakness.’

Stanford grinned and nodded agreement. Epstein smiled and patted his arm.

The helicopter climbed higher, the land spreading out below, and Epstein suddenly leaned forward, his eyes widening, filled with shock, and reached out to take Stanford by the shoulder and shake him impatiently.

'Your flap!' he snapped. 'New Mexico and Arizona. You mentioned the Coolidge Dam.'

'That's right,' Stanford said.

'Any more?' Epstein snapped. 'Apart from Coolidge! *Did you have any more?*'

Stanford was startled. 'Shit, yes,' he said. He stared hard at his old friend, at his flushed, impatient face, and was taken aback to see the brightness in his eyes, an almost feverish intensity. 'All over the place,' he said. 'A constant flap the past three days. Over Glendale, over Prescott, over Tucson and Eloy, over Flagstaff and Sedona and Sunset Crater – the whole goddamned show.'

'*Look down there!*' Stanford hissed.

Stanford looked down. He saw US 66. He saw the spot where Irving Jacobs had been found, the rocky earth all around it. Then he blinked and looked harder. A shiver ran down his spine. He suddenly saw the rippling soil, the concentric rings of dust and sand, the rings surrounding the spot where Irving had been found and running out a great distance. It was like the thumbprint of a giant, the rings like whorls on the earth, as if the dust and sand had been blown away by some awesome explosion. Stanford blinked and looked again. He couldn't believe what he was seeing. The thumbprint was half a mile in diameter, the earth scorched at its edges.

'Oh, my God!' Stanford said.

The helicopter climbed higher, turning away from the sun, and neither Stanford nor Epstein said a word as they flew back to Winslow.

CHAPTER TWO

The man who stepped off the luxury cruiser onto the Puerto Banus yacht harbour near Marbella, southern Spain, was tall and sophisticated, wearing a black shirt and slacks, his eyes hidden behind dark glasses, his hair silvery but plentiful, parted neatly on the left and falling down over an oddly seamless forehead. He stood briefly on the dock, surveying the massed boats of the rich, then he turned in a sharp, decisive manner and walked alongside the many restaurants. Most tables were taken, the clientele suntanned and elegant, wearing bikinis and gaudy shirts and sunglasses, gazing up at the mountains' haze. The man in black ignored them, walking slowly and thoughtfully, only stopping when he arrived at the Sinatra Bar, looking in, entering warily.

The interior was bright and cool, almost empty, quiet, one young lady at the far end of the bar, a single man near the entrance. This man was middle-aged, rather plump, dressed in a white suit, the jacket bulging slightly just above his left hip where a pistol was undoubtedly strapped. He glanced up and grinned, a practised smile, nervous, then he lightly patted the high stool to his left, his fingers glittering with rings.

'Ah,' he said, 'Mr Wilson!'

Wilson nodded curtly, but remained in the doorway, removing his glasses and blinking azure eyes, staring along the bright room. The young woman was tanned and lovely, blonde hair trailing down her spine, breasts and crotch emphasized by her bikini, the long legs crossed invitingly. Wilson stared at her, studied her, saw the indolence of the rich, and then, satisfied that she was

harmless, he stepped forward to take a high stool beside the white-suited man.

‘*Buenas días,*’ the white-suited man said. ‘It’s been a very quiet time, *señor*.’

‘That sounds promising,’ Wilson said.

‘I think so, Mr Wilson. There’s been nothing unusual at all. The work’s all been routine.’

‘No visitors?’

‘Not a knock on the door.’

‘I feel better each minute.’

A short, dark Spanish girl emerged from a door behind the bar; seeing Wilson, she started moving towards him. Wilson smiled pleasantly, but shook his head from side to side, and the girl, with a slight, knowing nod, turned away to clean glasses.

‘You’re not drinking?’ the man in white said. ‘Your trip didn’t give you a thirst?’

‘Not for wine, Fallaci. Just for rest. I am here to relax.’

Fallaci nodded and sipped his *vino,* his rings glittering around the glass, then he glanced at the young lady along the bar and slowly turned back to Wilson.

‘I had a telephone call this morning. From our friends in Arizona. They said to tell you that Irving Jacobs is dead. It’s been announced as a suicide.’

‘How unfortunate,’ Wilson said. ‘At least for him. I would like to leave now.’

Fallaci licked his lips, turned away and snapped his fingers, causing the Spanish girl to smile and walk up to him, blue-jeaned hips swaying sensually.

‘*Cuanto*?’ Fallaci said.

‘*Ciente pesetas, señor*.’

Fallaci put his money down on the counter. ‘*Muchas gracias*,’ he said.

Sliding his legs off the stool, he followed Wilson through the doorway, the sun blinding, flashing off the white walls, the rolling boats, the blue water. Fallaci blinked and squinted around him, at tanned thighs, a string-bikini, then he saw the upraised hand of Mr Wilson, heard the snap of his fingers.

‘Where’s the car?’ Wilson asked.

‘This way,’ Fallaci said.

‘We’re not in public now,’ Wilson said.

‘Sorry, sir. This way, sir.’

They walked along a narrow street, the high walls painted white, the balconies of the apartments overhead casting shadows around them. The street was cool and short, but opened out to a monstrous heat, a dazzling haze that enveloped the parking lot and shimmered over the dusty cars. Fallaci walked on ahead, his leather shoes kicking stones, one hand upraised in agitated motion, flicking sweat from his brow. He stopped at a black limousine, opened the rear door, waited patiently, let Wilson slip inside and settle down before closing the door. When this was done, he glanced about him, a portly figure, no longer suave, then he opened the driver’s door and clambered in and switched on the ignition.

‘How was Paraguay, sir?’

‘It was hot,’ Wilson said. ‘Now please get me there as quickly as possible. I have much work to do.’

Fallaci flushed, feeling reprimanded, released the hand brake, stepped on the gas, and the car moved off smoothly, winding out of the parking lot, eventually turning onto the road to Fuengirola and picking up speed.

Wilson sighed and sat back, glanced through the window, saw the traffic, the parched brown-and-ochre hills rolling up to the sky, desecrated by white-walled *urbanizationes*, the influx of foreign wealth. Wilson grimaced with distaste, lowered his gaze, looked straight ahead, saw the dark hair on the back of Fallaci's head, the road racing toward him. Then he smiled and leaned forward, pressed a button in the back of Fallaci's seat, heard a humming as the glass pane slid down and cut him off from his driver.

The rear of the car was soundproofed, air-conditioned, well cushioned, with a drinks cabinet, telephone and Video-TV recording system all built into the back of the front seats. There was a mirror above the cabinet. Wilson studied his own reflection. He saw a deeply tanned, strangely ageless face, blue eyes cold with intelligence. Wilson sighed, feeling removed from all his years, then he unhooked the cassette-recorder microphone and started to talk.

'One. General. The British Mercantile Airship Transportation Company, in collaboration with Plessey, are presently working on an experimental prototype of a Thermo Skyship. The Skyship, which has been developed under the general leadership of Rear Admiral David Kirke, is shaped like a flying saucer with its engines positioned right around the rim. Estimated diameter: six hundred and fifty feet. Approximate weight: five hundred tons. The machine is reputed to get its lift partly from helium and partly from hot air generated by the swivelling jet engines. Envisaged speed at the moment is one hundred miles per hour, but almost certainly this will be improved upon. The British Defence Ministry has expressed interest in this machine with a view to speeding the Rhine Army into battle in any future conflict; and it has been confirmed that the Royal Navy has also expressed interest in the possibility of using the Skyships for North Sea Oil defence… File for review.

'Confirmation received that for the past ten years the United States Air Force

has been observing and photographing the secret Soviet laboratory at Semipalitinsk where it is believed the Russians are developing an extremely powerful beam weapon capable of destroying intercontinental missiles at almost the speed of light. The beam is thought to comprise atomic or sub-atomic particles – electrons, protons or ions – equivalent to billions of volts of electricity and accelerated toward the target at just under one hundred and eighty thousand miles per second. John Allen, senior US government scientist, has stated that a weapon of this type now appears to be possible; and both George J. Keegan, head of USAF Intelligence, and Dr Willard Bennett, member of the US team that was obliged to abandon beam-weapon work in 1972, believe that the Russians are well ahead of the Americans in this field… Regular surveillance of the Semipalitinsk laboratory is recommended.

'In July of 1985 NASA plans to launch a new, solar-powered, ion-engine space craft whose purpose is to fly to Halley's Comet and circle Temple 2. A space shuttle will carry the spacecraft into Earth orbit and then a dual-engine Inertial Upper Stage booster will propel the one thousand six hundred kilogram probe into an interplanetary orbit, after which the fuel boosters will drop off and the solar-powered ion engine will take over the three-year, low-thrust voyage to Temple 2… File for review.'

Wilson switched the mike off, pursed his lips, glanced outside, saw the towering apartment blocks sweeping past, the mountains soaring beyond them. This stretch of road was ugly, scarred by hotels and building sites, the original villages now bustling, gaudy towns, filled with tourists and drifters. The old Spain was dead and the new expanded every day, spreading out along the Costa del Sol like a malignant cancer. It was the dawn of Democracy, that old dream that devoured itself, and Wilson, with his ruthless intelligence, was appalled by the sight of it. He a sighed, pursed his lips, heard the humming of the limousine, then sank deeper into his seat and switched the mike on and started talking again.

‘Two. Prosthetics. Work is progressing at a dangerous rate on the artificial heart, lung, gut and gill, as well as artificial cells, blood vessels, intestines and even skin. Artificial bones, joints and sockets are being used with increasing success, the main alloys being of the cobalt and chromium variety: tantalum, titanium, niobium and molybdenum. Blood vessels, heart valves, bone, skin, blood and the cornea of the eye have all been preserved artificially. Skin, stored in DSMO for periods of years, has been successfully grafted to the human body by researchers at the University of Pennsylvania School of Medicine. Bone frozen for years and then revived with cobalt radiation has also taken when grafted to the body. Likewise, red blood cells have been freeze-dried for years, and now tissue banks are disturbingly common. Indeed, it has been pointed out that the US Navy tissue bank recently supplied some three thousand square inches of human skin to Brazilian fire victims… Request further research.

‘External prosthetics. Myoelectric control is advancing every day, with the Soviets reportedly making the greatest advances in this field. Intelligence indicates that the Soviets have already perfected a hand-arm prosthesis in which all five fingers are capable of closing around objects of variable shape with the precision of a human hand. British scientists have developed, among other items, myoelectric arms with interchangeable hands; while in the United States a team of scientists and engineers from Harvard, MIT and Massachusetts General Hospital have developed a sophisticated myoelectric arm that moves at any angle, speed or force simply by being *thought* into action. This arm picks up muscle signals generated to the natural stump, transmits them to a small amplifier, and uses them to drive a compact electric motor; the machinery for all this is housed inside a flesh-colored, fiber-glass casing that resembles a real arm.

‘Researchers at the Powered Limbs Unit of West Hendon Hospital in England have come up with what amounts to an implantable electrode, or transmitter, called an Emgor. This uses a resonator circuit that does not require batteries to detect myoelectric signals, thus obviating the need for

frequent surgical intervention to replenish the power source. It is to be noted that amputees so treated are actually capable of *unconscious* gesticulations – and that similar lower-body prostheses have now been developed to the stage where some surgeons are willing to perform hemicorporectomies: amputation of the entire lower half of the body, including legs, rectum and genitalia. This procedure has already been offered to patients in a prominent New York hospital as an alternative to death by abdominal cancer… Request further research.'

The car turned off the main road, bumping over rough ground, and Wilson looked out to see the surrounding hills, the fields of olive trees and wheat. They passed a scattered *urbanizatione*, the villas whitewashed and gleaming, gardens parched by the sun, the earth hard, a fine dust on the Moorish walls. Wilson studied the place casually, noting the swimming pools and bikinis, the tanned limbs of the expatriates lounging in deck chairs, around low tables. Oblivious. And superfluous. The real world would pass them by. Wilson smiled and settled back, observed Mijas high above, this his blue eyes turned bright and intense when he started to talk again.

'Three. Gerontology. Dr Richard Hochschild of the Microwave Instrument Company of Del Mar, California, has discovered that adding DMAE to the drinking water of mice increases their life span significantly. Other researchers have successfully employed centro-phenoxine to delay lipofuscin buildup in the brain of guinea pigs; likewise, phenoxene is being used experimentally in France to improve the mental abilities of senile patients.

'Along the same lines, Dr Horace T. Poirier is closed to developing a number of compounds that increase life by as much as fifty percent in mice. These include Vitamin E, mercaptothylemine, BHT, Santoquin and sodium hypophosphite, an old drug used for the treatment of tuberculosis. Also being utilized is DMAE, dimethylaminoethalol, a lysome membrane stabilizer which strengthens cells against damage caused by lipofuscin accumulations… Eliminate Poirier.

‘An increasing number of scientists now believe that the program for ageing is encoded in the hypothalamus-pituitary system. Among these are Dr Joseph R. Wiseman of Chicago, who has successfully reactivated the estrus of aged female rats by stimulating the hypothalamus with electric impulses; he has also reactivated the ovarian cycles of the old females by feeding them L-Dopa, a dopamine stimulator also used in the treatment of Parkinson’s disease, as well as hormones such as progesterone, epinephrine and iproniazid… Eliminate Wiseman.

‘Dr Saul A. Terkel, director of the Gerontology Research Institute, Richmond, Virginia, now believes that if life-extension was to become a national priority like the space program, and if the Americans, Russians and Japanese were to join hands in a billion-dollar assault on aging and death, this could produce dramatic results in five years. Terkel has pointed out that such a program would cost no more than these countries now spend on the maintenance of old-age homes. Now, backed by the full authority of the Gerontology Research Institute, Terkel is lobbying Washington DC with disturbing success… Eliminate Terkel.’

The car climbed the mountain road, bouncing over large stones, passing modern *urbanizationes* and archaic farmhouses, just occasionally passing a Spaniard on a donkey, field hands bent in labor. Wilson frequently glanced out, observing the white haze of the sky, a thin ribbon of grey cloud above the mountains, the dizzying sweep of the valleys. The past was crumbling beneath the present, the future advancing to devour both, and Wilson sat there, recalling his many years, the broad terrains he had traveled. Then the limousine slowed down, took the left fork in the road, heading away from Mijas, toward Alhaurin el Grande, as Wilson closed his eyes and opened them again and talked into the microphone.

‘Four. Telesurgery and telepsychiatry. Telediagnosis is now being utilized between Massachusetts General Hospital and Boston Logan International Airport, between numerous California hospitals, and between two hospitals in

Edinburgh, Scotland. Also, a telesurgery linkup has been established between Massachusetts General Hospital and the Bedford Veteran's Administration Hospital eighteen miles away. In all of these areas the computer becomes more predominant.

'It is also to be noted that many bioengineers are now claiming that computer and human brain will soon be directly linked. Said R. M. Page of the US Naval Research Laboratory: "The information which a machine can obtain and store from a person in a few minutes will exceed the fruits of a lifetime of man-to-man communications." As to method: "The coupling mechanisms to carry out the functions will be myriad, including in some cases electrical connections to the body and to the brain. Some connections may be wireless, with imperceptible transmitting elements implanted in the body."

'Further note: Geneticists Harold P. Klinger and Orlando J. Miller, speaking before an international symposium on fetology, suggested that what was needed in the United States was a national registry of hereditary abnormalities to help prevent the conception of defective children. This system would have to be implemented via all newborn children when their skin and blood samples would, as a matter of course, be fed into a computerized genetic scanner which would immediately establish the presence of any chromosomal abnormalities and print them out on data cards that would be kept on permanent file in Washington DC. Computer analysis of current ethical attitudes on this subject is required. Please action.'

Wilson switched off the microphone and gazed through the window to see the mountain village of Coin. The car went through the village, barely noticed by the Spaniards, and traveled on down a steep, winding road, between shadowing rows of olive trees. Wilson leaned toward the console, pressed a button, ejected the cassette tape, dropped the tape into his shirt pocket and then sat back impatiently. The car eventually emerged to sunlight, to flat fields strewn with rubble, and moved uphill and then leveled out and headed straight for Wilson's house. It was hidden between parched hills, well

protected by a high-walled compound, the walls featureless, made of rectangular breeze-blocks that had never been painted. The walls were twenty feet high, their tops covered with barbed wire, the only entrance being a wooden door broad enough for the car. The whole compound was solid, completely hiding the house within, standing four-square between the surrounding hills like some stark, lunar fortress.

The car stopped in front of the compound and Wilson remained in the rear seat while Fallaci walked up to the door. Wilson silently watched him, saw him pressing the buzzer, read his lips when he talked into the box and gave the code word for entrance. Fallaci then returned to the car, slipped inside, waited patiently; then the door moved up on metal grooves and Fallaci drove inside.

'Here we are, sir,' he said.

Wilson sat on impatiently, drumming his fingers on the seat, and Fallaci flushed and hurried out of the car and opened the rear door. Wilson clambered out, stretched himself, looked around him, neither pleased nor disturbed to be back, simply checking the compound.

The compound was empty, graveled earth between walls and house, no flowers, no trees, no outbuildings… just open space to be crossed. There were spy-cameras on all the walls, turning back and forth, high up, their lenses shaded from the sun, equipped with infra-red beams for night-time viewing. The house was linear, functional, a rectangle of brick and glass, about a hundred feet long, about fifty feet wide, the roof flat, the structure two stories high, the two front doors made of solid steel. The numerous windows were broad and high, made of bullet-proof, one-way glass. Constantly moving above each of the windows were more scanning devices.

Fallaci approached the front door, glanced at Wilson, pressed a button; the door opened and Wilson entered the building, and Fallaci then followed him. The latter closed the door behind him, pressed another button to reset the

alarms, then stood there with his hands behind his back, his full attention on Wilson.

‘I’ll have a fruit and nut cereal,’ Wilson said. ‘And a glass of white wine. Very dry. Very cold.’

Fallaci nodded and departed, disappearing through a nearby door, then Wilson walked along a corridor to his study. The walls were bland and impersonal, covered in spray-on felt fabric, no decoration, just digital control panels filled with flickering green numerals. Wilson studied them on the move, noting temperatures, power levels, then he turned into his study, into silence, subdued lighting, the fiber-glass Jacobean oak panels looking just like the real thing. He sat behind his desk, at a panel of tiered buttons, pressed a button and then sat back in his chair and studied the screens above him.

There were six screens in all, banked in two rows of three, all set into the wall in front of the desk and wired to a scanner. There were scanners all over the building, outside and inside the compound walls, in the bedrooms, in the toilets, in the garage, and they were all wired for sound. Wilson surveyed the whole place from here, controlled its temperature and lighting; he could open and shut doors at wall, plunge the place into darkness.

The screens flickered into life, the pictures monochrome but sharp, showing the kitchen, the servants’ quarters, the laboratory, each from a variety of different angles. The spy-cameras moved constantly, showing the whole of each room, and Wilson switched the different receivers on and off, surveying the whole house. For the most part it was empty, the rooms vague in subdued lighting, the walls covered in fibre-glass and spray-on felt, the furniture sparse and functional. The building was almost futuristic, oddly sterile and impersonal, an abode for transient guests, the silence heightening the strangeness.

Wilson switched back to the kitchen, observed Fallaci and the crippled dwarf, both standing in front of a gleaming cooker unit, Fallaci mopping his sweaty

brow. The dwarf was a disgusting sight, his spine bent, his legs twisted, his right hand a metal claw a metal claw that was strapped to his arm with wires running into a small pack at his waist. It was a primitive prosthetic and the dwarf was tired of it, forever begging Wilson to fit him with a new one, always being refused. Now Wilson smiled bleakly, reached down to press a button, saw Fallaci and the dwarf look up promptly at the camera above them.

'Hello, Ruediger,' Wilson said to the dwarf. 'How are you feeling these days?'

'Ah, ah,' the dwarf stuttered, his metal claw opening and closing spasmodically, his eyes blinking above a queerly flattened nose and thick, dribbling lips. 'Ah, ah… all right… You know, sir… *all right*… I think… I mean… *sleepless*.'

'Sleepless? Wilson said. 'You mean nightmares?'

The metal claw waved indecisively, hinges opening and closing, passing over the luminous, frightened eyes to scrape saliva from the dribbling lips.

'Ah… nightmares… Ah, yes, sir… bad, ah… *very* bad… Every night, *all* nights, ah… *nightmares*… Can't *sleep* at night.'

'That doesn't sound good,' Wilson said, still smiling bleakly. 'When did this start?'

The metal claw waved more frantically, the dribbling lips opening and closing, the crippled dwarf in a positive anguish of speaking, trying to force the words out.

'Ah, ah… *start*? When you left, sir… *Always*, sir… always then… When you leave… the fear… dreadful *nightmares*… too frightened to leave here.'

'You should have gone out,' Wilson said. 'I told you: you can leave anytime

you wish. I'm sure the break would have helped you.'

'Ah, ah… *grateful*, sir… Tried to go out… but couldn't do it… Too frightened… *very* frightened… of what's out there… Too many bad dreams.' The claw opened and closed, steel fingers snapping at air, the dwarf's head rolling helplessly on stooped shoulders, lips dribbling constantly. 'So glad you're back, sir… So relieved… *Please*, sir… want you… *help me*!'

'Go to your room,' Wilson said soothingly. 'Close your eyes. Try to sleep.'

'Please, sir… Please, no… The *nightmares*!'

'No more nightmares,' Wilson said soothingly. 'I am back. No more bad dreams.'

The dwarf trembled with emotion, waved his claw, muttered his gratitude, then turning away, glancing nervously at Fallaci, he shuffled out of the kitchen. Fallaci remained where he was, still looking up at the camera, a sharp image on the montor screen above Wilson's blue eyes.

'He's been orderly?' Wilson asked.

'Yes, sir, he's been fine. I tried to force him out once or twice, but he was too scared to go. It worked just like you said it would.'

'Good,' Wilson said. 'I'll have my meal in ten minutes. I'll relax for half an hour after that. You can send the girl up then.'

'Yes, sir,' Fallaci said.

Wilson pressed another button, putting the monitors on automatic, then he withdrew the cassette tape from his shirt pocket and slotted it into the console. When the recorder turned itself on, Wilson started to talk again.

'Five. Brain research. Electrical stimulation of the brain, ESB, has recently

become dangerously innovative. The suggestion that computer-controlled electrodes be implanted in the brains of babies a few months after birth, thus robotizing them for life, has already been made by Curtiss R. Schafer in a paper he presented to the National Electronics Conference in Chicago some time ago – and while such a suggestion may have been made half in jest, it is now clear that such devices have moved out of the realms of animal experimentation and into the human arena with volunteer subjects wired for electro-sleep, electro-prostheses, electro-vision, electro-analgesia, electro-anaesthesia and, increasingly, electro-sociology.

‘Dr Jose M. R. Delgado, professor of physiology at the Yale University School of Medicine, and Dr James Olds of McGill University in Canada, have both experimented with the so-called pleasure centers of the human brain, as has Dr Robert G. Heath of Tulane University. Meanwhile, Dr C. Norman Shealy, chief of neurosurgery at the Gundersen Clinic in La Crosse, Wisconsin, has perfected electro-analgesic techniques to the stage where they are now being applied to humans, mainly through the implanting of a point-eight to one-point-two stimulating electrode in the spine, rather than in the brain. Regarding electro-sociology, a team of doctors at Massachusetts General Hospital and Boston General Hospital have pacified violent human subjects by the implantation of electrodes into the rostral part of the caudate nucleus of the brain. It is requested that all these people be placed under immediate surveillance.’

Wilson switched the recorder off and sat back looking thoughtful, then he stood up and crossed the room to place his hand over a control box. The opaque box glowed red and the paneled walls slid apart to reveal a linked audio-visual computer system, a mass of monitor screens and controls. Wilson pressed the MODE button, another button marked VISUAL/RECORD, and a monitor screen, six feet by six, crackled into life. Wilson then turned a directional knob and saw a door, a white wall; he kept turning until he saw the crippled dwarf stretched out on his bed. The dwarf was still fully clothed, a pair of blue denims, a checkered shirt, and he twisted

and turned uncomfortably on the bed, moaning loudly and sweating. His eyes were luminous with fear, his metal claw opening and closing spasmodically, and when he glanced around the room he seemed to shrink from the blank, white-painted walls.

‘Stay still,’ Wilson said, speaking softly. ‘Relax. Just lie quietly.’

The dwarf froze where he lay, his large eyes fixed on the camera, as Wilson turned another knob marked ZOOM to see the dwarf’s face in close-up. The dwarf’s eyes were now filled with hope, beads of sweat shone on his nose, and his tongue crept out tentatively from his lips to lick up the saliva. Wilson studied the screen and smiled, flicked a switch, turned a knob, and the dwarf’s head started jerking, the eyes widening, then closing, until his head seemed to sink into the pillow, the lips shaped in a crooked smile.

Wilson studied the large screen, observed the dwarf in sleep, turned the sound up and heard even breathing, a heart beating now beating normally. He then looked at the ECG, noted the subdued, irregular flickering, and satisfied that the dwarf would sleep well, he turned the monitor off.

Moving away from the console, Wilson crossed the study and went through a doorway, into an adjoining, L-shaped lounge. Covering one wall of this room was an enormous ITT television set, a Neal tape-recorder, a Philips video-recorder, and a bank of expensive Revox hi-fi equipment. Facing this luxurious system, about fifteen feet from it, was a low settee with a bank of switches on one arm. Wilson sat down here, found a list of video programs, studied them and then pressed the switch that was wired to the kitchen. There was a soft humming sound and part of the paneled ceiling descended, dropping down until it covered Wilson’s legs and formed a small table. Resting on the table was a bowl of fruit and nut cereal, with a glass of white wine. Very dry. Very cold.

Wilson pressed another switch marked VIDEO/PLAY/3, then he picked up his spoon and started eating as the TV screen brightened. He watched the

program as he ate, his blue gaze intense, occasionally rubbing his unusually smooth, unlined forehead, concentrating ferociously. It was a pre-recorded tape, a compilation of various programs, a condensed survey of all the scientific and political events that he had missed during his absence. He finished his meal, but kept watching, his brain recording, calculating, and only when the program had ended did he appear to relax. He pressed another button, the table ascended into the ceiling, and then he stood up and languidly stretched himself and went into his bedroom.

This room was like all the others, the lighting subdued, the temperature moderate, a few expressionist paintings on the walls, more control panels flickering. Wilson undressed himself, his body lean but tense with muscle, lengthy scars running across his back and chest, and stepped into the shower. Like all else in this building, the water's temperature was preset; the water also contained an olive-based detergent that negated the need for soap. Wilson stood there for some time, his brain disseminating information, then he stepped out, dried himself with a warmed towel, and then stretched out on the bed.

There were glass panels in the ceiling, hiding a Nordic solarium; when Wilson pressed another button, the glass panels slide apart and the solarium came on automatically, beaming down infrared rays. Wilson lay very still, his eyes covered by protective glasses, breathing deeply, holding his breath for long periods, letting it out only slowly. His tense muscles relaxed, his scarred body seemed to glow, and then, precisely thirty minutes later, the solarium switched itself off.

The girl arrived shortly after, opening the door with some care, looking at him and seeing him nod and padding quietly toward him. She was in her bare feet, her body wrapped in a loose sarong, her jet-black hair trailing down her spine, shining under the soft lights. Wilson remained on the bed, completely naked, looking up at her, his azure gaze revealing no more than a cool curiosity. The girl was slim, very young, probably in her late teens, her brown

eyes and copper-toned skin suggesting a half-caste Eurasian. She stood beside Wilson's bed, her head bowed, her hands clasped, and Wilson remained there, studying her at length, quietly pleased by her beauty.

'What's your name?' he finally said.

'Rita,' the girl whispered.

'You know what I require?'

'Yes, sir.'

'Good. Please proceed.'

The girl loosened her sarong, let it fall to the floor, and stood there, her naked body gleaming, covered lightly with oil. Her legs were long and slim, her waist tiny, her breasts full, the triangle of hair slightly shaved, quite smooth, almost velvety. Wilson looked her up and down, his gaze calm, analytical, then he nodded and the girl smiled with gratitude and sank to her knees.

She leaned over the bed, her hair falling across his loins, then she held his flaccid penis in one hand and slid it into her mouth. He watched her, smiling thinly, feeling her lips, her rolling tongue, her teeth pinching gently, imperceptibly, her mouth wet, a warm glove. Wilson lay there and smiled, a remote smile, half regretful, then he reached out and touched the girl's head, felt it move up and down. Her wet lips, her rolling tongue; he tried to feel her and respond, gazing down at her shining, outspread hair, trying to will himself into her. The girl was expert, well schooled, her mouth working its ways on him, but the distance he had traveled, all the years, again rendered him impotent. The girl eventually raised her head, his flaccid penis in her hand, her brown eyes enlarging, lit by fear, her face begging forgiveness.

'It's all right,' Wilson said quietly. 'It's not your fault. Just use the machine.'

The girl was visibly relieved, standing upright, smiling gratefully, then she

went to the wall beside the bed and pressed an imbedded button. Two paneled doors slid apart, exposing a walk-in cupboard, and the naked girl entered and then emerged with a small, mobile console. Wilson closed his eyes again, heard her movements, felt her hands; she dabbed the paste on his forehead, on his cranium and temples, then she fixed the thin electrodes to his skull and switched on the machine.

An imperceptible current. A flow of energy through his brain. He relaxed, gave himself to the machine and felt his body responding. Opening his eyes, he saw himself: his erect, engorged penis; the naked girl leaning over his penis, tying something around it. He closed his eyes and surrendered, the years falling away from him, voluptuous visions and perverse, buried fantasies rising up to envelop him. Fierce reality and heat; the sublime, unraveled flesh… he saw it and touched it and felt it and returned to his youth. The girl breathed in his face, her tongue slipping between his lips; she moved down him, down his body, her lips and tongue busily working at him, sliding over him, burning him. The visions filled him and released him, engorged his penis and drained it, and then he gasped and slowly opened his eyes and felt the inflowing peace.

The room seemed a lot brighter. The naked girl was very real. He watched her as she soaped his sperm-drenched loins, washed him clean, dried him carefully. When she had finished, she straightened up, her dark, oil-slicked body gleaming, looking at him, at once nervous and questioning, her head bowed automatically. Wilson smiled at her and nodded, indicating that she could leave, so she pushed the console back into the cupboard, closed the doors and left the room.

Wilson put on his dark glasses, pressed a button and then stretched out; the glass panels in the ceiling slid apart to expose the solarium. Wilson lay there for some time, trying to relax, his eyes closed, but eventually his restless intellect forced him upright and made him start work again. He rolled off the bed, put on his dressing gown, then entered the study and sat down and

turned on the tape-recorder. He spoke quietly, precisely, academically.

‘Dr George D. Schroeder of the American Institute of Orgonomy, Seattle, writing in the English magazine, *New Scientist*, has stated that orgone energy weather engineering techniques are an important new element in the environmental struggle. Schroeder has finally received government backing for a lengthy program of investigations into weather engineering possibilities. Already he has discovered that orgone energy exists as a mass-free energy in the soil, water and atmosphere of Earth, and that it is manipulable by mechanical cloud-busters, more commonly called CLBs. It is to be noted that so-called *tuned* CLBs have proved their value not only in weather engineering, but in more than one UFO investigation. This has to be stopped.’

Wilson stopped talking, sat back, stroked his chin, his silvery-grey hair falling over his blue eyes, across that smooth, unlined forehead. He gazed at the opposite wall, at the banked monitors and video-recorders, and his bright, mathematical brain considered all of the options. He had once met Schroeder, had found him tough and intelligent, a possibility that might yet be tapped, a candidate for the future. It was a pity of lose Schroeder, but he didn’t have much choice: the good professor now had government backing and that smacked of progress. Wilson gazed across the room, pursed his lips, stroked his chin, then he sighed and ran his fingers through his hair and spoke quietly, implacably.

‘Eliminate Schroeder.’

CHAPTER THREE

The Audi 100 GL, all white and polished and gleaming, came up over the top of the hill and rolled down through the narrow, gray street in no particular hurry. Richard stepped forward quickly, his thumb high in the air, but the gleaming white Audi purred past, splashing water across him.

‘Oh, shit,’ Richard murmured.

He lowered his thumb and wiped rain from his forehead, glancing up to see the leaden gray sky and the dark, drifting clouds. At least the rain had stopped; there was that, if nothing else. Richard shivered, adjusted his knapsack, checked the camera strap around his neck, then, soaked to the bone, his hair samply plastered to his head, he turned and walked along the village street, past a row of semi-terraced houses.

The road opened out at the end of the village, curving uphill past a seventeenth-century church, dominated by green hills. The Audi had stopped in front of the church, its engine cutting in and out, the car jerking roughly as it misfired and tapered off into silence.

‘Good for you,’ Richard murmured.

He wiped rain from his beard, adjusted the knapsack again, then sauntered in a deliberately casual manner toward the stalled car. An arm emerged from the driver’s window, suntanned, definitely feminine, the fingers fanning out to drop a cigaret in front of Richard’s feet.

‘Jesus!’ the woman softly exclaimed.

Richard stopped immediately, looked down, saw her green eyes, a wave of shining red hair tumbling around pouting lips. The women clenched her right fist and lightly hammered the steering wheel, then licked her upper lip and glanced at Richard, her fine eyebrows raised. Richard smiled encouragingly at her, ran his fingers through his long hair, his blue denims and jacket still wet, the cold creeping into him.

‘Can I help?’ he asked.

The woman studied him for a moment, gently biting her lower lip, then, satisfied that he looked sane, she shrugged her shoulders and nodded.

‘I haven’t a clue what happened,’ she said. ‘It just suddenly cut out.’

Richard shivered and glanced about him, saw the green hills of Devon, then he let the knapsack slide from his shoulders and fall to the ground.

‘It might be nothing,’ he said. ‘A bit of damp. Something jammed. It probably isn’t anything serious. I’ll look under the hood.’

The woman stared thoughtfully at him. Her gaze appeared to be unfocused. She had a thin, suntanned face, sophisticated, rather weary, fine eyebrows arching above the green eyes, lips unpainted and moist.

‘Get it started and I’ll give you a lift,’ she said. ‘Cars quite simply baffle me.’

‘It didn’t cut out gradually?’

‘No,’ the woman said. ‘I saw the lightning and then the engine cut out. Does that make any sense to you?’

Richard glanced at the gray sky. ‘Lightning?’ he said. ‘Are you sure? *I* didn’t see any lightning. I don’t think it was that.’

The woman shrugged again. ‘It *looked* like lightning. Anyway, that’s when the car cut out. I just don’t understand it.’

‘Not lightning,’ Richard said. ‘There was definitely no lightning. You probably saw the lights of a plane. Let me look at the engine.’

The woman shrugged a third time, then leaned across to her left, her hand reaching down to the floor. Richard shivered, feeling cold, hearing the snapping of the lock, then he walked to the front of the car and raised the wide, heavy hood. The engine appeared to be normal. He told the woman to try the ignition. When she did so, the car roared back into life and then ticked over smoothly.

Richard stepped back, surprised. He glanced past the raised hood. The woman was leaning out of the window, the wind blowing her red hair.

‘What did you do?’ she asked.

‘Nothing,’ Richard confessed.

‘You must have done *something*,’ the woman said.

‘I just looked at it,’ Richard said. He threw her a grin, slammed the hood down, then walked back and leaned toward the woman, his gaze fixed on the warning lights on the dashboard.

‘It looks okay,’ he said. ‘The battery light’s out. It must have been something pretty simple and it’s obviously cured itself.’

The woman smiled at him, her green eyes unfocused. ‘You just looked at it and it worked,’ she said. ‘You must be a charmer.’

Richard blushed and grinned shyly. ‘I don’t think so,’ he said. ‘Anyway, it’s working again, so do I get that lift now?’

‘Where are you headed?’

‘St. Ives.’

‘You’ve got it,’ she said. ‘Put your knapsack in the boot. It’s not locked. Let’s go while the going’s good.’

Richard grinned with pleasure, a boyish grin, blue eyes brightening, then he picked up his knapsack, glanced briefly at the nearby church, and walked to the rear of the car, glad that it had stalled. He opened the trunk, heaved the knapsack in, closed the lid and then returned to the woman, looking down at her upturned face. She had lit another cigaret, her lips pouting, blowing smoke, and the green of her eyes was slightly bloodshot, her gaze still unfocused.

‘Okay,’ she said. ‘Get in.’

‘Front or rear?’ Richard asked.

‘I don’t like to talk over my shoulder, so get in beside me.’

Richard walked around the car, opened the door and slipped in, closed the door and sank into his seat, appreciating the luxury. The dashboard was polished wood, the seats a deep maroon velours, and the woman, in her knee-length dark dress, seemed to match it all perfectly. Her red hair was long and lustrous, tumbling down to her shoulders, emphasizing the shifting green of her eyes when she glanced briefly at him. She put her foot on the clutch, the dress tightening, drawing upward, and Richard glimpsed the shadowed outline of her thighs as she turned the ignition on.

‘It’s still working,’ she said.

Richard nodded his agreement, clasped his hands and unclasped them, as the woman pressed down on the accelerator and the car started moving. The sodden, green hills, the dripping trees, the brooding clouds above the

unwinding road… Richard kept his gaze fixed on the scenery, feeling tired and unreal.

The woman drove in a careless manner, averaging fifty miles an hour, her right hand manipulating the steering wheel, her left holding the cigaret, the lips pouting when she exhaled the smoke, her breasts rising and falling. Richard kept glancing sideways, attracted to her, feeling furtive, surprised that he could harbour such notions for a woman so old. Well, not really so old: probably in her late thirties. Nevertheless, she was sexy, her legs long, her breasts firm, and Richard flushed when she suddenly stared at him with her slightly bloodshot, unfocused, cat-like green eyes.

‘What’s your name?’ she asked.

‘Richard… Richard Watson.’

‘A student?’

‘Yes,’ Richard said. ‘I go to the Art College in Hornsey. I want to be a designer.’

‘Hornsey?’

‘London.’

‘Ah, yes,’ the woman said. ‘North London. I’m not keen on that area.’

She drove in silence for another minute, breathing deeply, exhaling smoke, and Richard shifted uneasily in his seat, trying to keep his eyes off her.

‘A designer,’ she said eventually. ‘What kind of designer?’

‘Magazines,’ Richard said. ‘That kind of thing. At least that’s what I’d like to start with.’

The woman looked at him and smiled, blinked her eyes, coughed a little.

Richard glanced down to see her silken legs tapering into the high-heeled shoes.

‘Why are you going to St. Ives?’ she asked.

‘Just a holiday,’ Richard said. ‘A friend of mine owns a holiday cottage and he’s letting me use it.’

The woman smiled again, lips pouting, blowing smoke; the smoke swam in a haze around Richard, making him cough.

‘An art student,’ the woman said.

‘That’s right,’ Richard said.

‘All art students drink,’ the woman said. ‘At least that’s what I’ve heard.’ She put her cigaret in her mouth, inhaled, blew the smoke out, held the steering whee lightly in her free hand, the wet hills whipping past her. ‘Well?’ she asked abruptly.

‘What?’ Richard responded.

‘Is it true that most art students drink?’

‘I wouldn’t know,’ Richard said.

He coughed into his fist, slightly embarrassed by the drift of her conversation, and tried not to look at the breasts thrusting out from her tight dress. The woman was obviously well off, a bit jaded, worldly wise, but her strange, oblique statements filled him with a sense of foreboding. Thinking that she might be drunk, he glanced at her bloodshot eyes. Though she looked drawn and certainly tired, he still thought her sexy.

Richard shifted uneasily. A guilty flush burned his cheeks. He thought of Jenny back in London, of the two weeks ahead of him, and he silently cursed

his primitive lust and wondered how men survived it.

‘Do *you* drink?’ the woman asked.

‘When I can afford it,’ Richard said.

‘Good,’ the woman said. ‘I’d rather not drink alone. You’ll find a flask of gin in the glove compartment. I think we should share it. Shake off the cold at least.’

Richard turned his head slightly, glanced at her, saw her eyes, twin pools of green flecked with red, and was convinced of her drunkenness. He turned away just as quickly, desiring her, feeling foolish, pulled the lid of the glove compartment down and found two hip flasks, one on top of the other.

‘The bottom flask,’ the woman said. ‘The one on top is empty. I get tired when I drive.’

Taking note of that odd remark, Richard removed the top flask, withdrew the one beneath it, unscrewed the cap and held the flask out to the women. She shook her head from side to side, her red hair like a flame.

‘You first,’ she said quietly.

Richard shrugged and drank some gin, felt it burning down inside him, warming him, making his head swim, alleviating his weariness. He wiped his lips and burped a little, passed the flask to the woman; she stubbed her cigaret out, took the flask, her other hand still on the steering wheel. Richard watched her drinking. The shining red hair framed her face. When she finished, she gave the flask back to him and placed her free hand on the steering wheel.

‘Have another,’ she said.

They both drank too quickly, passing the flask back and forth. The A30 ran

past Dartmoor, through Featherford and Fowley, stretched ahead through the sodden hills and fields, climbing languidly and rolling downhill again. They saw little of all this, both involved in their drinking, time dissolving as the drink took command and made them feel even more unreal. Richard studied the woman. He thought of Jenny back in London. This thought, with its residue of guilt, crossed his mind and then passed on.

‘You didn’t see the lightning,’ the woman said obliquely. ‘I just don’t understand that.’

Richard reached into his pocket, withdrew a cigaret, lit it and then glanced at the woman, wondering what she was talking about. The woman returned his gaze, her green eyes bloodshot and unfocused, while the car, offering a smooth, rhythmic humming, rolled on through the desolate countryside.

‘Where are you going?’ Richard asked.

‘To Bodmin,’ the woman said. ‘I live in St. Nicholas. It’s a very small place, very quiet… Without London, I’d die.’

Richard didn’t reply. The woman seemed even more distracted. Richard scratched his forehead and glanced out the window and noted that the drifting clouds were thinning. A pearly gray haze broke through, striations of weak light beaming down, fanning out, fanning over the wet fields and the stark, Neolithic remains.

‘What time is it?’ the woman asked.

Richard checked his wristwatch. ‘Ten to six,’ he said. ‘Around that… give or take a few minutes.’

‘You didn’t see it,’ the woman said.

‘The lightning?’

‘The light. It was obviously some kind of bright light. I keep thinking about it.’

Richard shivered, feeling cold again. ‘There was no lightning,’ he insisted. ‘No thunder, no lightning – just the rain. You must have seen an airplane.’

‘With lights?’

‘With lights.’

‘In the daylight?’

‘That’s right.’ Richard drank some more gin and passed the flask to the woman. He saw the scepticism in her eyes and looked back at the onrushing road. ‘Okay,’ he said. ‘So you saw a bright light. You saw a flash – a plane reflecting the sunlight. I think that’s what it was.’

He sighed – too loudly. The woman’s gaze turned toward him. She shrugged and put the flask to her lips while driving dangerously fast.

‘No,’ she said. ‘It was too quick for that. It just appeared in a flash and then disappeared.’

Richard shook his head wearily, feeling drunk, slightly disturbed, staring out at the cold, descending evening, at the vast, bloody sky. The sun was sinking beyond the moors, a fiery orb, large and luminous, melting slowly, spreading out along the low hills in two streams of pulsating flame.

‘Not possible,’ Richard murmured. ‘Just not possible. You must have imagined it.’

The woman didn’t reply. Her red hair reached her breasts. The car hummed and vibrated, an abstract, seductive rhythm, the bleak hills of the moors rolling past, the road unwinding in front of them. Richard looked and was held, saw the marshlands and quarries, the Neolithic stones silhouetted in that

fierce, bloody sky. It was the landscape of a dream, serenely beautiful, yet ominous, and it made Richard shiver and lower his gaze, wondering why it disturbed him.

‘I think I’m drunk,’ he murmured.

‘Already?’

‘Yes.’

‘You must have been tired,’ the woman said. ‘Lie back… Try to sleep.’

Richard stubbed his cigaret out, put his head back on the seat, closed his eyes and felt the drowsiness creep over him, almost embalming him. His thoughts scattered and spun, became streaming stars, dark shapes, the past and present in one, as a shifting kaleidoscope: the cluttered rooms of the art college, a nude model in a chair, Jenny’s brown eyes, the woman’s flaming hair, the swirling mist over shadowed hills. He fell in and out of sleep, felt a langorous desire, saw the tight dress on the woman’s shapely thighs, Jenny’s steady, accusing gaze. Guilt and lust made him restless. His eyes fluttered and opened. He felt the woman’s fingers at his elbow, tugging sharply, incessantly.

‘There it is!’ she said. ‘*Look*!’

Richard shook himself awake. The car vibrated beneath him. He glanced briefly at the woman, saw her green eyes, the red hair, glimpsed the pink bud of her tongue between her teeth and then looked at the sky. The sun was sinking in the west, a crimson orb above the hills, the sky a molten stream of red and blue, the clouds drifting away from him. Richard looked all around him. He saw nothing unusual. He looked back at the woman, saw her bloodshot, glinting eyes, and wondered just how much she had drank before picking him up.

‘There’s *what*?’ he said.

The woman whispered something, shook her head and smacked the steering wheel. ‘Damn it,’ she said, ‘it was there. I just saw it! *That light*!’

Richard rolled his eyes mockingly. ‘The lightning?’ he said.

‘No!’ she snapped. ‘Not lightning. Something else. A streak of light. It just passed us.’

‘Passed us?’

‘It crossed our path. It flew east to west. A long streak of light. Like a tadpole. I just blinked and it disappeared.’

‘A meteor,’ Richard suggested.

‘You think so?’

‘I think so.’

‘Maybe you’re right,’ the woman said. ‘I don’t know… It seemed strange.’

She shook her head from side to side, her eyes brighter, less bloodshot, flitting from left to right in nervous spasms, surveying the twilight sky. Richard stared at her, disturbed, wondering if she was hallucinating, now aware that she had really drank a lot and was dangerously tired. Then he looked up at the sky. He did it almost against his will. He saw drifting gray clouds, the crimson fire of the sinking sun, vaporous ribbons of mist along the hills, the lonely splendour of Bodmin Moor.

‘We’re in Cornwall,’ he said.

‘You’re a bright boy,’ the woman said. ‘We’ve been in Cornwall for the past thirty minutes and you’ve finally noticed.’

Richard flushed at her sarcasm. ‘I’m pretty sleepy,’ he said. ‘I’m tired and the gin just knocked me out. I can hardly keep my eyes open.’

The woman appeared not to have heard him. She kept looking all around her. Her green eyes were too bright, framed by flaming red hair, and she kept licking nervously at her upper lip, her tanned brow furrowed anxiously. Her tension was contagious, reaching out to touch Richard; he glanced around and saw the moors, the hills rushing past the car, rising and falling away into shadow, looking ancient and frightening. Richard shivered again. He suddenly felt oddly haunted. He stared obliquely at the sun, at that sinking ball of fire, and the light spread out and filled his line of vision and made his eyes sparkle.

‘Why strange?’ he asked.

‘Pardon?’

‘You said that the light you saw seemed strange. What did you mean by that?’

The woman’s eyes turned toward him, too bright, no longer bloodshot, took him in and then turned back to the road and blinked repeatedly, nervously.

‘I don’t know,’ she said.

‘Think,’ Richard said. ‘Let’s assume it wasn’t a meteor or a plane. What do you *think* you saw?’

The woman took a deep breath, nervously licked her upper lip, then raised her left hand, spread her fingers and patted her hair.

‘It was very fast,’ she said. ‘It was very close the first time. The first time I just saw a bright flash and I assumed it was lightning. The next time it was different: it was farther away. It was fast – a lot faster than a plane – and it seemed unnaturally bright. It flew from east to west. It shot across and disappeared. And it didn’t really fly out of sight: it just seemed to blink out. It wasn’t a plane. I know it couldn’t have been a plane. It was strange. It wasn’t

a meteor. It appeared to be… *climbing*.'

Richard felt ill. His head was light and he felt feverish. He wiped his lips with the back of his hand, glancing vaguely around him.

'*Climbing*?' he said.

'You're always repeating what I say.'

'It was faster than a plane and it was climbing? Are you sure you saw right?'

'I'm not *that* drunk,' the woman said. 'I think I know what I saw. That light was very bright, very fast, and the damned thing was… *ascending*.'

'Any noise?' Richard asked.

'Not a sound,' the woman said. 'It just shot across the sky, in front of the car, and then it blinked out… making no sound at all.'

Richard glanced around him, saw the desolate, timeless moors, sludge-like clouds drifting over the misty hills, the sky a darkening crimson haze. There was nothing up there. The woman was probably hallucinating. She was obviously very tired, she'd had too much to drink, and now she was starting to fall apart and see things that weren't there.

This thought disturbed Richard. He wanted to get out of the car. He didn't want to end up in a ditch with his head through the windscreen. Hoping to avoid the subject, he closed his eyes and tried to sleep. He slipped in and out of consciousness, his head spinning, stomach churning; he thought of Jenny back in London, of the cottage in St. Ives, of the woman's red hair and green eyes, her tongue licking her upper lip. These visions were relentless, materializing and disappearing, giving way to streaming stars and spinning suns, to white lights in a black void. Richard shivered and muttered incoherently. A bolt of panic lanced through him. He almost groaned aloud, but checked himself, shook his head and licked his dry lips, then spiraled

back up through the darkness and opened his eyes again.

‘What on earth…?’

The woman glanced at him, shook her head in bewilderment, pressed her foot on the accelerator and changed gears as the car coughed and spluttered. The engine roared and then cut out. The woman cursed and pumped the pedal. The engine spluttered again and then was silent as the car rolled downhill. The woman turned the ignition key, changed gears, but nothing happened. The car rolled down the hill, its wheels hissing in the silence, then it stopped where the road leveled out and its headlights blinked off.

‘I don’t believe this. *What’s wrong*?’

The woman shook her head and angrily smacked the steering wheel. She turned the ignition key a few more times and still nothing happened. Cursing, she looked at Richard. He shrugged and stared outside. He saw the blood-red sky, the gnarled, silhouetted trees, a nearby circle of Neolithic stones that made him think of other worlds. Richard felt himself shivering. The silence seemed to be vibrating. He gulped and licked his lips, his heart racing inexplicably, then he turned and stared hard at the woman and imagined a roaring.

Not a roaring… Something else… A strange, nerve-tingling humming. Richard blinked and saw that huge pulsating sun, the light shifting, expanding. ‘Oh, my God!’ Richard whispered. He abruptly forgot what he was doing. The sun expanded and became a white sheet that blotted out the whole sky. Richard gasped and knew fear. He pushed the woman against her door. He saw her hands darting up to cover her ears, the sky beyond her a silvery haze.

‘*Jesus Christ*!’ Richard hissed.

It came over the nearest hill, over the Neolithic stones, a fierce, incorporeal

luminescence that spread out and moved forward. Richard stared and was blinded, turned away and looked again, heard a loud, almost physical humming, felt the sound, was crushed by it. The woman shrieked and shook her head, her hair falling around her face, bent forward, huddled up, her head touching her knees, trying to hide in her seat. The noise increased and the light expanded, swept across them, filled the car, and Richard gasped and felt a sudden scorching heat that made him howl and double over, just like the woman.

His head touched the woman's head. The whole car started shaking. The engine roared into life and then cut out again and left only the sound of the woman's sobbing. Richard retched. He felt the burning of his face. He touched the woman and felt her jerk away as if stung by a whip. The vibration, the noise… Oh, my God, it was cutting through him… His body trembled as his mind slipped into chaos, an intense, choking fear… What was it? Jesus Christ! Something roared and shook the car. He glanced up and saw the woman's red hair, the blinding white light beyond her. Richard felt his heart pounding. Sweat was pouring down his face. The car rocked from side to side, shrieked in protest, and then settled down again. Leaving silence… and fear.

Richard shivered and shook, reached out slowly, touched the woman; she recoiled and stared at him with wide eyes, still crouched low on the seat. They just stared at one another. Neither knew what to say. The interior of the car was unnaturally bright and then it abruptly darkened. Richard wiped sweat from his forehead, licked his lips, gasped for air, his chest heaving, lungs scorched and sucked dry, arms and legs shaking helplessly. The woman's green eyes were glazed, looking at him and through him; and then, as if by order, as if reading each other's thoughts, they both sat up and turned to the front and looked out at that brilliant white haze.

'*Oh, my God*!'

'*Jesus Christ*!'

The fear crawled up Richard's spine, took a hold, shook him viciously, left him limp and drained, a hollow shell, almost mindless with disbelief. The woman clearly felt the same, body twitching, dress soaked, her hands rising blindly to her face, fingers outspread and trembling. They both sat there in the car, looking out, their eyes stinging, taking in the impossible dream, their senses deserting them.

The white haze was receding. Beyond the white haze: a dark mass. The dark mass, that great featureless body, was blocking off the whole sky. Richard stared and was mesmerized, terrified and fascinated, looking out across that field of shimmering light to where it eclipsed the sinking sun. He couldn't believe in that dark mass. He kept looking and it remained. The white haze seemed to flare up and fade slightly, and then he saw the dark mass more clearly.

It was hovering above the ground, about a hundred feet up, an enormous dark mass, a dark mass containing lights, sequential flashes of green, blue and orange, very bright, very fast. The lights went from left to right, illuminating the ground below. Richard gasped when he saw an immense, silvery disk stretching over the whole field. It was several stories tall, about three hundred feet in diameter, an enormous, kaleidoscopic apparition that rendered him speechless.

Fear and fascination. Disbelief and stunned awareness. Richard felt his thoughts slipping and sliding into dark, swirling chaos. Was he drunk? Hallucinating? The woman's red hair: Was she real? He gasped for air and tried to stop himself from shaking, tried to keep himself sane. The woman trembled beside him, her hair falling upon her shoulders; her spine was arched and she seemed to shake in spasms and then settle down again. Richard looked past her head, saw that huge, floating mass, its colored lights flashing on and off brilliantly, illuminating the field below.

Richard sobbed and bit his lip. He looked again and saw it changing. It flared up and went dark, became one with the evening sky, then two panels of

yellow light, a good three hundred feet apart, materialized to silhouette two black pupils, two bright eyes staring down at him. The woman gasped and bit her knuckles. Richard held on to his seat. The shimmering panels disappeared, the black pupils became metallic, then they flew down from that vast ink-colored mass and headed straight for the car.

‘*Jesus, no!*’ Richard whispered.

A whipping sound: the car shook. A brief silence: a sudden humming. Richard closed his eyes and opened them again and saw the disks at both sides of the car. They were miniature flying saucers, about three feet in diameter, and they circled the car slowly, first humming, then whistling softly, and then a beam of light shone from each one, cutting down through the darkness.

The car began to shake. Richard groaned and clenched his fists. He glanced at the woman, saw her sitting up straight, and understood, rather than saw, her paralyzed fascination. Richard couldn’t believe it; he sensed no fear in her at all. Then a disk dropped by her window, shone a bright light on her face, and she gasped, visibly twitched, settled down, closed her eyes and just sat there. Richard sank into his seat. The blade of light burned his neck. It moved away and he sat up again and saw the disks disappearing.

‘It’s all right,’ the woman whispered, opening her eyes, looking peculiar. ‘Don’t be frightened. It’s all right.’

Richard stared at her and shivered, disbelieving, wracked by fear, his breath coming in large, anguished gulps, his heart pounding, his head on fire. Against his will, he looked up. The panels of light blazed in the sky. He saw the immense, much darker mass above the field, the panels of light at each end of it. Then the panels swallowed the disks, blinked out, leaving darkness; then the black mass, that enormous floating shape, started glowing and flashing.

Mesmerized, Richard watched it.

The great disk was solid, a silvery craft in a shimmering white haze, towering high and spread out across the field, flashing green, blue and orange lights. It now had shape and dimension. It had long, narrow windows. Silhouettes moved back and forth across the windows, very small, faraway. The colored lights continued flashing, illuminating the field below; the tall grass and shrubs had been flattened and appeared to be scorched. Richard looked up in awe. He saw the panels at either end. They were doors and they opened again, looking larger, more ominous. Then Richard shook with fear. He reached out to touch the woman. He saw another two disks, silvery-gray, emerging from the panels. There were searchlights on these disks, turning down toward the car. The disks hovered just in front of the larger craft, then flew toward Richard.

'*Oh, God*!' he whispered, distraught, feeling unreal, disorientated, stripped of every defence; he sat trembling in his seat, feeling naked, dispossessed from the real world. What was happening? Was this real? Where was he? *Hallucinating*! He tried to think about who he was, what he was, but then it all fell away from him. A whipping sound, a sudden wind, the car shaking and shrieking, then silence, the other disks at each side of him, their gray metal gleaming.

Richard almost stopped breathing. He couldn't believe what he was seeing. He reached out and grabbed the woman by the shoulder and she turned and stared at him. He saw her suntanned face, the red hair, the moist lips; her green eyes were staring at him and through him as if he didn't exist. Richard shivered and turned away. He saw a disk outside the car. It was about thirty-five feet wide, hovering just above the ground, and its perimeter swept up to form a dome made of something like frosted glass. Richard stared, mesmerized. A strange creature stared back. The opaque dome distorted its features, made it look quite grotesque. The eyes were two slits, the nose appeared to be metallic, and Richard shivered with revulsion when he

realised that it didn’t have lips. The creature’s skin was gray and wrinkled. It raised a clawlike hand. Richard screamed and then a beam of light struck him and rendered him oblivious.

Darkness. Streaming light. A sudden nausea and dread. Richard retched and shook his head and sat up and hardly noticed the woman. No point looking: she was frozen. Richard stared straight ahead. He blinked and began to scream and then stopped himself and just shrank in his terror.

He was still in the car. The fallen night stretched around him. The mother ship, that enormous craft, was coming down and blocking out the whole view. It seemed incredible, almost magical – its very silence made it awesome. It was spread across the field straight ahead, its colored lights flashing on and off. Richard licked his lips and groaned, rubbed his eyes and shook his head. The enormous craft settled down above the ground, fifty yards from the car.

Then the car started moving. It also went wild. Richard’s camera-strap snapped, the camera smashed against the dashboard, then his ballpoint pen shot out of his pocket and fixed itself to the windscreen. Richard couldn’t believe it. The air was sucked from his lungs. The woman’s bracelets suddenly shot off her wrists and also stuck to the windscreen. Richard gasped, trying to breathe. He was being drawn forward. He pressed his hands against the dashboard and pushed himself back, but had to hold himself there with great effort. The car continued moving forward. Richard couldn’t trust his senses. The car was silent, but it moved forward inexorably toward that immense, flashing mass. Richard tried to scream again; he opened his mouth but nothing happened. He glanced at the woman, saw blind eyes, and then he looked at the smaller disks. They were at both sides of the car, hovering just above it, each shooting a beam of light down upon it, drawing it forward with them. Magnetism? *Oh, my God*! That’s impossible. *Jesus Christ*! Richard pressed himself back into his seat and looked ahead and was terrified.

The enormous craft was there before him. It filled all of his vision. The

colored lights flashed on and off, left to right, right to left, then they abruptly blinked off, leaving gray metal gleaming, then the metal appeared to split along the bottom and a long, thing white light emerged.

Richard sobbed and shook. His eyes were wide and disbelieving. He saw a large metal door sliding upward, then his senses were shattered. A dazzling white light all around him. Silhouettes in the haze. The car was picked up and drawn toward the light and then surrounded on all sides. Richard drained out of himself. He let his senses fly away. He opened his mouth to scream but nothing happened, so he simply collapsed.

All white.

Everything.

CHAPTER FOUR

It is important that I remember. My time will soon be up. The plastic surgery and the pacemaker and the prosthetics have all been useful, but the liver still manages to elude us and so I must die. I remain philosophical. I have had more than most. I have lived a long time, made the dream a reality, and I cannot complain because nature still hides its secrets.

We never conquered the liver. Perhaps we never will. Now I start to degenerate, feel the hardening of my veins, and my memory is not what it was and too often betrays me. No matter: it is done. We cannot be stopped now. The sun glitters off the ice as I write – and the ice is the New World.

It is important to remember. Some fragments, if nothing else. It was all so long ago, so far away, and now it seems like a dream. My parents: not important. We are blessed and cursed by birth. Two very ordinary people heading nowhere, myself growing under them.

I detested my childhood. This much I do remember. Long days in the Midwest, clouds of dust over the flatlands, my father and mother in the fields, bending over their crops. They were simple, decent people. I can scarcely recall them. They talked little and they worked very hard and received scant reward. Detested it. Yes. The days stretched out forever. As a boy, still a child, how young I don't remember, I spent hours gazing up at the stars and wondering how I could reach them.

I've never understood emotions. An aberration of the weak. I am thinking of what they call 'love' and its attendant illusions. They would call me a genius.

By their terms they might be right. From the beginning (I remember this well) I was always obsessed. An emotion of a different sort. Not a need for human warmth. I saw humans in biological terms and thought the world a laboratory. The obsession was with knowing. It was all within the mind. Anything outside the mind – the need for love or material gain – was no more than a degrading manifestation of our primitive origins. What matters in Man is mind. I have always believed that. Even then, as a child, about ten years old I think, I believed that (or felt it) and lived it and would not let it go.

They would call me a genius. I would say 'integrated'. My mind and emotions were fused to perform in calm harmony. No weakness. No digressions. My flesh never defeated me. Even later, as a young man, in the offensive throes of puberty, I would hold my yellow semen in my hand and try to sniff out its properties. The vas deferens and the seminal vesicles, the bulbo-urethral and prostate glands: my ejaculations were examined biologically and found to be normal. I thus conquered such distractions. I took the semen on my tongue. Various liquids and sperm, two hundred million spermatozoa; orgasm thus became a form of research and lost its great mystery.

Hard to believe it now. All so very long ago. My parents ignorant with a Bible on the table, my head in the stars. The small farm was a prison. My decent parents were viewed as wardens. A teenager, isolated, my head bursting at the seams, the lack of books, or the means of education, drove me close to insane. I knew I was exceptional. I felt trapped by circumstances. Two or three times I ran away from home, but I was always brought back. So, I detested it. I just had to get away. This much I remember about my childhood: I grew up in Iowa.

Such a long time ago. The late 1800s. I remained a prisoner by lieu of my background and suffered accordingly. A genius, by their terms. Had to be, even then. For my birthday, I received a microscope and then examined my own sperm. Fourteen? Fifteen? I can't remember my age. In my room, I took my penis in my hand and let the semen stain slides. The mystery of life was in

biology. Ejaculation was mere phenomena. I thus reduced my shifting yearnings and dreams to their most basic nature. The human body was just a vessel. Without the mind it was superfluous. I learned early, and had no cause to doubt, that the mind took precedence.

Science. That is all. The pursuit of knowledge was all that mattered. Even then, growing up in Iowa, I had no other yearnings. The death of my mother pleased me. There was nothing personal in it. A good woman, she died as people do, and that gave me release. My father sold the farm. He took a job in Massachusetts. A small town, I don't recall the name, quite close to Worcester. Thus was I set free. Universities and libraries. My mind was filled with energy and light and I crammed it with knowledge. The Worcester Polytechnic Institute. I wonder what they called it then. I remember that I came alive there and realized my potential.

What year? Does it matter? I think 1888. Then the Massachusetts Institute of Technology and the thrill of logical thinking. I was an outstanding student. I was not very popular. The thrill was in logic, but the nightmare was in people: my genius isolated me completely from the other students.

I don't remember caring much. I don't believe I cared at all. (Goddard would later suffer the same, and he, too, was a genius.) The behaviour of fluids at MIT. Wind pressure on surfaces. The dream of flight was what kept me alive and made the world seem more bearable. I rarely socialized. I only stopped for food and sleep. The dream of flight was my dream, aerodynamics my taskmaster, and my genius drove me forward relentlessly and would not let me rest.

Inhuman? I wonder. I have often thought about it. Not then, but later, when I succeeded, when the skies shed their secrets. Yes, only then. I certainly thought about it then. Repulsed by abstract emotions, by the human need for self-esteem, by what was known as love and affection, I lived without women.

I think I tried once. There are vague recollections. Not inhuman, I must have

been concerned that they would see I was different. A girl with auburn hair. Perhaps a redhead or a blonde. Spreadeagled, her flesh as white as snow, her soft words unbearable. I tried, but I failed. I saw her body as meat. The act of love was as primitive and functional as eating and shitting. I do not recall passion. My rhythmic thrusting was demeaning. My partners' groanings drove me back into myself and made me think scientifically. I studied my probing penis. The parting vulva held no charms. Her heaving body and my downward thrusting loins lacked aesthetic refinement. The caves are just behind us: this one thought I remember. Perhaps I thought of the spermatozoa in the womb and wondered how to control them. Such much for the act of love. My mind would not let me succumb. I gave up and returned to masturbation of a functional kind. This act was not for pleasure. The point was to kill the need. And my hand, which stroked my flesh without guilt, was just a means to an end.

As for love: a mere illusion. Love is nature's slyest trick. The emotion called love is but a tool in nature's great building plan. Love encourages procreation. It protects the helpless young. Its true purpose is not to exalt us but to make us continue. Thus did I view it. I reduced it to biology. Love was no more than the semen in my hand, but it could be destructive. Men lived their lives for love. This made them weaker men. The need for love and admiration (for self-effacement and inner power) was the need that made them abuse their full potential and remain close to primitive.

The possibility was intolerable. I never wanted to let it happen. My genius, the ruthless brilliance of my mind, would not let me accept it. Thus I lived for my studies. I never let my flesh defeat me. My sexual needs were appeased by my own hands or by whores; my body's hungers were not confused with love and could not then distract me. No, I wasn't popular. The other students thought me strange. I think now of that time, of the bliss of isolation, and realize that my devotion to my mind made me someone unique.

My fondest memories are not of people. My fiercest pleasures all came from

facts. Angles of wind attack, lift, drag and airspeed: the experiments with the wind tunnel in the basement of Eng A, the revelations of the vane anemometer, the Lawrence Hargraves experimental reports, Sir Hiram Maxim and his engines and propellers, my mind glowing, expanding. The dream took root then. I wanted the conquest of all knowledge. I had a dream of a society devoid of conflict and dissension, a society subordinated to science and its ultimate truths. I had that dream and lived it. I devoted my whole life to it. And now, looking out at the glittering ice caps, I feel deep contentment.

I never accepted the impossible. I refused to recognize it. I learned with a speed that was thought to be abnormal, living only for the lectures, for the libraries and wind tunnel, my hands black with oil, my eyes red from too much reading, breaking down and analyzing my teachers' words, then racing ahead of them.

My father died in that time. I can't remember the funeral. A kind man, he had lived an aimless life and the lesson was clear to me. Nothing mattered but the mind. Common emotions were mere distractions. What mattered was the grandeur of science and where it might lead us. And so I continued studying. My intellect left me no choice. Then Sibley College, Cornell University, in Ithaca, New York.

All things were possible there. More than most of the students knew. I do not remember faces, but I do remember names: Rolla Clinton Carpenter, Octave Chanute, Oliver Shantz and Aldred Henry Eldridge and quite a few others. Machine design and construction, experimental engineering, electrical and mechanical engineering and aerodynamics. These courses were in their infancy, were the products of the New Age. It was an age of scientific innovation and grand aspirations. A Bachelor of Science in Aerodynamics. I remember that from Sibley College. I believe I gained it in 1895, but I cannot be sure of that.

How stupid people are. How stupid they always were. The only emotion I can

still entertain is that of contempt. For what they did to me. For what they later did to Goddard. They tried to use us and cast us aside and then control our creations. I think of the businessmen. I also think of politicians. Commerce walks hand in hand with politics, and both are corrupt. Man's purpose is to build upon his past and thus conquer the unknown. All other aspirations are pointless: they are only of the moment. This is the dream of science. It is logic, not emotion. It is a logic that is not shared by businessmen or politicians – nor by the mass of normal men who mostly live without purpose. Such men have no real logic. They are moved by base hungers. They are blinkered and retain a narrow view that will never be broadened. They think only of the present. Their future is here and now. They take genius and fear it and use it and then cast it out. I did not know this soon enough.

Within the ice is the New World. Beyond it is the old. I look beyond the glinting plateaus and think of where I came from.

What an age it was then! So magnificent, so blind. An age of flowering genius, of corrupt commerce and politics, an age of the most insoluble contradictions, of builders and wreckers. I did not know soon enough. They financed me and used me. They took my enthusiasm and brilliance and then tried to pervert it. Yet what if I had known? Out of college, a BS in Aerodynamics, I had to take whatever they offered me.

Finance. Equipment. The world opened up to me. The secret hangars in the wilds of Illinois formed my bridge to the future. Myself and some others. The very cream of young scientists. Sworn to secrecy, we worked night and day to make miracles commonplace. We tolerated the businessmen. We rarely thought of the politicians. With the innocence of all passionate dreamers, we just worked for our pleasure. What year was that? Probably 1895. A full year before Langley's first successful test flights, we had already surpassed the airships and were moving toward greater things.

The work never ceased. The secrecy was total. More hangars in Iowa, in the

Gulf of Mexico, yet another in a place near Fort Worth, all producing components. My first lesson in secrecy: a wide spreading of the work force. Who would know in Iowa or New Mexico or Fort Worth what the individual parts they were making would ultimately form? Thus we moved forward. Thus did I create them. The skies opened up and gave me their secrets and the dream became real.

The second lesson in secrecy: that men will not believe their eyes. Or that men, if they do believe their eyes, will be ridiculed for it. We flew right across the country. The huge winds and rotors glinted. They were very primitive flying machines, but they must have looked awesome. And so we could land. Our crude flying craft needed water. And like all young men who feel that they are conquerors, our mood was ebullient. We played jokes on those who saw us, told the truth and then told lies, and later, when we read the newspapers, we knew the ruse had succeeded.

Such a secret cannot be kept. Nevertheless, it can be protected. To protect a secret you must give away part of it and turn it into a rumor. Who mixed half-truths with lies. Speculation did the rest. Who believes what they now see in the skies and can say so with ease? The world's governments understand this. It is a tactic they learned from me. We flew across the length and breadth of America and were never discovered.

All else was superfluous. It was fodder for the masses. Langley's flying machines, the Wright brothers' manned flight, the later flights of Wilbur Smith and Louis Blériot – all were highly publicized trifles. Such events were mere distractions. The real progress was made in secret. By 1904 we had crossed the Pacific Ocean, and our lights, which were seen by the US Navy, were called natural phenomena. Such descriptions were reassuring. I had no desire for glory. My one wish was to continue my life's work without interruptions.

How stupid they are. How stupid they always were. Now they see us in the skies and close their eyes and still refuse to believe it. That's why we are

winning. That's why we could never lose. They could never accept what is possible – but for us, all things are.

CHAPTER FIVE

Epstein stood like a ghost before the open door, hesitant, his heart beating uncomfortably, feeling nervous and childish. He was nervous because the door was open, because the house was in darkness, because Irving Jacob's death and his own failing health had reminded him of life's callous betrayals, its indiscriminate brutality. Now, in the darkness, in the silence of Camelback Hill, preparing to step inside and loathing the thought of doing so, he trembled with a youngster's baseless fear and was ashamed of himself… Irving's death and Mary's grief; his own mortality and passing time; he grew old and his childhood returned with all its haunting uncertainties… Had Irving committed suicide? Or had he been murdered? Why was Mary's front door wide open? Dr Epstein, stoop-shouldered and disconsolate, felt close to ridiculous.

Too melodramatic for a scientist. Perhaps the chief of police had been right. Epstein stood on the porch and looked up to see the sweeping night sky. The stars glittered above the clouds, the latter wispy and sullen, drifting languidly, serene and mysterious, the black sky over all. It was quiet up there. Empty. Epstein shivered and lowered his gaze. He saw his own shadow trailing out from his feet, his unreal other half. We are not what we appear to be, he thought. We live and die in ignorance. He felt deep grief, an aching loss, then he knocked on the open door.

'Mary? Are you in there?'

There was no response. The darkness led into silence. Epstein shivered and then stepped inside, wondering what he would find there. The hallway led

past closed doors, through the kitchen, into the living room; he saw the back of Mary's head above the back of a chair, the chair facing a garden. Mary's head was very still, her black hair turning gray, and Epstein stood there, transfixed, seeing moonlight in the garden, and then coughed and whispered Mary's name, the pain twisting inside him.

'Frederick?'

'Yes.'

'I thought you would come.'

'Is that why you left the door open?'

'Yes.'

'That was dangerous.'

Mary chuckled sardonically, still seated in the chair, facing the moonlight that fell on the garden beyond the glass doors. Perhaps it was the grief, a release from her shock; nevertheless, the chuckle cut through the silence and made Epstein wince. He had come here prepared for tears, for hysteria or rage, but now, in the presence of that ghostly chuckling, he felt only bewilderment.

'Dangerous?' Mary said bitterly. 'You think an open door is dangerous? Irving kept the doors closed all the time – but then he went for a drive. What's a closed door these days?'

The moonlight stretched out to the chair, glinting off her gray-black hair, the back of the chair bisecting her neck, the space around her in darkness. Epstein coughed into his fist, feeling slightly absurd, then he nodded, a silent gesture of agreement, and sighed and sat down just behind her.

'You saw him?'

‘Yes, I saw him.’ Epstein sniffed and rubbed his short beard. He was staring at the back of Mary’s head, at the dark, silent room. ‘He’s been brought into Phoenix.’

Mary leaned forward and sobbed, covering her face with her hands, bent over in the chair, in the moonlight, trying to choke back her weeping. Epstein watched her, feeling helpless, filled with grief and despair, recalling better days, her smiling face, before the work became dangerous.

‘*Please*, Mary,’ he said.

‘It’s all right, I’m all right.’ She straightened up and wiped her face with one hand. ‘Oh, my God, what a day it’s been.’

‘If I can do anything… *Anything*.’

‘You can’t do anything. He’s dead.’

‘I just thought…’

‘There’s nothing to think. He’s dead. It’s all over. Finished.’

She was sitting up straight again, staring into the moonlit garden, a clenched fist shoved into her mouth, knuckles tapping her teeth. Then she sighed and stood up, went to the windows and walked back, turned her chair around and shook her head sadly and sat down facing Epstein. The moonlight formed a halo above her. Epstein saw her tear-washed eyes. She was in her middle forties but her face retained its beauty, an elegant mask now ravaged by loss, the eyes brown and large. Epstein sat there before her, feeling defeated, his love for her and Irving boiling up and turning rancid with guilt.

‘Here in Phoenix,’ Mary said softly.

‘Yes,’ Epstein said. ‘The autopsy.’

‘And presumably they’ll call me tomorrow?’

‘Yes… The arrangements.’

Mary nodded and sighed, her gaze roaming around the room, her white hands twitching restlessly in her lap, trying to hold on to something.

‘Why did you come here?’ she asked.

‘You knew I’d come, Mary.’

‘To offer your condolences?’

‘Yes.’

‘And to ask me some questions.’

It was a mean, honest statement, making Epstein recoil within, flushing, the guilt rushing through him as he stared at her grim face.

‘Yes,’ he said. ‘I can’t help that.’

Mary nodded, smiling bitterly. ‘You just never give up,’ she said. ‘*All* of you. You just can’t give up, no matter what happens. I suppose I should accept it – the good wife supporting the cause – but I can’t. And now Irving is dead. So to hell with your institute.’

‘I have to know, Mary.’

‘You have to know what? That my husband was driven mad by his work and now he’s found peace at last? There’s your answer. Go home with it.’

‘No,’ Epstein said. ‘I don’t think that’s the answer.’

‘Yes, it is. It’s the only answer available.’

‘I don’t think it was suicide?’ Epstein said. ‘I feel I should tell you that.’

The anger was quick to come, flashing out of her brown eyes, her head shaking from side to side in denial as she rose to her feet. She looked down at him, this old man, this professor who felt his age, and her lips, a tight line below the pert nose, spat out all her grief.

‘Damn you!’ she snapped. ‘Damn you and your pride! It’s not that you don’t believe it – it’s that you *can’t*… because you need your obsession. Irving committed suicide. Your work drove him half crazy. He couldn’t sleep, he couldn’t eat, he started ignoring his whole family, and it happened because of your damned obsession, your belief in conspiracies. Of *course* he didn’t kill himself! Of course it *has* to be murder! You’ve been at this game for twenty-five years, so now it has to be *something*!’

‘Please, Mary… That’s not fair.’

She shook her head and turned away, went to the windows and came back, started walking to and fro in agitation, her hands slapping her thighs.

‘He was a scientist,’ she said. ‘He wasn’t cut out to be a detective. He studied physics at Berkeley, designed nuclear reactors, worked for NASA and the American Nuclear Society, had an entry in *Who’s Who*. My husband was a fine man – an intelligent and decent man – then you involved him in your UFOs, in your speculations and intrigues, and he fell for it and became obsessed with it and paid the full price. Do you know what it was like watching him? Seeing him crack and fall apart? Can you possibly understand what it’s like to see your husband go down that way?’

‘He was frightened,’ Epstein said.

‘Damned right, he was frightened. You and your damned institute, your associates, you frightened him to death.’

‘It wasn’t us,’ Epstein protested.

‘It was you,’ Mary said. She stopped pacing and just stood there, looking accusingly at him, her brown eyes bright with tears.

‘Damn you,’ she said.

Epstein had to look away, his gaze roaming around the dark room, taking in the familiar paintings, the furniture and ornaments, all the items he had seen through the years that he had visited this place. Those days were gone now. They had gone with Irving’s death. It couldn’t ever be the same again – not for him, not for Mary. Epstein shivered with grief and rage that matched the woman’s. He wanted to reach out and console her, but he didn’t dare touch her.

‘I saw it coming,’ Mary said. ‘It had been coming a long time. He wasn’t able to fighting his old friends and it tore him apart. I saw it back in 1968, during the House Science and Astronautics Committee Symposium, when he stood up and stated that he had come over to your side and now believed in the existence of the UFOs. He should never have done that.’

Epstein didn’t respond. There was nothing he could say. He simply had to let her talk it out, no matter how much it hurt him. Knowing this, he just sat there, watching her carefully with his tired eyes, as she paced to and fro across the room, from darkness to moonlight.

‘It was after that,’ she said. ‘That was when it began. He believed in it all, gave lectures and interviews, and then, when he started losing his credibility, he simply *had* to believe it. Why not indeed? It was all he had left. First, he was a senior physicist at the University of Arizona, next thing he was a member of your institute, another crank chasing UFOs… You think I’m being cruel? Well, so be it. As far as I’m concerned, he fell in with a bunch of scientific quacks and was ridiculed for it.’

‘You don’t believe that,’ Epstein said.

‘Yes, damn you, I believe it. Irving was a physicist, a man of some authority, but then, when he championed your cause, he lost everything… *Everything*!’ She almost chocked on the last word, actually had to catch her breath, then she blinked repeatedly, looking dazed, and slumped into her chair. ‘Jesus Christ, I feel ill,’ she said.

Epstein flinched when she wept again, felt himself recoil with shame, averting his gaze when she reached for her handkerchief and dabbed at her eyes. He thought briefly of Irving, of his passion for the truth, of how that passion had led him inexorably into the UFO controversy. Epstein hadn’t seduced him. Irving had joined of his own accord. And then, as had happened to so many, something happened to Irving… Epstein thought about it briefly, tried to cast it from his mind, and looked up, feeling pained and confused, to see Mary’s dark eyes.

‘It was you,’ Mary said. ‘I don’t want you to forget that. If it hadn’t been for you and your institute, he would still be alive.’

She burst into tears again, bent over in the chair, moonlight falling on the back of her head as she shook it from side to side. Her sobbing was loud and wracked, filled with pain and despair, and she pressed both hands to her face as if to blot out the truth. Epstein sat there, saying nothing, too stricken to offer sympathy, deeply wounded by what she had said, wondering how he could live with it. Then she sobbed even louder, her body shaking in a fever, so he stood up and went to her chair, bent down to her, embraced her.

‘Oh, God!’ she sobbed brokenly. ‘It’s a lie! It’s all a lie! It’s tearing me apart and I can’t take it and I have to strike out. It wasn’t you, Frederick – I *know* it wasn’t you – *God, it’s all such a mess*!’ She pressed her face to his thigh, her tears flowing, head shaking, holding on to him as if he might vanish and leave her with nothing. Then she looked up at him, her face pale and distraught, and he saw the brown, luminous eyes, stunned with incomprehension. ‘What was it?’ she sobbed. ‘How did it happen? Was it me? *Was it me*?’

He lowered himself to his knees beside her, held her face in his hands, gently shook her head from side to side, murmuring words he would not recall. Eventually, she calmed a little, wiped her eyes dry, sighed, sinking slowly back into her chair, staring up at the ceiling.

‘No,’ Epstein said. ‘It wasn’t you. It had nothing to do with you.’

‘It was suicide,’ she whispered.

‘It wasn’t suicide,’ Epstein said. ‘Irving wasn’t the type to commit suicide. We both know that’s a fact.’

‘Then what…?’ She shook her head from side to side. ‘I just don’t understand… Why on earth…? Who would want to…?’ She shook her head again, bit her lower lip. ‘*I don’t understand*!’

Epstein sighed and stood up, disappeared into the darkness, returned with two glasses of bourbon and handed one to her. She took it gratefully and drank it down, gasped for breath, put her head back, stared up at him as if not quite awake, moonlight touching her pale face. Epstein sipped at his own drink, looking thoughtful, undecided, then he sat in his chair and stared at her, speaking quietly, convincingly.

‘Listen to me,’ he said. ‘I didn’t encourage Irving to join the institute. He wrote to me and suggested we work together. In fact, Irving had been privately interested in the UFOs from about 1955, and the 1965 wave had merely strengthened his growing conviction that the phenomenon had definite scientific importance. Irving never officially joined the institute; his only connection was that he would trade information with us and help us by proxy with his specialized knowledge. It *is* true that he visited us in Washington DC a few times, and that by the time he had gone through our files he had become convinced of the reality of the phenomenon. But I repeat: Irving did all of this on his own – not because we encouraged him.’

Mary studied him carefully, her eyes illuminated in moonlight, the rest of her face in deep shadow, darkness swimming around her. She seemed calmer now, more thoughtful, alert, and she studied Epstein's face as if whether deciding to talk or keep silent. The tension between them was palpable, filled with doubt and recrimination, but eventually she sighed and leaned forward and gave him her glass.

'I need another,' she said.

Epstein nodded and stood up, disappeared into the darkness, returning with two glasses of bourbon and handing her one of them. She didn't say anything, simply turned the glass around, watched the moonlight flash on and off it like tumbling diamonds. Epstein sat down again, crossed his legs, sipped his drink, determined not to push her too hard, to let her take her own time. Finally she drank some bourbon, licked her moist upper lip, then sank wearily back into her chair, lost in shadow once more.

'Okay,' she said. 'What do you want to know?'

'I want to know what frightened Irving,' Epstein said. 'Or what you *think* might have frightened him.'

Mary shook her head and sighed. 'God,' she said, 'I don't know. At least, I'm not very sure. It just seems too ridiculous.'

'Ridiculous?'

'Yes, ridiculous. He never really told me what frightened him. I can only make guesses.'

She leaned slightly forward, elbows resting on her knees, the moonlight falling over her head and glinting off the small bourbon glass.

'You've heard of Dr James E. McDonald?'

‘Of course,’ Epstein said.

‘Then you’ll know that McDonald was once at the University of Arizona, senior physicist in the Department of Atmospheric Sciences and a leading proponent of the extraterrestrial hypothesis.’

‘Yes,’ Epstein said. ‘It’s common knowledge.’

‘Okay. Now Irving certainly didn’t agree with all of McDonald’s theories, but he *did* respect McDonald enormously for his courage in putting forward his unpopular opinions. Indeed, if anyone may be said to have influenced Irving, McDonald would have to be that man.’

‘So?’

Mary shrugged. ‘Back in 1967, when the Condon Committee was being set up, McDonald was on a visit to the Wright-Patterson Air Force Base in Dayton, Ohio, when he accidentally saw the classified version of the 2953 Robertson Panel report. McDonald was shocked to discover that the CIA had had a large hand in the report, and that the classified version of the report, apart from deliberately ignoring some of the most positive UFO sightings, had secretly recommended what amounted to a national brain-washing program and a complete cover-up of official UFO investigations. So, in early 1967, after seeing the classified version of this report, McDonald linked the Air Force’s notorious secrecy policies to the CIA and, on the same day that the Air Force announced the establishment of the Condon Committee, made this controversial information public. Naturally, Irving – who had widespread connections with the scientific community and the media – helped him in this. And from that day on, both he and McDonald became loudly vocal critics of the Air Force *and* the CIA.’

‘Are you trying to tell me that Irving was frightened of the CIA?’

Mary shrugged again, sighed heavily, gazed around her, the bourbon glass

resting on one knee, her free hand lightly stroking it.

‘I don’t know,’ she said. ‘I think he was certainly worried about it. I think that by this time he was beginning to understand that you couldn’t wade too deep in those waters. You know, McDonald was in the forefront of all this, and Irving was well aware of what was happening to McDonald. McDonald attacked the Air Force and the CIA relentlessly, and by 1969 the word was out that those organizations wanted to silence him. Whether this was true or not, it was certainly pretty obvious that McDonald was not having an easy time. The major defenders of the Air Force’s attitudes toward UFOs were Harvard astronomer and author Donald Menzel, and Philip Klass, avionics editor of *Aviation Week*. Menzel had repeatedly explained most of the sightings – including the famous Washington DC sightings – as reflections, mirages, ice crystals floating in clouds, or the results of refraction and temperature inversion. On the other hand, Klass, a man fervently opposed to the extraterrestrial hypothesis and particularly opposed to McDonald, continually tried to ridicule McDonald and put forward his own theory that all UFO sightings were due to coronal discharges in the atmosphere. Anyway, McDonald tore these theories to shreds and made himself a couple more enemies. According to McDonald, Klass tried to ruin him by telling the Office of Naval Research that he, McDonald, had used Navy funds on a trip to Australia to study UFOs, This caused a hell of a scandal and led to the Navy sending an auditor to look at McDonald’s contract and expenditure. The Navy found nothing to pin on McDonald, but it still caused McDonald embarrassment and gave him a lot of problems with the university administration. Then, as McDonald continued to expose Air Force and CIA shenanigans, things grew progressively worse for him. More and more professional ridicule was heaped on him, until, in 1971, the House Committee on Appropriations called him to testify about the SST supersonic transport plane. During his testimony, he was constantly mocked as the man who saw little green men flying around in the sky. McDonald’s work on the SST was his last project. In June 1971, at the age of fifty-one, he drove himself into the desert and shot himself in the head – exactly like Irving.’

Mary suddenly shivered and shook her head from side to side, a clenched fist going to her mouth as if to stifle a sob. She took a deep breath and sank back, her face disappearing in darkness, then the glass of bourbon glinted in the moonlight as she had a stiff drink. There was silence for a long time. A clock ticked on the wall. Epstein hadn't heard the ticking before and it made him feel strange.

'Do you think there's a connection?' he asked.

'I don't know,' Mary said. 'It just seems too ridiculous. But I do know that *Irving* thought about it… and it certainly frightened him.'

'Why?'

'Oh… various things.' The glass came down from her lips to rest on a knee, her fingers curving lightly around it, her wedding ring glinting. 'You know, some strange things have happened to a lot of people involved with UFOs – accidents, suicides, the loss of formerly strong careers – and Irving started taking an interest in such cases. This was shortly after Dr McDonald's suicide – and also after Irving had started his heavy drinking.'

'The drinking was really bad?'

'Yes, *very* bad. I'd never known him to drink before, but then he started to drown in it.' She shivered again, shook her head in a dreamy manner, raised the glass to her lips and had a sip, sighing deeply, forlornly. 'Irving was particularly fascinated by the career of Captain Edward Ruppelt, who headed the Air Force's UFO investigations from 1951 to 1953. According to Irving, Ruppelt was the best man the Air Force ever used during their twenty years of UFO investigations; however, during his three years as head of Project Blue Book, Ruppelt became increasingly convinced that the UFOs were real and of extraterrestrial origin, and that the Air Force was antagonistic to such a hypothesis. According to Irving, this was why, when the Robertson Panel submitted its formal conclusions to the CIA, the Pentagon and the higher

echelons of the Air Force, the CIA refused to give a copy to Ruppelt and his staff. And from that point on, Ruppelt, who was critical of the whole Robertson Panel, found the ground being cut from under his feet. Apparently Ruppelt had been determined to mount a full-scale UFO investigation but faced a lot of opposition from the Pentagon, until, by mid-1953, the Blue Book staff had been stripped down to a total of only three people: Ruppelt and two assistants. Consequently, Ruppelt left Blue Book permanently in August of that year, went to work as a research engineer for the Northrop Aircraft Company, and also wrote his famous book on UFOs.'

'*The Report on Unidentified Flying Objects*.'

'Right. Now what bothered Irving about this case was the fact that Ruppelt's book was a forthright attack on the Air Force's handling of the UFO phenomenon and a plea for a more honest and intensive investigation of it. Obviously, Ruppelt was a believer… Yet in 1959, three years after he had first published his book, Ruppelt revised it, totally reversed his previous stand, and stated in the new edition that UFOs as a unique phenomenon did not exist. One year later he died of an unexpected heart attack.'

Mary finished off her bourbon, placed the glass on the floor, and leaned forward until her face was back in the moonlight, her brown eyes large and misty.

'Irving was bothered by the case,' she said. 'He couldn't understand Ruppelt's reversal. He investigated the case thoroughly, interviewed a lot of people, but couldn't really come up with anything conclusive. There was the possibility that Ruppelt had just become fed up with it, with the constant controversy that surrounded the subject, with the media and the crackpots who hounded him night and day. A possibility. A thin one. Certainly Irving could never accept this as an answer, and he never stopped pondering the riddle. Possibly because of this, he became involved with a similar case: that of Dr Morris Jessup, the noted astronomer and selenographer.'

‘I thought *he* was a crackpot,’ Epstein said.

‘Well, he may or may not have been. In his defense, it’s worth noting that he was a teacher of astronomy and mathematics at the University of Michigan and a researcher whose work led to the discovery of thousands of binary stars. In short, Jessup was an astronomer of considerable repute – until he became obsessed with the UFOs. Apparently, once that started, his ideas became a little crazier, more speculative and bizarre, some derivative, but others strikingly original. As Irving frequently said, this wasn’t all that unusual: a lot of people who developed an interest in UFOs tended to turn pretty strange. Anyway… Irving was interested in Jessup because Jessup had been conducting investigations into possible Naval experiments with field forces that could temporarily dematerialize matter or somehow make it invisible. While this sounded pretty crazy to me – a sort of Flash Gordon fantasy – it interested Irving in the sense that he often felt that the UFOs might work on just such a principle. So… Dr Jessup had been investigating what had been known in books, magazines and various scientific journals as the Philadelphia Experiment.’

‘I know about it,’ Epstein interjected. ‘Allegedly, during 1943, the United States Navy conducted a series of tests at the Philadelphia Navy Yard, at Norfolk-Newport News, Virginia, and at sea to the north of the Bermuda Triangle. Reportedly the experiment was at least partially successful, the ship used being the USS *Eldridge*, and its disappearance allegedly being seen from the decks of the Liberty ship SS *Andrew* and a cargo ship, SS *Malay*. Reportedly, after disappearing, the *Eldridge* reappeared at its berth in Norfolk, then mysteriously turned up at its original dock in the Philadelphia Navy Yard. And according to other unsubstantiated reports, some of the crew died, many had to be hospitalized, and more than a few had gone mad.’

Mary nodded agreement. ‘As I said, Irving was interested in this because he through that the seemingly incredible materialization and dematerialization of UFOs might somehow be based on unusual, controlled magnetic conditions

in which the attraction between molecules could be altered temporarily to cause the transmutation or transference of matter.'

'A sort of space-time machine.'

'Exactly. Matter simply dematerializes and materializes elsewhere – hey presto! Space and time don't exist.'

Epstein raised his eyebrows. 'Go on,' he said.

'Okay. I know. It sounds crazy. Anyway, Irving followed this up and discovered that in 1959, the same year Ruppelt performed his abrupt about-face with the revised edition of his book, Jessup informed Dr Manson Valentine – currently curator honoris of the Museum of Science of Miami and research associate of the Bishop Museum of Honolulu – that he had reached some definite conclusions regarding the Philadelphia Experiment and wanted to show Valentine his manuscript. According to Valentine, he arranged for Jessup to come for dinner on the evening of April 20 that year – but Jessup never made it that far. According to the Miami police, Jessup, some time before six-thirty that evening, drove his car to Matheson's Hammock in Dade County, Miami, and committed suicide by attaching a hose to the exhaust of his car and running the hose inside the vehicle.'

'Was the manuscript found in the car?'

'According to the Miami police report, no.'

Mary rubbed at her forehead and swept the hair from her eyes, then she stood up and visibly shivered and started pacing the room. Epstein watched her, entranced. She was lovely, and she was also a stranger to him, a shadowy figure in the moonlight.

'That made Irving worse,' she said. 'He started to drink even more. He wouldn't talk about it unless he was drunk, and then he seemed incoherent. Incoherence or craziness? I swear to God, I don't know. He was obsessed

with the idea that important UFOlogists were marked men, that they always ended up in a bad way, either crazy or dead. He pointed out to me that Ruppelt had had a lot of problems during his final few years and that those problems might have contributed to his heart attack. He reminded me constantly about McDonald's last few years, about the Air Force's fear of him, about his low standing in the eyes of the CIA and the ridicule heaped upon him by his fellow scientists. Then, on June 12, 1972, precisely one year after McDonald's suicide, another proponent of the UFO phenomenon, scientist and inventor Rene Hardy, was found dead, apparently a suicide by bullet – and this made Irving paranoid.'

She stopped pacing and stared around her, eyes blinking, slightly unfocused, then she bent down and picked up her glass and disappeared in the darkness. Epstein listened to the bourbon being poured, felt the tension within himself, wondered how they had all come to this… to this fear and confusion. When Mary returned, the glass already to her lips, she drank and gazed around her again and then sat down, her legs crossed, her hands shaking.

'Irving had problems sleeping. He started pacing the house each night. He would get up and pace around his study, muttering under his breath. He often looked out the windows. He always looked up at the sky. He started saying that *they* were coming to get him… I never found out who *they* were. He'd been working on something special. He was very secretive about it. The more he worked, the more frightened he became and the less he could sleep. Then one night he was really drunk. I drank with him and we talked. I asked what it was that had him scared, and he attempted to tell me. It wasn't easy for him. The drink had made him incoherent. He started babbling about his colleagues, about how the ridicule had increased; he said the university was putting pressure on him and he might have to leave. Naturally I was shocked. God knows, I was shocked. Then he said that he thought he was being followed, that he just had this feeling.'

Mary shook her head and sighed. She seemed remote and somehow lost. She

gazed at Epstein and he saw her brown eyes, the pain buried behind them.

‘There are lots of stories,’ she said, ‘about mysterious men who contacts people investigating UFOs. Since most of these stories come from the lunatic fringe, they’re rarely given serious attention. Nevertheless, they worried Irving. He told me that in 1955, during that famous UFO flap, Dr Jessup had been called in for an interview at the ONR – the Office of Naval Research in Washington, DC. There it was explained to him that one of his books had been mailed to the chief of the ONR, Admiral Furth, and had subsequently been examined by both the ONR Special Projects Office and the Aeronautics Projects Office. Precisely what was then said between the ONR and Dr Jessup remains unclear, but according to Irving, Jessup started having severe personal problems from then on – and those problems led directly to his suicide… Crazy, yes? Well, *I* thought it was crazy. No matter: the story fascinated Irving and fitted in with his theories.’

She had another sip of bourbon. The clock ticked on the wall. Epstein thought of what the police of chief had said… something about melodrama.

‘Irving thought he was being followed by three men,’ Mary said. ‘He had seen them in a car, outside the house, outside his office, and he felt that they were coming to get him and take him away. Of course, I didn’t believe a word of it. I put it down to his illness. I just thought that all those stories about mysterious, nameless visitors, men usually dressed in black, had sunk into his subconscious and mixed in with his increasing paranoia. But Irving was adamant. He couldn’t let the subject go. He talked about how a lot of the UFOs were described as being surrounded by a glowing, plasma-like cloud; about how the USS *Eldridge* had also been described as disappearing within a luminous green cloud; about how the Bermuda Triangle and the Devil’s Triangle are on approximately the same line of longitude and how many of the airplanes and ships that were lost in those areas were often described as disappearing in similar clouds. Irving thought there was a connection. He thought Jessup had found the connection. He thought that the disappearing

airplanes and ships were tied in with the UFOs, and that the Navy might have stumbled onto the truth through the Philadelphia Experiment. Irving also talked a lot about McDonald, about Edward Ruppelt and Rene Hardy, about how too many reputable people had come to a sticky end – and about the mysterious men in black who harassed UFO witnesses, often claiming that they were from the CIA. All of this scared Irving. It made him pace the house at night. Then, just a few days ago, Irving read about Chuck Wakely… and that final bit of news was too much for him.'

'Chuck Wakely?'

'Yes. Chuck Wakely was a young Miami pilot who almost lost himself in a luminous cloud above the Bermuda Triangle. He was so shaken by his experience that he started to investigate the whole subject – writing about it, lecturing about it, appearing on TV and radio, and generally digging up a lot of old bones. A few days ago Chuck Wakely was shot through the window of his apartment in Miami, reportedly while working on his research. The motive and assailant are still unknown.'

'Coincidence,' Epstein said.

'Maybe,' Mary said. 'But that coincidence didn't particularly help Irving. In the end he just thought of the men following him – and became paranoid.'

Epstein leaned forward, feeling cold, slightly unreal, his gaze drawn to the moonlight in the garden, to the stars in the night sky. What could he say? What could *anyone* say? The story was too bizarre to be accepted and contained by mere logic.

'What was Irving working on?' he asked.

'I don't know,' Mary said. 'That's what frightens me most. I went through his study today and couldn't find a damned thing.'

'No papers?'

‘Nothing.’

‘But he *must* have kept a file!’

‘He had a file as thick as *War and Peace*, but it’s disappeared.’

Epstein sank back again, feeling colder, disorientated, the fear creeping inexorably over him and making the silence sing… Death. Suicide. Careers broken and good men lost. He thought of Irving in his car in the desert, of McDonald and Hardy. Suicide by bullet. Or carbon monoxide inhalation. Suicide and murder and madness: an inexplicable catalogue… Epstein had to know the answers. There was nothing else left to know. He grew old and his time was running out and that invited obsession. Yes, that was the word. *Obsession*: the only word. It was what had taken hold of them all and then driven them ruthlessly. Epstein sighed and leaned forward again, his stubby fingers interlocked, his knuckles forming a broken white ridge that displayed his great tension.

‘A strange story,’ he said.

Mary chuckled bitterly, shook her head and looked away, then raised the glass of bourbon to her lips and had another sip.

‘That’s the story,’ she said eventually. ‘That’s my legacy from Irving. God knows, it’s too inane to be true… but that’s what it came to.’

She drank deeply of the bourbon, let her head fall back and gasped, her tormented eyes focused distractedly on the ceiling and seeing nothing at all. Epstein watched her, entranced, thinking of days long ago, of when his own wife had been alive and they had sat in this room, feeling young and beyond the reach of time, their whole future before them. A sweet innocence had filled those days, had colored Epstein’s fondest memories; now that innocence lay shattered about him and left him with old age. His wife had died five years ago, Irving had killed himself yesterday, and here, in the

timeless, moonlit silence, he and Mary were parting. All their dreams had turned to dust. Each possibility had reached its limit. What was left was a teasing, frustrating mystery that might yet make him mad. Epstein studied Mary carefully, saw the fading of her beauty, the spreading of her flesh, the falling breasts, the glint of gray in her black hair. Life approached and then withdrew. It bled away into the night. It was merciless, taking beauty and hope, leaving little to cling to.

Epstein sighed again. He felt old and very tired. He stood up and gazed nervously around him and then stared at Mary. She was still in the chair. He saw the moonlight surrounding her. Her eyes were luminous and wet with rampant grief, and they tore at his broken heart.

'It's getting late,' he said. 'I'd better go. I'll try to drop in tomorrow.'

'No,' Mary said. 'Don't drop in tomorrow. I'll be packing tomorrow.'

Her voice was flat and remote, a stranger's voice, a chilling sound, and Epstein stood there and blinked and stared at her, not quite comprehending.

'Packing?' he said.

'Yes, packing,' she replied. 'I don't want to see you again. I don't want to see anyone.'

He almost sat down again, the shock shaking him, draining him, but instead he simply raised one hand and lightly stroked his beard.

'It's not you,' Mary said. 'It's everything you represent. It's the UFOs and their victims, Irving's hopes and their destruction; and, most of all, it's my fear that he might have been right. I'm too old for this, Frederick. I can't live within these walls. I want to run from all his friends, from his work and his associates, and I never want to see this house again, to hear a knock on the door. I'm frightened, Dr Epstein. Irving's fears are getting to me. I'm too weak to stay here and fight it, so I'm packing my bags. I'll attend to the

funeral. I don’t want you to be there. I’ll leave as soon as Irving is cremated, and I’ll never come back. Give me a kiss, Frederick. Do that and then go. Don’t talk to me. Don’t say another word. Kiss me once and then leave.’

She raised her big brown eyes. They were stricken and wet with tears. Epstein felt a searing pain, a crippling loss, and then he stepped over to her. The darkness surrounded them, dissolved them and made them one. Epstein leaned down and kissed her on the cheek and then he walked from the house.

CHAPTER SIX

The air-conditioning in the Fontainebleau Hilton, as in most hotels, condominiums and fleabags in Miami Beach, smacked the flesh with a refrigerated chill that stopped sweat in its tracks. Wilson stood in the lobby, glancing around him, gaze thoughtful, taking in the milling people, the WASP residents and tourists, not amused by the superfluous extravagance and inane conversations. He nodded curtly at Fallaci, who stood beside him, looking elegant, and together they pushed their way through the crowd and went up to the desk clerk.

There was a mob at reception, all waving hands and shouting, drunk already and flushed with excitement, trying to sort out their room keys. Wilson stepped back, disdainful, thinking of how common they were, as Fallaci, apparently cool in his white suit, pushed his way to the desk.

‘Excuse me – ’ he began.

The clerk raised a hand and brushed blond hair from his eyes, the eyes turning toward Fallaci, azure blue, opaque with panic, then returning to stare blindly at a man whose elbows straddled the desk. The man had short-cropped red hair, a blotched face, squinting eyes, a garish terry-cloth shirt on his large frame, a cigar between his lips.

‘No!’ he bawled. ‘You listen to me! You keep your crap for your hookers!’

‘Excuse me – ’ Fallaci repeated.

‘No fucking way!’ the big man bawled. ‘We’ve just been to the Ivanhoe, to the Bal Harbour on North Bay Causeway, we’ve been up and down that road, from Hallandale Beach to Lincoln Mall, and we haven’t been offered as much as a fucking john, and now we’re just goddamn tired of it. What sort of jerk-offs do you think we are? You expect us to sleep on the goddamned beach? What the hell do you mean, you’ve got a convention? We come here every year, bud!’

‘I’m sorry, sir, but – ’

‘Don’t fucking “but” me, bud! I’m not here for a goddamned snow job. I’ve got a bus full of people, a fucking Eastern Airlines bus, and I’m not about to drive off again. Fuck you, bud. Where’s the manager?’

‘Excuse me,’ Fallaci said, very polite, very firm, taking the desk clerk’s jacket sleeve and jerking the elbow towards him, his tone of voice and steady, insistent gaze making the man take notice. ‘A Mr Vale,’ Fallaci said. ‘He’s coming to see Mr McKinley. Mr McKinley and I have just been for lunch and wondered if he’d arrived.’

‘Goddamned lunacy!’ the big man said. ‘Where the hell’s the goddamned manager?’ The desk clerk glanced at him, licked his lips, stared at Fallaci, looked down at his desk pad and whispered, ‘No, sir. There’s no message.’

‘Fucking madness!’ the big man exclaimed.

‘Excellent,’ Fallaci said. ‘Mr McKinley is in his room and when Mr Vale arrives he wants him to be sent up immediately. Don’t bother to phone.’

‘Yes, sir,’ the desk clerk said, hastily scribbling the details.

Fallaci retreated, smiling politely at the desk clerk, watching the big man slam his fist on the desk and start bawling again, his passengers milling around him.

‘Well?’ Wilson asked.

‘He hadn’t arrived yet,’ Fallaci said. ‘I told the desk clerk to send him straight up without using the phone.’

‘Good,’ Wilson said. ‘Let’s go up there. Let’s see Mr McKinley.’

Together they crossed the flamboyant, rococo lobby, passing ladies in bikinis and one-piece bathing suits, feet in sandals and clodhoppers, hair bleached blond and purple, piled high, hanging low, expensive bracelets on thin, suntanned wrists, rhinestone sunglasses gleaming. Wilson was not impressed, never had been, never would be, now just wanting to collect his man and then get out and leave Miami behind him. Nevertheless, he seemed part of it: silvery-haired, deeply tanned, his light gray suit businesslike. He might well have been a native of Broward County, just in town for the day.

‘What did you tell him?’ Wilson asked.

‘I said we’d just had lunch with McKinley. He’s going to send Vale straight up when he arrives. We won’t have any trouble.’

They took the elevator to the sixth floor, an extremely crowded elevator, the people noisy and in holiday mood: young girls in skimpy dresses, paunchy men in Bermuda shorts, the former giggling, the latter dabbing at sweat as the elevator moved upward. Wilson stepped out with relief, surveyed the corridor, the bland walls, then he made his way along to room 605, Fallaci trailing behind him.

‘This is worse than Las Vegas,’ Wilson said.

‘I’ve never been there, sir. Every year, I swear I’m going to go, but I haven’t made it so far.’

‘This McKinley,’ Wilson said. ‘You’re sure he’s never met Professor Vale?’

‘He wouldn’t know Vale from my mother. That’s a hundred percent.’

Wilson nodded. ‘I hope you’re right. I’d rather not have anything messy. I don’t want any problems.’

‘This is it. 605.’

They both stopped at the door, a white-painted door with gold embossing. Fallaci glanced at Wilson, saw the nod, and then pressed the doorbell. Obviously Vale was expected – they heard the footsteps within. The door opened without hesitation and McKinley stared at them. He was ruddy-faced, gray-haired, wearing slacks and a flowered shirt, a steely glint in the green of his eyes, no smile on his face.

‘Professor Vale?’ he asked, glancing from Wilson to Fallaci, his hand still resting on the door, as if preparing to close it.

‘I’m Vale,’ Wilson lied. He put his hand out to McKinley. They shook hands and then McKinley indicated Fallaci. ‘Who’s this?’ he asked bluntly.

‘My assistant,’ Wilson said. ‘Mr Fallaci. Do you mind? He’s clean.’

‘You said you’d come alone.’

‘My personal assistant. I’m sorry. But Mr Fallaci travels everywhere with me. He knows everything… *Everything*.’

Wilson stepped into the apartment, brushing casually past McKinley, and Fallaci followed with a smile on his lips, a polite smile, remote. McKinley shrugged and closed the door, looking thoughtfully at Wilson, then he waved at the mock-Renaissance chairs and said, ‘Fine. Take a seat.’ Wilson remained standing. Fallaci circled the room. McKinley said, ‘You gentlemen want a drink?’ and headed straight for the bar. He was a big man, but muscular, clearly fit, his movements light. ‘I’m sorry about that,’ he said, ‘but I’m sure you understand: in this business we have to be careful; we have to

know who we're dealing with.' He reached the bar and turned around. 'The government watches us – ' he began. His eyes flicked to the right, saw Fallaci, an upraised hand, and he cursed and tried to duck to the side and then knew it was too late.

Fallaci's hand chopped through the air, turned on edge, the fingers closed, a small guillotine that snapped McKinley's neck with deadly precision. McKinley gasped and went down, his legs buckling, body spinning, and Fallaci stepped out and caught him in his arms before he cell to the carpet. It had happened quickly, quietly, without fuss, and the dead man now lay in Fallaci's arms, body sagging, leg's outstretched.

Wilson stepped forward and examined him. McKinley's chin lay on his chest. He had urinated in his pants and the stain was spreading out around his crotch.

'Right,' Wilson said. 'Get him into the bathroom. I don't want him dripping on the carpet. Get him in there immediately.'

Fallaci slid his arms deeper under McKinley's armpits and then, with the lifeless head against his chest, dragged him into the bathroom. The walls were a lurid pink, the toilet seat covered in fake fur. Fallaci slung the body over a bath that was made of white marble.

'Christ, he's heavy,' he said.

Wilson didn't respond, his gaze curious, academic, as Fallaci took a short rope from his pocket and tied it around the steel curtain rail. Then he made a short noose. 'You'll have to help me,' he said. Wilson stepped in and tugged at the corpse, his arms under its armpits. Together they lifted the body up, its lifeless arms around their shoulders, raised it until its feet were off the floor, the head under the noose. 'Hold him there,' Fallaci said. He stepped back and turned around. He opened the noose and slipped it over the dead man's head and then tightened the knot. 'That's it,' he said. Wilson let go of the corpse.

The dead man dropped down abruptly, then stopped, spinning slightly, his head jerked up by the rope, his neck stretched, the face bloating, slippered feet dangling just above the tiled floor, swinging gently from left to right. ‘Suicide,’ Fallaci said. ‘He reached the end of his tether.’ He picked up a small stool and set it on its side just in front of the dead man’s swinging feet. Then he straightened up, grinning.

‘Okay, sir?’

‘Okay.’

They left the bathroom and closed the door, went back into the main room, and stood there, glancing around in a casual manner, intrigued by the decor. The colors were garish, the furniture a bizarre mixture of styles, imitations of late-Renaissance and Victoriana and Art Nouveau, an elaborate chandelier fixed to the ceiling, intricate mouldings, bad paintings. Wilson sat in a chair, his azure gaze calm but remote, as if focused elsewhere. He looked up at Fallaci, saw him standing at the windows, framed by the rippling green of Biscayne Bay and the sky’s dazzling white haze.

‘I hope he’s punctual,’ Wilson said.

‘He should be here any minute.’

‘And you’re sure he’s never met that McKinley?’

‘It was all arranged by phone.’

Wilson checked his gold cuff links, crossed his legs the other way. ‘What about my voice?’ he asked coldly. ‘He might notice the difference.’

‘No, sir,’ Fallaci said. He started wandering about the room. ‘The arrangement was made through a third party. Your voice won’t mean a thing to him.’

Wilson glanced at his wristwatch. ‘We were informed that he was punctual.’

‘That checks,’ Fallaci said. ‘He’s a punctual man. That doorbell should ring any second now.’

The bell rang a minute later. Wilson got to his feet. Fallaci looked at him, nodded, went to the door, opened it and took a step back and said, ‘Can I help you?’

‘I’m Professor Vale,’ a man said. ‘Are you Mr McKinley?’

‘No, sir. I’m his secretary.’

Fallaci stepped aside and Vale entered the room, a slim man, quite short, beard and hair flecked with gray, wearing white pants and a colorful flowered shirt, a tennis racquet held in his right hand.

‘McKinley?’ he asked.

‘Yes,’ Wilson said. ‘Hello.’ He stepped forward and shook Professor Vale’s hand. ‘I’m glad you could come.’

Professor Vale smiled frostily. He seemed young for his fifty years. ‘Your man was very persuasive,’ he said. ‘If a little oblique.’

Wilson returned the smile. ‘Yes,’ he said. ‘I’m sure he was. But I’m also sure that you’ll understand our discretion when we finish our talk.’ He nodded at the bar. ‘Would you like a drink, Professor?’ Vale wiped sweat from his brow and said, ‘Yes, thanks. Rum and coke. Lots of ice.’

Wilson nodded at Fallaci. ‘A white wine for me,’ he said. Fallaci went to the bar as Wilson pointed to a chair and said, ‘Take a seat, Professor. Relax.’ He indicated the tennis racquet in Vale’s right hand. ‘Did you have a good game?’

‘Pretty good,’ Vale said.

He grinned and sat down, placing his tennis racquet on the table, stretching his legs and wiping the sweat from his forehead with a folded white handkerchief. ‘It kills me,’ he said. ‘I don’t know why I do it.’ He patted his stomach and said, ‘I’ve got to keep this down. An academic’s obsession.’ Wilson smiled at the self-mockery. Fallaci brought them their drinks. Wilson sat facing Vale while Fallaci retreated to stand behind the bar and sip at the drink he had made for himself.

‘You play often?’ Wilson asked.

‘Only on vacation,’ Vale said. ‘I don’t like vacations all that much, so it helps pass the time.’ He drank his rum and coke with relish, wiped his lips with the back of his free hand, then sighed and stared steadily at Wilson, sizing him up. ‘All right,’ he said eventually. ‘What do you want, Mr McKinley? Your man said it was an offer of work, and right now that interests me.’

‘Just how much did my man tell you?’ Wilson asked.

‘He told me that you represented a European-based commercial company dealing in electronics, aerospace technology, communication satellites and assorted areas of high-energy research. He also said that you had produced components for ASAT warheads and European and American ICBMs. He said, further, that you were under contract to NASA for the production of various rocket components, but that you were intending to expand dramatically. Finally, he said that you were desperately in need of civilian scientists and technicians with experience in aerospace technology, and were willing to pay well for their talents. He said no more than that.’

Wilson smiled. ‘He was told to be brief.’

‘He was,’ Vale said. ‘Far *too* brief. But I’m interested.’

Wilson smiled again and put his chin in his hands, his elbows resting lightly

on his knees, on his immaculate pants.

‘Well, Professor Vale, your information is essentially correct. I represent Air Communications and Satellite Systems, better known as ACASS, a Frankfurt-based, internationally financed company that specializes in the production of advanced electronic communications packages and spy satellite components under contract to European and US government defense establishments.’

‘I know about ACASS,’ Vale said. ‘I’ve often used your components.’

‘Yes,’ Wilson said, ‘that stands to reason. You’ve worked in the past for the USAF Space and Missiles System Organization in San Dierga, California; for the Linear Accelerator Center of Stanford University; and for the Lawrence Livermore Laboratory near San Francisco. You are, at the moment, an Advanced Space Programs Coordinator at the top secret Aerospace Defence Command Cheyenne Mountain Complex in Colorado Springs, Colorado. At these various posts you have specialized in research into advanced advanced ICBMs and anti-satellite weapons, and you’re presently engaged in research into high energy laser beams and particle beam weapons, with particular interest in the Semipalatinsk plant in Russia… Given this, you would have certainly used our components. Now we’d like to use you.’

Professor Vale could not help grinning. He glanced at Fallaci. The latter took his half-empty glass and topped up the rum and then handed it back to him.

‘You’ve certainly done your homework,’ Vale said.

‘Yes. We’re efficient.’

Vale smiled again at Wilson, his eyes glinting above his glass. He sipped his rum and then sat back in the chair, his boyish face thoughtful.

‘I’m under contract to USAF,’ he said.

‘That contract ends in two months.’

‘Okay,’ Vale said. ‘Talk.’

Wilson leaned forward, smiling, amused just a little, thinking first of Vale’s understandable human vanity, thinking next of the man hanging in the bathroom, his neck snapped where the rope would undoubtedly scar it. Another suicide. Naturally.

‘Professor Vale,’ he said, ‘we need men like you because we are, as you rightly said, expanding dramatically. Put simply, ACASS is planning to set up an overseas satellite launching base that will break the superpowers monopoly of space by launching spy satellites for any Third World country will to pay what we ask. At the moment this capability is available only to America and the USSR, so there is, as we see it, an open market for the sale of such satellites to any smaller developing country that’s concerned with protecting its borders and wants a sophisticated early-warning system at a reasonable price. We can fill that need. We can construct simple, efficient rockets. We can launch those rockets for anyone who pays and there are plenty of customers.’

‘No doubt you’ll have plenty of customers, but where will your base be?’

‘A certain Third World despot in Africa has leased us approximately one hundred thousand square kilometers of his country in return from a rent of fifty million dollars a year to be paid in local currency after our first commercial launch, which will be five years from now. Given that this country’s inflation is running at about eighty-five percent a year, the payment will be relatively negligible by the time it is due. We have also offered to launch a satellite free of charge, but on the condition that the so-called President pays for the actual production of the rocket. In short, what we’ve been given by this black lunatic, virtually for free, is one hundred thousand square kilometers of territory, total autonomy over that territory, full immunity from any prosecution by the state, full control over who is allowed

to remain in the territory, and absolute disciplinary control over all natives within our designated area.'

'That's insane,' Professor Vale said.

'That's a fact,' Wilson said. 'That's the deal that was worked out between ACASS and the so-called President in Africa, and the contract has been signed, sealed and delivered. Photocopies of the contract are on my boat and await your inspection.'

Vale studied Wilson carefully, tapping his teeth with his glass, obviously startled by what he had heard, just as clearly intrigued.

'You can't build a rocket that cheap,' he said.

'Yes,' Wilson responded promptly, 'we can. The basic idea for the rocket came from some German scientists who originally worked on the V-2 rocket for the Nazis. After the war, one of those scientists went to Egypt to design rockets for President Nasser, retired to Austria, and then came to ACASS. Another came to the United States with Wernher von Braun, became an American citizen and leading light of the Kennedy Space Center, retired three years ago and has since worked for ACASS. The ACASS rocket is very much like a model the Nazis were perfecting when the war ended: easy to build, cheap, but efficient. Its basic unit consists of a tube filled with an oxidizing agent and another filled with diesel fuel; when these liquids combine they ignite and the rocket takes off. Also, instead of mounting rocket stages on top of one another, the ACASS rocket is simply a large bundle of standard units: the greater the load, the more units you include. It is, in short, a mass-produced rocket, fully functional and operative.'

'I want to see the plans.'

'You can see them. They, also, are on my boat.'

Vale sat back in his chair, tapping his glass against his teeth, studying Wilson

and then gazing around the room, taking it all in. Wilson sat there, saying nothing, thinking of the dead man in the bathroom, thinking also of what would happen to the world if ACASS had their way. Would the idiocy never cease? Could the fantastical be controlled? Wilson thought of the dead man, of the commercial company he had represented, of the many scientists who would take on any kind of work so long as the price was right. Professor Vale would not be one of them. Professor Vale would not be paid. The good professor, with his vanity and greed, would be put to use elsewhere.

‘I’m interested,’ Vale said, ‘but I want to see some documentation. I want to see all your contracts, I want to study the rocket designs, and after that, if I’m satisfied that you’re legit, I might discuss my own terms.’

‘Excellent,’ Wilson said. ‘I’m sure you’ll find them impressive. They’re all in the safe in my boat. Could you go there right now?’

‘Now?’

‘Why not?’ Wilson said. ‘You’re only here on vacation, you said yourself that you were bored, so let’s go to my boat, take a trip, some food and wine, and you can study the documentation at your leisure, then go home and decide.’

‘I don’t know…’ Vale began, hesitating.

‘Is your wife here with you?’ Wilson asked.

‘Yes.’

‘Then why don’t we collect her and take her along with you? I’m sure she’ll enjoy being on the boat.’

That was enough for the good professor. ‘I think I’ll go on my own,’ he said. ‘I mean, I don’t want her hanging around when we’re discussing business. What the hell, let’s just go.’ He finished his drink and stood up, licked his

lips and nodded affirmatively, then want to the bar, passing Fallaci, and set his glass down. ‘Where’s your boat docked?’ he asked.

‘Another drink?’ Fallaci said.

‘No, thanks,’ Vale replied.

‘Pompano Beach Marina,’ Wilson said. ‘We can be there in less than an hour.’

‘You have a john?’ Professor Vale asked. Fallaci touched his elbow lightly. ‘Yes, sir,’ Fallaci said. ‘That door there. At the far end of the room. The first door on your left.’ Vale thanked him and walked away, turning into the second bathroom. Fallaci then looked at Wilson, grinning nervously. ‘That was close,’ Wilson said.

They all left shortly after, left the dead McKinley dangling, closed the door and went down in the elevator and walked out through the lobby. The sudden brightness was dazzling, beating off the white walls, off tall buildings and sidewalks and streets, the sea beyond the palm trees. Fallaci walked on ahead. He led them into a parking lot. Wilson sat in the rear of the car, talking casually to Professor Vale, as Fallaci drove into Collins Avenue, his eyes fixed on the busy road.

Professor Vale was loquacious. The two rums had affected him. He kept looking out the window, at the hotels and condominiums, at the surfers and well-dressed passers-by, at the bored wives and gaudily-dressed whores and the packed, noisy sands. Miami Beach glided past them.

‘You know Miami, Mr McKinley?’

‘Not really,’ Wilson replied. ‘I used to have my boat docked in Norfolk; I only came here this year.’

‘You picked the wrong year,’ Vale said. ‘This is the year of the pig. I’ve been

coming to this place for fifteen years, but it's not what it used to be. Cubans and blacks, homosexuals and hookers; you get these kids from the University of Miami and they're wrecking the place. I mean, I've had it up to here. You wouldn't believe what goes on. I'm a white, Anglo-Saxon American and I don't mind admitting it. But take a good look around you. What do you see? Drive through 79th Street or Biscayne Boulevard or Kennedy Park; you'll get a blowjob in the front seat of your car before you know where your billfold's gone. I mean, these hookers are everywhere. They own Lincolns and Cadillacs. You just go into the Boom-Boom Room or the Poodle Lounge in the Fontainebleau and you'll see them shaking their tails for all they're worth, picking up on the tourists. Either that or it's the fags, from Coconut Grove to Fort Lauderdale: they have it organized so well that the 21st Street sea wall is no longer the place to go for a broad – the fags have cleared out the area. The future America is in Miami; the Brave New World is around the corner: prostitution, male and female, a lot of porno movie houses, filthy habits and VD and drugs and organized crime. That's Miami, Mr McKinley. It's the world delivered by science. I look around me and I wonder what it means and then I look to the future. Fuck America, I say. What's America given me? It's given me radicals and communists and anarchists and degenerates, and it's offering me Miami and Las Vegas and cesspits like New York. Fuck America. Who needs it?'

Vale shook his and chuckled, short and slim, almost boyish, his bearded face now showing his fifty years, the lines good-humoured and youthful. Wilson glanced at him, sardonically amused, and just then the car came to a halt.

'Here we are,' Wilson said.

They left the cool of the car for the blinding light of the marina, squinting and then stretching themselves, adjusting to the tropical heat. Fallaci led them to the boat, a neat Italian, moving fluidly, his eyes darting left and right, their soft brown hiding ice, double-checking everyone in sight, every movement that could indicate trouble. Bronzed girls in bikinis, blond youths in tight

shorts, gawking tourists and surfers and lifeguards: Fallaci watched them all carefully. The sky was a dazzling haze, the water went from blue to green, and the boats in the harbour, all shapes and sizes, reflected sunlight from chrome and polished wood, their colored sails flapping rhythmically.

Professor Vale was impressed. He was particularly impressed by the boat they stopped at. A high-powered luxury cruiser, about sixty feet long, it had the look of a floating penthouse and was clearly a rich man's toy. Fallaci led them up the gangplank, onto the polished, gleaming deck, and a servant wearing an immaculate starched white jacket stepped forward and bowed to them. Wilson followed them aboard, his gelid gaze scanning everything, then he waved to the door directly facing them and said, 'In there, Professor.'

Vale glanced around him, at the blue sky and green-blue sea, and said, 'If you don't mind, I'd prefer to remain outdoors and pretend that I'm healthy.'

Wilson smiled understandingly. 'That's fine with me,' he said. 'We'll just take the boat out a few miles before commencing our business. We can talk over lunch.'

The waiter stepped forward again, bowing slightly to Vale. He had dark skin and Oriental eyes, his face curiously smooth and unlined.

'A drink, sir?'

'Rum and coke.'

'White rum?'

'No, dark.'

The waiter bowed again and then retreated, back in through the nearest cabin door.

'Where does he come from?' Vale asked.

‘Hawaii,’ Wilson lied.

‘For a moment there I thought he was Korean, but then he seemed a bit different… Hawaii… should have known.’ Vale shrugged and rolled his eyes, grinning at Wilson and turned away, looking over the other boats, the pristine white walls of the marina, the shimmering haze above the horizon where the sky met the sea. ‘This is some boat,’ he said.

‘Thank you,’ Wilson said.

‘If you meant to impress me, you’ve succeeded.’

‘Good,’ Wilson said. ‘We like to please. It’s all part of the service.’

The waiter returned with two drinks on a tray while Fallaci, who had been standing near the cabin, disappeared through the door. Wilson and Vale took their drinks, the waiter bowed and departed, then Vale leaned against the brass railing and stared around him with interest.

The boat had a large crew, all dressed in white, all busy at their various tasks, working methodically, silently. There was something strange about them. Vale didn’t know what it was. They were all small and slim, dark-skinned, with narrow eyes, and Vale found himself refusing to accept that they came from Hawaii. He watched them with interest. They made him feel a bit unreal. They never glanced at one another, never spoke, and they kept their heads down. Vale shivered a little. He felt decidedly odd. He drank some rum and grinned at Wilson, still not knowing who he was, then the boat’s engine rumbled and the boat moved slowly out of the harbour.

‘Where are we going?’ Vale asked.

Wilson shrugged. ‘Nowhere special. We’ll just go out a short distance, maybe ten or fifteen miles, and then anchor. We’ll have lunch and then you can study all the documentation.’

The boat cruised out of the harbour, past white-painted buildings and other boats, the palmettos casting shadows on the people wandering lazily back and forth. The marina gradually fell behind them, revealing the immense sweep of the coastline, yellow beaches dominated by condominiums and baroque hotels. Eventually there was only the sea, green and blue, reflecting sunlight, waves rippling in pearly lines around the boat and streaming out in their wake.

‘Beautiful, isn’t it?’ Wilson said.

‘Yes, it is,’ Vale responded. ‘But I’ve always felt slightly weird out here. You can’t ignore all the stories.’

‘Of course… the Bermuda Triangle.’

‘You sound sceptical,’ Vale said.

‘Oh, I’m not completely sceptical. When so many boats and planes disappear, one can’t help being curious.’

‘Right,’ Vale said. ‘You simply can’t ignore the facts. Sinking boats you can accept. Crashing planes you accept. But other events have never been explained, and they make your flesh creep. What I mean is, I’m a scientist. I try not to believe in magic. But cases like that… I don’t know… We still don’t have the answers.’

‘What about UFOs?’ Wilson asked.

‘What about them, Mr McKinley? I won’t buy it that UFOs are the problem, here or anywhere else. I draw the line at flying saucers. The proof for UFOs is negligible. I’ll believe they exist when I see one… and I don’t think I’ll see one.’

‘Really?’ Wilson said, sipping his wine and smiling thinly, gazing over the railing at the sea, at the cloudy horizon. ‘I thought you might have seen one

over the Cheyenne Mountain Complex.'

'Why should I see one there?'

'Oh, I don't know…' Wilson gazed at the clouds on the horizon, coming closer, expanding… 'It's just that I'd heard UFOs were frequently observed over scientific and military establishments. Given that, I thought they might have been seen over the Aerospace Defense Command.'

'Balls,' Vale said. 'Anyway, the Cheyenne Mountain Complex has been built to survive a nuclear war – no matter how destructive – and as such can't be seen from the air. In fact, that complex is a complete underground city, existing deep inside the mountain, resting on giant shock absorbers, webbed with miles of underground tunnels, and completely sealed off from the outer world. Believe me, McKinley, when you work in that place you're not able to see *anything* in the sky – you don't see a damned thing. Our job is to track spy satellites. Those are all we've ever tracked. Neither the radar nor the telescopes have ever picked up anything else. UFOs just don't exist.'

Wilson smiled and sipped his wine, let the cool breeze fan his face, kept his gaze fixed on the sea, on the clouds near the horizon, that horizon which forever receded and led out to Bermuda. This boat would not reach Bermuda. It would drop anchor and then wait. The good professor, in an intoxicated dream, would find that facts have no credence.

'I don't believe it,' Vale said.

'What?' Wilson asked.

'Spy satellites being sold in the marketplace. That's just fucking incredible.'

Wilson didn't respond. He watched the land disappearing. The sea was calm and the sky was a silvery-blue sheet, with white clouds drifting under it. Professor Vale continued talking. He seemed unsteady on his feet. He sipped his drink and repeatedly blinked as he glanced vaguely around him. Wilson

listened attentively. The professor was talking about pulse-power weapons. The boat stopped moving and the anchor was lowered and the professor kept talking. The crew took up their positions. Fallaci returned to the deck. The sea washed around the boat, rolled away to the horizon, and Wilson smiled when he saw a dark mass spreading out just below them. Professor Vale kept talking. He suddenly seemed very drunk. Jets of steam were rising from the sea and forming into a cloud. This cloud surrounded the boat.

'We didn't invent the pulse-power beam. The Russians didn't invent it either. The British invented it eighteen years ago, but kept it under tight wraps. Now we're expanding its potential. We're running a race with the Russians. We're utilizing it as a defensive weapon, for communications and reconnaissance, and we're making quantum leaps in our technology, quietly forging ahead. These laser beams are amazing. Their possibilities are limitless. They can knock out spy satellites, zero in on flying rockets, and even show up the number plates of cars from two hundred miles up – they can pinpoint just about anything. Think of what that means, McKinley. The Cold War has been superseded. What we now have is a Balance of Terror in a post-nuclear age. People don't know what's happening.'

Wilson didn't reply. The silence rang in Vale's ears. He shook his head and saw the shifting of the clouds, a silvery haze all around him. He didn't know what was happening. He felt very peculiar. Abruptly, sweeping away his drunken ebullience, he felt a fierce, senseless dread. What the hell was going on? He felt sick and disorientated. His throat went dry and his eyes went out of focus and the deck seemed to tilt.

Vale dropped his glass. He watched it falling to the sea. It took a long time going down, turning over, reflecting sunlight, the light flashing off it in dazzling striations of incredible beauty. He didn't see it strike the water. The hot air was beating at him. He looked sideways at McKinley – McKinley? – and saw icy blue eyes and gray hair.

Not gray hair: silvery. Not silvery: a shimmering white. He was here,

Professor Vale, I am here to make a deal with McKinley. Then fear. The inexplicable. The white hair and azure eyes. Professor Vale tore himself from this vision and glanced wildly about him. The boat was silent and still. The sea was boiling up around it… Roaring and boiling up around them all in immense walls of green steam.

‘Jesus Christ! What the hell…?’

Vale grabbed hold of the railing, the deck shuddering beneath his feet. The huge clouds of steam were rising from the sea and surrounding the boat. Vale couldn’t believe his eyes. The clouds of steam blocked out the sky. They had formed a perfect circle around the boat, half a mile in diameter. Now Vale wanted to scream. The deck shuddered again and groaned. Vale looked over the railing, down the side of the boat, and saw an immense, dark mass just below the surface, spreading out, slowly rising.

‘The Triangle! Oh, Jesus…!’

Vale slapped his forehead with one hand, terror sweeping away his senses, glanced around and saw McKinley, azure eyes and white hair, saw the crew, the Orientals, coming toward him, small and slim, moving silently. He tried to run, but it was hopeless. Where could he run to? Paralyzed with fear, he gripped the railing, trying to take in the nightmare.

‘Oh, fuck! *Oh my God*!’

Suddenly, the sea roared. He stared at the distant clouds. Now much closer, they boiled up from from the waves to form a wall that blocked out the whole sky. Then the spiraling waves exploded, the spray sweeping around glinting steel. A perimeter of spikes surfaced, faraway, beneath the steam, all triangular, splitting the water like metal fins, thrusting up, growing larger.

Vale heard the sound of his own blubbering, saw the white ridge of his knuckles, his rational self stunned by disbelief and a throttling terror. All that

and something else: an unreality that drained his senses. His head was spinning and he recalled the falling glass and realized he was drugged.

He tried to focus on McKinley, wondered who he really was, saw his icy blue eyes and white hair, the wall of clouds beyond him. The boat was trapped inside those clouds. The green steam swirled and drifted. The triangular grids rose from the sea, growing larger, spitting water, a great circle of gleaming steel teeth that surrounded the boat.

Vale couldn't believe what he was seeing. The only reality was his fear. The deck shuddered beneath his feet, the boat rocking and rumbling, and he glanced down and saw an enormous mass rising to the surface.

'*Grip the railing*! *Hold tight*!'

Someone was shouting at him. He licked his lips and saw McKinley. The azure eyes were uncommonly bright and intense, hypnotizing him, chilling him. Be he did as he was told. He saw the wall of steel around him. He felt the presence of the massed crew behind him, but he didn't dare look at them.

The monster's steel jaws were closing. Vale's eyes were drawn to the boiling sea. The dark mass was still rising and spreading out, and then it struck the boat's hull. Vale felt it and heard it: the deck shuddered and shrieked. There was a harsh, metallic rumbling, water rushing and hissing, then the boat suddenly rocked from side to side, settled down, finally steadied.

Vale looked on, mesmerized. The whole boat was slowly rising. The sea poured away between the rising walls, and an enormous steel deck broke the surface. This steel deck was smooth and solid, a quarter mile in diameter, and the walls that had looked like huge fins went right around its perimeter. The sea poured out through those walls, the enormous deck pushed the boat up, and the triangular fins of the perimeters started moving toward one another, rising high and curving in above the boat like interlocking, giant fingers.

Vale gazed up in awe. The steel walls curved high above him. They were roaring and hissing, water rushing down their sides, and they moved in toward one another to block out the steaming green clouds. Vale stood there, paralyzed. The deck was steady beneath his feet. The triangular walls came together high above to form an immense, empty hangar.

The walls locked together, reverberating. A bright light filled the gloom. Vale looked across that great floor of steel and saw nothing but curved walls. Then the floor began to rumble. Vale almost gagged with fear. The floor began to sink, like some enormous elevator, and the walls soared all around him, an immense globe of steel, until the light became a blazing white haze that turned the dream into reality.

Sweeping vistas of steel and glass. A maze of ladders and catwalks. Silhouettes moving through the white haze, the air vibrating and humming. Vale saw it and felt awe and choking horror. Something cold touched his neck and then scorched it and he dropped into Hell.

CHAPTER SEVEN

Richard was standing before the large windows of the front room of the apartment, a glass of cheap red wine in his shaking right hand, his eyes bloodshot and blinking, slightly glazed with constant fear, looking over an adventure playground, the grimy rooftops of Finsbury Park, the gray sky that seemed to smother the distant maze of the City of London. The sky obsessed him, mesmerized him, filled him with dread and fascination, glided through his dreams and colored his waking hours with the promise of more horrors. It was six in the evening, darkness advanced across the skyline, and Richard raised his glass of wine to his lips to drink deeply, compulsively.

All white. Everything. He closed his eyes and relived the nightmare. His hand shook as he had another sip of wine and then opened his eyes again. He saw the labyrinth of the city, the distant dome of St. Paul’s, and above it, the darkening, cloud-filled sky that took him back to the start of it.

Richard shivered violently, finished his drink and turned away, then he left the room and entered the kitchen and poured some more wine. He had a sip and then glanced around him, at empty bottles and unwashed dishes, crumpled newspapers on the table, on the floor, the signs of total neglect. He had been here for five days and had only gone out for the papers. He couldn’t eat, he couldn’t sleep, he rarely washed, and the wine helped to make the long days pass.

He left the kitchen, stood briefly in the hallway, drank more wine and stared at each of the rooms in turn, at the comforting brightness. Every light in the apartment was turned on. They had been on since he arrived here. He didn’t

dare turn them off lest the nightmares returned and jerked him out his restless sleep, screaming dementedly, his thoughts haunted by phantoms.

All white. Everything. He couldn't believe what had happened. He could believe even less that he had awakened three days later, alone, on the hills of Dartmoor, thirty miles from Bodmin Moor, the drunken woman and her car no longer there, the missing days a mystery. Richard shuddered again at the very thought of it, put the glass to his lips, drank deeply, and went back to the lounge, wishing that Jenny would come.

He had phoned her an hour ago, the first call since his return, and had noticed the confusion in her voice, the hint of anger beneath it. In truth he couldn't blame her; more precisely, he didn't care; now driven by the singular, desperate need to talk it out of his system.

All white. Everything. His last memory was of the whiteness. He recalled the flying disks, the enormous mother ship, the silhouettes moving to and fro in the dazzling light – then nothing: oblivion. A nauseous awakening on Dartmoor; stumbling down the hill and hitching a lift and being told by the driver that it was Sunday. He hadn't understood that at all – his last recollection was of Thursday – and sitting there in the truck beside the farmer he had thought he was going mad.

Now he stood by the window, drinking wine, shaking in spasms, rubbing his unshaven chin and looking out as the city's lights blinked on. The lights were floating in darkness, a silvery web, a sparkling mosaic, and they merged with the lights in his head and took shape as the nightmare…

His feverish thoughts had filled the nights, making him pace from room to room through the apartment, trying to shake off his demons. The fear was always present, all around him, deep inside him, a living thing that breathed against his neck and made him drink even more. Exhausted, terrified, he dreaded sleep, yet had to sleep, sitting upright in a chair, groping blindly for the bottle, muttering vague and incoherent protestations as the silence

tormented him.

Richard couldn’t understand it, couldn’t touch it or see it. What it was, what it meant or might mean was something concealed from him. So he drank and relived it. He wondered constantly about the woman. He saw that enormous flashing mass, the flying disks, the jolting car; and he sobbed as the white light flared up and sent him into oblivion.

It had started five days ago. He had paced the apartment all that time. The world outside, both by day and by night, now seemed alien and threatening. Richard thought about reality. He wondered what reality was. He was pondering this riddle, losing himself in labyrinths, when the shrill ringing of the doorbell cut through him and made his nerves twitch.

‘Jesus Christ!’ he whispered.

Turning away from the window, he stepped forward, then stopped, had another sip of wine and licked his lips and let his nerves settle down. It was all too much for him: at eighteen he felt like fifty. He glanced around the cluttered room, at the squalor of his hibernation, and he felt the shame reaching up to stroke him and make his cheeks burn. Then he licked his lips again, shook his head and stepped forward, leaving the room and going along the straight hall, the lights stinging his eyes.

The front door had stained-glass windows, pretty mosaics of lead and wire, and he saw her silhouette at the other side, an indistinct, smokey form. He froze there, frightened again, the fear followed by further shame, wondering if it really was her, wondering why he should doubt it. Then he shook his head from side to side, cursing softly, trying to grin, but the grin died pathetically on his lips when the bell rang a second time.

‘Jenny?’

‘Yes! What’s the matter? Let me in! Why in God’s name are you whispering

like that? What on earth's going on in there?'

Richard unlocked the door, fumbling clumsily, nervously, then stepped back and pulled the door open and studied her carefully. Jenny didn't step inside, simply stared at him, shocked, her right hand reaching up to her forehead, brushing her auburn hair from brown eyes.

'What on earth…?'

'Come in.'

'*What*?'

'I said come in.'

'What on earth have you been doing to yourself?'

'Don't just stand there. *Come in*!'

She stared at him, brow furrowed, a forefinger to her lips, then she shrugged and stepped reluctantly inside, her shoulder brushing against him. This brief contact was electrifying, jolting through him as a shock – not sexual; more a sudden awareness of being outside himself. He closed the door and turned around, saw chocolate-colored eyes, a moon-shaped face, her auburn hair a tangled web of curls, her long legs in blue denims. She returned his gaze, studying him, then shrugged and moved away, wandering lazily along the hallway, glancing into all the rooms, sighing despairingly when she saw the awful mess: the empty, discarded bottles.

'Very nice,' she said mockingly.

Turning back, she stared at him, a quiet appraisal, clearly critical, then she shrugged and entered the living room and he dutifully followed her. Stopping again in the middle of the room, she surveyed the untidy mess on all sides, then she sighed and sank into an armchair, her legs languidly outstretched.

She was clearly disgusted.

‘I don’t believe this,’ she said.

Richard didn’t reply. He simply raised his glass and drank. Then he went to the windows and looked out to see the lights of the city. The whole of London was ablaze, the individual lights seeming to join together in darkness, and as they merged, they fused together in his thoughts, making him turn away, shivering. Jenny sat back in her chair, her shabby parka across her lap, her legs still outstretched, attractively long and slim, lethargically mocking him.

‘Five days,’ she said. ‘You said you’ve been here for five days. I didn’t really believe it when you told me, but now I’m convinced.’ She raised both her hands, indicating the squalid room, then the hands dropped to rest on one another as her gaze took him in again. ‘You and the apartment look the same,’ she said. ‘You both look fucking terrible.’

Richard tried to grin and failed; instead, feeling embarrassed, he looked around him before slowly, reluctantly, returning his gaze to Jenny, wondering what he could say to her.

‘It’s a mess all right,’ he said.

‘Yes,’ she said, ‘a bloody mess. What the hell have you been doing all this time. Having an orgy?’

This time Richard managed a grin, a weak offering, not his usual, then his blue gaze, which once had been candid, slid furtively sideways.

‘What are you looking at?’ Jenny asked.

‘Nothing,’ Richard replied.

‘Take a good look,’ Jenny said. ‘It’s worth studying. I’ve never seen the

place like this before.' Her eyes were bright with anger, flecked with steel, wondering over the littered armchairs, the stained settee, the cluttered tables, the bottles dropped carelessly to the floor, the newspapers and magazines. 'You only got this apartment so cheap,' she reminded him, 'because my friend is still holding the lease, Now it's not a great apartment, but it *is* pretty good, and I don't think you'll impress her too much by turning it into a pigsty.'

Richard finished off his glass of wine, shuddered again and turned away, picked a half-empty bottle off the table and filled his glass and then had another sip.

'Don't offer me a drink,' Jenny said. 'The sight of you has already put me off it.'

'Sorry. I didn't think. You want one?'

'No.' Jenny smiled bleakly, not removing her steady gaze from his face. 'Even your parents think you're still down in Cornwall. What the hell's going on?'

Turning away, Richard went to the windows, and stood there for some time, looking out, a man lost in his thoughts.

'I don't know,' he said eventually. 'It seems crazy. I don't think you'll believe me.'

'Try me.'

He turned back to face her, his eyes bloodshot, remote, the light shining on the wine in his glass, the glass visibly shaking.

'All right,' he said. 'I didn't get to St. Ives. Something happened on the way to St. Ives that I just can't explain. You'll probably think I've gone mad.'

‘And have you?’

‘What?’

‘Gone mad.’

‘I don’t know. I’m not sure.’

He shivered again, his gaze slipping furtively sideways, finding the ghost of himself in the squalor, his distraught other half. Then he told her his story, talking hurriedly, almost frantically, pacing to and fro, his hands shaking, spilling wine, running nervous fingers through his uncombed hair, his eyes avoiding her face. Surprisingly, it was now easy to tell the tale – more than easy: a burning necessity – and as he listened to his own voice, as the words came tumbling out, he felt that he was coming apart, losing his old, protected self, changing into someone wiser, less assured, aware of life’s hidden mysteries…

‘That was near King Arthur’s Hall. King Arthur’s Hall is on Bodmin Moor. The last thing I remembered was the blinding white light and those silhouetted figures… Like a dream, a kind of wide-awake vision, not real; and I screamed and then heard myself groaning and had nightmares and woke up… Inexplicably, I was back in Dartmoor.’

He was silent for a moment, as if questioning himself, doubting his own words, then he said, ‘Can you imagine the feeling? I was dazed and scared shitless. It was cold, but I was burning all over – my hands were burnt red. I mean, I couldn’t accept it. I didn’t know what had happened. I walked down the road, hitched a lift with a local, and when I tried to tell *him* what had happened, he clearly thought I was crazy…’

He tapered off and sucked his breath in, then let it out in a loud sigh. ‘I caught a train and came back here. I saw my burnt face in the mirror. That made me feel even more frightened and I started drinking to keep the fear at

bay. I didn't know what I should do. I didn't want to tell anyone. The drinking didn't kill the fear and the fear was something else, something living inside me. What I mean is, it seemed *real*. It seemed to be a living presence. I could feel it there beside me, right behind me, something tangible, *physical*… Then I thought about the woman. What had happened to her? She was real, had to be – we spent hours in her car – then both of us, inside the car, were drawn into that spaceship?'

He sucked his breath in again, let it out in another sigh. 'Spaceship? I don't know. I know that sounds crazy… But something – something enormous – came down and opened up and then swallowed us… Unbelievable. Ridiculous. I still can't grasp that it happened. I can't believe it, yet it had to be real… It just had to be; *had* to be.

'So, I stayed here. I had real problems sleeping. I forced myself out every morning, but I couldn't stay out long. I kept imagining things. I always felt I was being followed. I'd come back to the apartment and start drinking again and hear the walls creaking. I was terrified of sleeping. At night, I'd fall asleep anyway. I dreamed that they were coming to get me, but they never materialized.

'I wanted to call you, call my parents or the police, but every time my hand reached for the phone the fear would come back in spades. I think it's going away now. It's still here, but not so bad. I think the booze is finally burning out the fear – maybe just because you're here – but I still feel uneasy. What happened out there? What happened to that woman? I awakened three days later on Dartmoor. I have to know where those days went…'

He stopped talking and blinked a few times, saw the light bulb above him, a dazzling sun, blinding him, making him melt down to his essence. He shook his head and licked his lips, glanced at Jenny, turned away, picked a bottle from the table and poured more wine, letting it splash on his wrist. He had a drink and gasped loudly, as if about to choke, then he shuddered and sank into a chair, facing Jenny's cold gaze.

‘You’re drunk,’ she said.

‘Jesus Christ, is that your answer?’

‘You’re drunk and you’ve been drinking for days and the drink is now talking.’

‘I don’t believe this,’ Richard said.

‘I’m not an idiot,’ Jenny said. ‘What the hell were you doing with that woman in a parked car at night?’

‘*What*?’

‘Your lady friend. Red hair and green eyes. You and some bitch in her car in the middle of Bodmin Moor.’

‘Damn it, Jenny – ’

‘Bodmin Moor, my love? The middle of desolate Bodmin Moor? Do you really expect me to believe that this woman’s car just broke down? Come *on*, love, pull the other leg.’

‘It *didn’t* break down,’ Richard said. ‘That huge flying saucer, or maybe the smaller saucers, made it cut out! Believe me, there was nothing wrong with the car. Those things killed its engine.’

‘Oh, dear God, what a story!’

Richard’s head began to swim, his hands shaking even more, as the logic of her feminine reasoning mocked his pitiful fears. Suddenly he was filled with mirth, an hysterical urge to laugh, bubbling up to his throat and sticking there, almost making him choke. It was just too ridiculous (could she really be jealous?) and he licked his dry lips and blinked repeatedly, trying to keep her in focus.

‘Fuck you,’ she said. ‘That’s why you’ve been drinking. You hitchhike to Cornwall, you get picked up by some tart, you both get drunk and then she makes you an offer that you simply can’t refuse. God, you miserable bastard! What a puritan you must be! You had a bit on the side, a brief fling, and now you just can’t admit it… But UFOs… Oh, Lord!’

She shook her head despairingly, rolled her eyes, crossed her long legs, then gazed around the room with studied interest, as if thinking of other things.

‘It was a UFO,’ Richard said. ‘A big UFO and smaller saucers.’

‘Filled with little green men, no doubt.’

‘Okay, Jenny, fuck it, just forget it. Go to hell. Go on home.’

‘You’re drunk.’

‘So I’m drunk.’

‘You should have tried to stay sober. At least sober you’d have thought of a decent story. Now you know what the wine can do.’

Richard stood up, swaying, the room spinning around him, then he steadied himself and went to the table and poured some more wine.

‘I’m going home,’ Jenny said.

Sighing, she stood up, walked across to the bookshelves, ran her finger through the dust, held it up and ostentatiously studied it. She was attractive standing there, slim and elegant in casual clothes, but he looked at her without feeling his former desire for her, only feeling removed from her. It was odd to feel that way. He felt no desire at all. He then realized that he had not thought once of sex during the whole nightmarish five days. Jenny’s presence had not changed that. He still felt sexually dead. He was ruled by his head, by the fear, and all else had been numbed in him. What *did* he feel?

Nothing outside himself. He no longer felt anything but dread, his ever-present, cold terror. Jenny turned around to face him. She was tense and antagonistic: a pretty girl, someone from his past, with no place in his future… someone talking from faraway.

‘I don’t believe this,’ she said.

‘Neither do I’ Richard said.

‘Did you really think I’d fall for that story? Or is the drink just too much for you?’

Suddenly, Richard felt rage, an unreasonable, brutal hatred, recalling the woman in the car, the flying disks by the windows, the beams of light that shone into her eyes and turned her to stone, his own burnt hands and face… Then he stepped up to Jenny, jerked his shirt collar down, lowered his head and then pointed to his neck with a stained, shaking finger.

‘Look!’ he hissed. ‘*Damn you, look*!’

Jenny was startled by his vehemence, almost pushing him away, her delicate hands flapping loosely in the air and then cupping her face. She glanced briefly at his neck, her brow furrowed, eyes confused, when she saw the livid scar beneath his ear, running under his jawbone.

‘It’s a burn mark,’ she said.

‘Damned right, it’s a burn mark! They shot a beam of light into the car and that’s what it did to me.’

‘Oh, Richard, for God’s sake – ’

He let go of his collar and looked at her with wild eyes, his glass of wine spilling on the floor, further staining the carpet.

‘Fuck it, Jenny, it’s true! Those lights shone into the car. They hypnotized the woman, burned the side of my neck, and then, I swear to God, they did something to the car, took a hold of it somehow, pulled it forward, right into that mother ship. You explain it, Jenny! *You tell me*!’

He was shouting, flushed crimson, a demented gleam in his eyes, those blue eyes that normally were clear and filled with good humor. Jenny stared at him, transfixed, not quite frightened but nervous, seeing someone other than her familiar Richard, some stranger, a possibly threatening presence. At that moment it became too much to bear – the room’s squalor, his uncommon fury and possible dementia – so she pursed her lips and picked up her parka and tried to hide behind a wall of defiance.

‘I don’t *have* to explain it, Richard. I don’t believe it and I won’t listen. I don’t know why you’re acting this way and it has me bewildered. But you’re drunk. You’re talking crazy. I won’t accept this bloody nonsense. When you’re sober you can pick up the phone and give me a call. Now I’m going home.’

Richard stumbled toward her, his hand raised to hurl his glass, but he cracked his shin against the coffee table and dropped the glass and cursed loudly. Jenny stepped back, shocked, staring at him with big eyes, then she shook her head sadly from side to side and hurried out of the room. Richard followed her, enraged, but also shaken by his own violence. He raised his hand and shook his fist wildly as she opened the front door.

‘We’re asleep!’ he shouted after her. ‘*All* of us – we’re asleep! You listen to me, damn it, we’re asleep! We’ll all have to wake up soon!’

He hardly knew what he was shouting, didn’t listen, didn’t care, simply wanting to hear his own voice raging into her silence. The slamming door was his reply – slamming hard: a rebuke – and he cursed and turned back into the room, now horrified by his own performance and shaking even more.

What had happened with Jenny? What the hell had he done? Already the recollection was dreamlike, unreal, slipping out of his reach. The light bulb burned above him, unnaturally bright, mesmerizing, and he blinked and rushed across the room to look down through the windows. He saw Jenny just below him, hurrying along the tarmac path, slinging her parka carelessly across her shoulders as she passed the parked cars. It was dark in the driveway, moonlight filtering through the trees, the fallen leaves drifting around her feet as he walked toward the broken gate. Then she was gone. She had not looked back once. Richard stood there, looking down at the empty darkness, letting the silence embalm him.

Fear. The inexplicable. Dread returned, creeping slyly. Richard found another glass on the table, poured more wine, started drinking. What the hell was he doing? He didn't normally drink this way. It was funny how quickly you got to needing it, how the fear made your throat go dry. Richard drank and paced the room, his hands shaking, gaze restless, seeing shadows, hearing whisperings in his head, sensing alien presences all around him.

Jenny had left. She had departed and he felt dead. This death was not in Jenny's departure, but in something much larger. He had died a week ago. The original Richard had disappeared. The new Richard, a haunted creature, sweaty with fear and confusion, was the matrix of something yet to be formed and prepared for an alien world.

Dread and disbelief. A past rendered obsolescent. He glanced up and saw the burning electric bulb, the rings of light surrounding it. All white. Everything. It had started and ended there. His former history, his structured life, his childish belief in an orderly world, had been shattered in the blinding white haze and would never return. He was sane or he was mad. If he was sane, the world was mad. The most fantastic possibilities now arose and left him feeling defenseless.

Richard went back to the windows, looked up at the stars, and was drawn to the vast sweep of the sky. It had happened: he had lived it. Now he

understood his fear. It was the fear that it might happen again – or that it might not have happened. He couldn't separate the two. The two were one and the same. He dreaded learning what the experience might have meant, but feared his ignorance even more.

And what had he shouted at Jenny? What exactly had he meant? *We're all asleep. We'll all have to wake up soon*… What in God's name did *that* mean? Richard shook his head in wonder. He didn't know what he had meant… Perhaps a belief, possibly just a suspicion, that the fantastic was normal. His farewell. His defiance.

Richard shivered and turned back to face the room. The white telephone gleamed on the table and offered its challenge. Fear. The inexplicable. He couldn't do it: he couldn't talk. He thought of Jenny, of her reaction and her departure, and he knew what it meant. If he talked, they would surely think he was mad. No rational being would accept it. Richard trembled and then felt a great hunger that overrode his concern. He had to get out or collapse. He had to return to sanity. He felt spectral, asexual, drained of life, and he had to defeat that. Trembling again, he shook his head and placed his wine glass on the table. He glanced around the squalid room, heard the silence, felt the fear, then he reached out and picked up the telephone and dialed the police.

Someone spoke.

Faraway.

CHAPTER EIGHT

I retain my contempt. This one emotion is strength. I have needed that strength for many years and will not let it go. What age was I at the time? I think I must have been forty. I still believe it was the explosion over Russia that led to the troubles.

That was 1908. We made a simple mistake. We had a crude form of atomic propulsion and we couldn't control it. So, we had an explosion. The Tunguska region was devastated. The accident frightened the stock company in New York and that started the problem. Some executive panicked, his panic infected the US government, and they were frightened that the project would be exposed and reacted accordingly. They demanded control of our project. Talked of national security. They made a deal with the corporation in New York and placed us under the military.

The military mind is perverse. It destroys all it touches. Once the military took over our project, I knew it was doomed. An immediate conflict of interests. I presented my case and was rejected. I had dreamed of the Atomic Age, of exploration and research, but the military had only one aim, which was national defense. I knew what that meant: they wanted machines for future wars. And though despising them, I nevertheless worked with them to keep my plants open.

The following years were a nightmare. My contempt for the military deepened. A bottomless pit of paperwork, interdepartmental conflicts, interference of the most ignorant kind, then a cutback in funds. All governments are the same. They lumber along like dinosaurs. Shortsighted,

unimaginative, existing only for the moment, they made demands and then cry in protest at the cost, thinking only of votes. Yes, I despise them. That emotion was a luxury. It burned within me all those years and gave me the strength to continue. My contempt lacked morality. But I have never believed in such. Morality, that conceit of free men, is no aid to their progress. So, not moral outrage. No, it wasn't that. My contempt was for the cowardice and ineptitude that hampered my work.

My sole interest was science. My major passion was flight. I was dreaming of a voyage to the stars and their infinite mysteries. This dream was not common. Those fools thought it was madness. I realized that they were draining my brain for their own pointless purposes. And so finally I revolted. Withheld vital information. Over two or three years I sabotaged my own projects, deliberately causing failure after failure, feeling pain for the first time.

Such anguish to endure. The first and last time I felt it. The knowledge that I was destroying my own work to keep it safe for the future. And for all that, I did it. My contempt was my protection. I now knew that the cost of the research had filled them with panic. My great machines would not be built: they would rot while the weapons grew. The men in charge were men moved by mortal fears: they lacked vision and courage. I did not need such men. Such men were a menace. Only heroes or madmen, History's undefiled dreamers, would be capable of backing my vision and making it real.

Thus I sabotaged the project. I said our hopes had been misguided. They stared at me from behind their long table and showed great relief. My apologies were accepted. A few murmured their regrets. Then my atomic propulsion project was aborted and the hangars closed down. World War 1 had already started. The Dark Ages had returned. They wanted aircraft of a functional nature, so I quietly resigned.

The worst years of my life. I was forty-five years old. My genius for technology kept me working, but frustration was choking me. Years of

drifting around the country. Work here, working there. Hiding my genius and displaying mere competence, thus avoiding attention. How did I survive it? With contempt. With willpower. Democracy, that catch-phrase of the West, became something to laugh at. Democracy was incompetence. The right to vote meant poor leadership. What was needed in the world, and what I wanted most desperately, was a government of heroes or madmen who sought the impossible. Such a government did not exist. The US government was run by cowards. Thus for years, with a pain that turned to rage, I kept my dreams to myself.

Years of lacerating anguish. The first and last time. Sustained by relentless curiosity and indomitable will. My contempt for their blindness. My refusal to accept defeat. Every scientific library in the country falling under my scrutiny. All that, plus the work. The demeaning jobs I did for money. My genius for engineering, electronics and aeronautics offered up in the disguise of mere competence as a means of survival. But I used even that. Used laboratories and workshops. Created small things here and there, the minor offshoots of my genius, and sold them to the moguls in suits for the freedom I needed.

Then I found a resting place. The facilities were exceptional. I stayed with an aircraft company in Texas as the head of their research lab. All those nights spent alone. The white sheets of the draftsmen. All the experiments I conducted in secret while designing their aircraft. (My head aches as I think of this. I find it difficult to recall. The prosthetics and artificial heart cannot help me forever.) Electrostatic repulsion. Photosensitive cell steerage. The reaction of streams of ions to furnish rocket propulsion, then a means of neutralizing the decrease of gravity and other such matters. I never cared about their aircraft. Already they were obsolete. Already I had moved beyond orthodox flight and was tackling the mysteries of the boundary layer. The boundary layer was everything. Conquer that and the dream was mine. Thus I worked and theorized, the laboratory, the wind tunnel, but the theories still remained in my papers and could not be tested.

My dream was of evolution. Man's place in the universe. My dream was of Man as a mind that could transcend the body.

Yet how to achieve this? 'Man ' meant individual men. And such men, being imperfect creatures, were distracted by hungers. The hunger for love. For admiration and power. I then tried to understand what such hungers meant and found them all in myself.

The hunger for love. In my loneliness I felt it. Somewhere, sometime, a memory almost gone, I wasted nights trying to ease my own hungers in a more common flesh. What I found was soon lost. The vulva's folds were a threat. The rigid shaft of my penis in a woman gave no more than a spasm. Yet such a spasm shapes the world. People live and die for such. And that spasm represents what most people want: admiration and power.

Learning this, I retreated. Love's deceits showed the way. I understood in my moment of grace that their needs were illusions. I retreated and found myself. I took myself in my own hands. When my need, when my sex, became a threat I gave my semen release. Thus I understood men. They were feelings, not thought. Whereas Man, that outpouring of separate men, held the promise of greatness.

Science represents the mind. It is what we must live by. It is logic and towers above the chaos of outmoded emotions. I learned this and lived by it. I stood above my crude desires. When my flesh seduced my mind from its work, I gave it instant release. A shaft of meat in the hand. The ejaculation of semen. It meant then, and to this day still means, the mere appeasement of hunger. And learning this, I was released. The call of science was in my soul. From then on I neither entered another being nor believe in men's sanctity.

Inhuman? Perhaps. But then what does 'human' mean? Only fear and confusion and doubt and emotional turmoil. To be human is to err. More: to stagnate. Men are impulse encased in flesh and bone, and alone they are nothing. But Man is something different. Man is mind over matter. Man is

imperfection crawling from the slime to evolve into Superman.

I met Goddard in Massachusetts. I remember returning there. I was fifty years old at the time, but felt younger than that.

How I envied Goddard! But envied and pitied him. Another genius humiliated by his countrymen and becoming eccentric. Envy. Admiration. Both share the same bed. And so I envied his achievements, respected them, analyzed them, and felt pity for the future he would have at the hands of his fellows.

It was 1929. I looked upon him as a child. A suspicious, secretive, brilliant child with more instinct than logic. And yet he was a genius. There were things I learnt from Goddard. Not much: just the odd, bizarre insight, some small things I had missed: peculiarities of steering systems, gyroscopic controls, various kinds of self-cooling combustion chambers – small things; all priceless. In return, he learned from me. We worked together for two years. My presence unannounced, Goddard sworn to keep me secret, we spent days in the deserts of New Mexico, unraveling mysteries. Goddard sent his rockets skyward. My soul soared aloft with them. It was 1931, a troubled year, and I knew that my time had come.

Tsiolkovski and Goddard. Both still alive then. One older, one much younger than me, both true pioneers. The basic principles of space-flight: the deaf Russian's great achievement. Then the liquid-fueled rocket of young Goddard, abused beyond mention. Both stood at the threshold. Both failed the same way. Both depended upon 'honorable' men and were thus chained by small minds. Their mistake was not repeated. I did not trust 'honorable' men. What I wanted were heroes or madmen – and the latter sufficed.

I never dwell on morality. Never did, never will. Morality is the crutch of the cripple, the mask of the weak. What of Wernher von Braun? What of Walter Dornberger? Such men were neither sinners nor saints: they were quite simply scientists. Can a scientist think of morals? Should he split peas in a pod? No, what the scientists must do is pursue his great calling. By himself,

he has no means. He must depend on those with power. And in doing so, he must stand aloof from all concepts of right and wrong. I always believed that. I believe it to this day. And gazing out at the wilderness, at the world of snow and ice, I think of how, after working with Goddard, I accepted this bitter truth.

There were madmen back in power. They were obsessed and visionary. To me, they represented the possibility of limitless facilities. I never thought of right or wrong. I simply took my opportunity. I left Goddard and America behind me – and I never returned.

CHAPTER NINE

They drove out of Galveston as the evening fell about them, a fiery sun bathing the Gulf of Mexico in a red, incandescent light. The city soon fell behind them, gave way to parched flatlands, old shacks and houses leaning on stilts, silhouetted in crimson haze. Stanford wiped sweat from his brow: the April winds outside were hot; he swore softly and glanced at Epstein, saw him framed by the sinking sun. Epstein looked extremely tired; he rubbed his eyes and coughed a lot. Stanford grinned at him and then watched the road that cut through the bleak countryside.

‘I had a call from a friend,’ he said. ‘He told me it happened this afternoon. He works in the Manned Spacecraft Center just outside Houston and he wants us to go there at the end of his working day. He said he would talk to us.’

Epstein smiled wearily. ‘You’re such an operator,’ he said. ‘I never imagined I’d get into the MSC, so you’ve just made my day.’

Stanford chuckled at that. ‘Well, you know me, professor. I had this sweet girl and this girl knows this guy and this guy wants what I get from the girl, so he’s very obliging.’

‘You’re a bastard,’ Epstein said.

‘I have a mom and a pa.’

‘You really should settle down, Stanford. You’re too old for that nonsense.’

Stanford chuckled again. ‘I can’t make decisions,’ he said. ‘You told me that a couple of weeks back and I think you were right. I’m an irresponsible sonofabitch. I can’t resist my hard-ons. If it wasn’t for that, I’d have been a proper scientist instead of troubleshooting for your institute. But we all have our place in life.’

Epstein almost laughed, but instead a cough emerged, making him cover his mouth with a handkerchief and spit the phlegm out. When he had finished, he cursed softly, shook his head from side to side, then glanced out the window of the speeding car, his gaze slightly unfocused.

‘You should see a doctor,’ Stanford said.

‘I’m too busy, my friend.’

‘You’ve had that cough a long time.’

‘I’ve been alive a long time.’

‘You’re not so old.’

‘I grow younger every day.’ Epstein studied the bloody sunset in the west, the starkly shadowed flatlands. ‘Where on earth are we going?’

‘Someone’s ranch,’ Stanford said. ‘About halfway between here and Houston. It’s supposed to be just off this road. We should be there real soon.’

‘What sort of rancher?’

‘A struggling one-man band. A few crops and a hundred head of cattle. Now he’s left with only the crops.’

Epstein nodded sympathetically, closed his eyes and put his head back, sinking gratefully into his seat, yearning for sleep. The sun had almost gone, the crimson sky turning to darkness, a ragged ribbon of mountains on the

horizon, suffused in an ochre haze. The wind was growing stronger, howling around the speeding car, clouds of dust racing across the flatlands and whipping the cactus trees.

‘What did you find out about Irving Jacobs?’

‘I thought you were sleeping,’ Stanford said.

‘No,’ Epstein said, ‘I’m just resting. Now what about Irving?’

‘Not a thing,’ Stanford said. ‘The loss of his papers is still a mystery – and that doesn’t help much.’

‘The police?’

‘No papers. They found nothing in Irving’s car. Apparently the only thing that Irving took with him was that fucking pistol.’

‘We checked the terrain,’ Epstein said. ‘That area was definitely radioactive. I think something came down over Irving’s car and made that great circle of scorched earth.’

‘That was one hell of a scorch mark.’

‘Yes, it was huge. But assuming that something descended from the sky, that would explain the lack of tire tracks.’

‘A UFO.’

‘Precisely.’

‘It’s too incredible,’ Stanford said. ‘I just can’t bring myself to accept that. I try, but I can’t.’

‘There were UFOs all over the area. They were all tracked on radar. Three of them – one large and two small – and they were tracked near that area.’

‘I checked on Mary’s info. A lot of what she said was true. Dr Jessup committed suicide, Rene Hardy committed suicide, McDonald drove himself into the desert and shot himself in the head – exactly like Irving. She was also right about Chuck Wakely. He’d been stirring things up a bit. He was shot dead in his room in Miami a couple of weeks back.’

‘I think there’s a connection.’

‘I think you may be right.’

‘And the Philadelphia Experiment?’

‘All the doors are closed tight. The Navy categorically denies that it ever existed… it’s just one of those rumors.’

‘Maybe,’ Epstein said. ‘And then again, maybe not. It’s a known fact that the Navy’s been working for years to develop a form of magnetic cloud that can temporarily render physical objects, including ships, invisible. It’s also widely rumored, though not yet proven, that NASA has been engaged in research into the possibilities of antigravity. Who knows what they’ve accomplished? They keep quiet about a lot of their achievements. But as both of us know, their denials don’t mean a damned thing.’

The sun sank behind the mountains, the blood-red dusk dissolving, the sky starry, the wind howling around the car as it headed toward Houston. Epstein exercised his stiff neck, his hands folded, primly in his lap; he was trying to avoid thinking of Mary or the relentless passage of time. He wasn’t really growing younger. In fact, his age weighed upon him. He glanced out of the speeding car, saw the swirling of clouds of sand, the deepening night stretched out all around them, hybrid with mystery.

‘What do you know about the CIA?’

‘Odds and ends,’ Stanford said.

‘UFO investigations?’

‘They’ve been involved,’ Stanford said. ‘No one really knows how long or how much, but they *have* been involved.’

‘It is possible to check it out?’

‘It wouldn’t be too difficult.’

‘No,’ Epstein said. ‘I mean, check it out in details. I want to know the whole history, from the end of the Second World War to the present day. I want to know when it started. I want to know why. I want to know if their concern was just for national security or if they’re really concerned with something even bigger. I don’t want the usual rumors, the speculations and conspiracy theories; I want the facts straight from the horse’s mouth: the complete, detailed picture.’

‘Why?’ Stanford asked.

‘Because I think the answer’s there. Because too many of those people have come to bad ends after having a lot of trouble with the Establishment, scientific or military. Why was Jessup called to Washington? Why did Ruppelt revise his book? Why did Irving and Dr McDonald both go down the same way? McDonald was harassed and humiliated. Irving had to endure the same. Mary claims that Irving thought he was being followed – and that might well be true. Others have made similar claims. Many retired prematurely or disappeared. So there’s little doubt that investigating UFOs can lead to serious trouble. Does the government know something? Is the CIA involved? If the UFOs exist, and if they’re of extraterrestrial origin, that would certainly put the wind up the government, might frighten the hell out of them. I think the UFOs exist. I also think they’re of extraterrestrial origin. It’s possible that the government thinks the same – or even has firm evidence. That would explain the harassment. It would explain their denials. They might be scared of people getting too close and revealing the truth.’

Stanford shook his head in disagreement. ‘You’re getting carried away,’ he said. ‘You’ve been at this game too many years and it’s all getting through to you. Of *course* the CIA is interested; they’re involved in national security. They’re interested in the UFOs because they don’t know what they are and because any unidentified flying object could be dangerous. It doesn’t matter what UFOs are; what matters is what they *do*. And what they do is cause panic and confusion, distracting pilots and tying up communications every time there’s a sighting. In short, they’re a fucking nuisance. They cost time and a lot of money. If we could identify them positively as atmospheric phenomena, the pilots would no longer be distracted and the phones would stop ringing… Thus the CIA’s interest.’

‘But the CIA has denied that it’s interested.’

‘God, you’re stubborn,’ said Stanford.

Grinning, he rolled his eyes, turned the car off to the right, left the main road in favor of a narrow track that cut obliquely through flat wasteland. The track was rough, filled with potholes, making the car bounce and groan, its headlights almost useless in the dust clouds that swept howling across them. Stanford cursed and slowed down, trying to see through the murk, the moon and stars being blotted out by what seemed like a growing storm.

‘Jesus,’ he said, ‘that’s some wind out.’

Epstein coughed and rubbed his eyes, feeling almost suffocated, aggravated by the howling of the wind and the dense, swirling dust clouds. They were in the middle of nowhere, the storm raging in a void; he caught a glimpse of barbed wire, a gnarled tree, the black hump of a distant hill. The dust seemed to be alive, racing at them and around them, smacking the car and then exploding obliquely and spraying back down upon them. This night had no boundaries, stretching as far as the eye could see, featuring nothing but the billowing clouds of dust and the odd cactus tree.

‘There they are,’ Stanford said.

Epstein squinted into the storm, saw some lights far ahead, rather dull and suspended in space, the dust racing across them. He blinked and looked again, saw the lights coming closer, separating, gliding away from one another until they formed a long line. Epstein strained to see better. The lights were now a lot brighter. The car shuddered and then rolled down an incline and the lights changed again. They were actually raised up on trucks. The trucks surrounded a broad field. The lights were like the lamps of a football stadium, beaming down on the ground below. The whole scene was very strange. Epstein saw the circle of lights, the dust racing across the field, indistinct figures wandering to and fro, some bent over, gesticulating to each other. The sand blew across them, clumps of sagebrush rolled and danced, and the arc lamps formed an immense globe of light surrounded by black night.

Stanford drove up to the field, parked behind one of the trucks, and the lamps threw down a fierce white glare that temporarily blinded them. Epstein closed his eyes briefly, opened them, looked again: he saw the dust boiling through the bright light, around the men walking back and forth. All the men looked odd: they seemed to have no eyes or lips. Epstein shivered and tried to concentrate and then saw the reality. The men were wearing protective goggles, their mouths covered with white filter masks. They were waving at one another and shouting against the wind, bending over the dark, motionless bundles that littered the ground.

‘Here we go,’ Stanford said. He handed Epstein a mask and goggles. ‘Put them on. You’ll need them out there. That stuff could choke you to death.’

Epstein did as he was told, sniffed the mask, felt claustrophobic, then he stared at Stanford through the misted-up goggles and beheld a strange creature. No eyes. No lips. Epstein thought of his UFO reports. There were connections wherever you cared to look and it was best not to think of them. Stanford opened the car door. He pointed ahead and then jumped out. Epstein

opened his own door and slithered out and felt the fist of the wind.

The wind smacked his face, punched his chest, pushed him back; he reached out and grabbed the door of the car and then pulled himself forward. The noise was eerie, bizarre, a constant, tormented howling, the wind-blown sand making a separate hissing sibilance that tortured the eardrums. Epstein felt that he was dreaming: demoniac shapes formed in the murk. A grotesque, faceless creature materialized and reached out to grab hold of him. Epstein was pulled forward. He followed Stanford toward the lights. The dust spiraled over the trucks, around the men in the bright field. Epstein and Stanford approached a truck. A man was kneeling beside it. He was dressed in coveralls, wore the protective mask and goggles, and was studying the intestines of a cow that had been disemboweled.

Stanford waved his right hand, indicating the field illuminated with arc lamps. ‘All dead,’ he said. ‘A hundred head of cattle. All dead. Every last one of them.’

Epstein looked around the field, recognized the dark bundles, the dust settling on blood, bone and tripe, the hides slashed and peeled back. It was a scene of incredible carnage. The wind carried the stench away. The masked men moved back and forth, looking here, looking there, kneeling repeatedly and then standing up again with gloved hands dripping blood. They were using surgical instruments, probing exposed intestines and dismembered limbs, moving to and fro as if in a trance, still not fully believing what they were dealing with. Epstein shivered. It was hot, but he felt cold. He saw the gleam of white bone, a slashed udder, a pool of blood, the wind howling, the dust sweeping over all, trying to bury the horror.

Stanford led him across the field, zigzagging between the dead cattle, skirting around the bulldozer that was roaring into action, passing more blood-soaked men. The cattle were everywhere, scattered over the whole field, some stripped of their hides, their rib cages gleaming dully, throats slashed and udders chopped off, eyeballs torn from their sockets. Epstein had never seen

anything like it – it was a shocking, nightmarish sight. The wind blew the sand over the men, around the trucks and arc lamps.

Stanford walked on ahead, skirting around blood-soaked pits, then turned his head and pointed at a nearby truck, telling Epstein to follow him. Epstein nodded and continued walking. The wind pummeled his body. He put his head down and fought his way forward, trying to see through the hissing, twisting sand. Eventually he reached the truck, went around it and saw a car, a group of men squatting in the narrow space where the wind was less fierce.

Epstein approached this group and knelt down beside Stanford, seeing the tripe on the dusty coveralls, the men minus their masks. These men looked very weary and were drinking from cans of beer. The narrow space between the truck and the car afforded modest protection. Stanford pulled his mask off and Epstein gratefully did the same, then Stanford opened a can of beer, had a drink, wiped his lips and grinned at another man as if they were old friends.

‘Help yourself to a beer,’ this man said. ‘Don’t wait to be asked.’

Stanford grinned boyishly. ‘A fine brew,’ he said. ‘I only come out nights like this on the chance of a free beer.’

‘What the hell are you doing here, Stanford? I thought this was secret. We only got the word an hour ago and we haven’t passed it on.’

Stanford winked at him. ‘An old MSC friend. He gave me the word on the hot line and I just came right over.’

‘He?’

‘Oh, well…’

‘You’ve been poking some cutey.’

‘A man has to give something in return; it’s the least I could do.’

The squatting man grinned and shook his head from side to side. ‘Oh, boy,’ he said, ‘you really are a mover… you’re some scientist, Stanford.’ He spat dust from his mouth, wiped the grime from his eyes, had another slug of beer and glanced around him, shook his head again, slowly. ‘You ever seen anything like this? It’s happening all over the country. Cattle and sheep and sometimes horses: a real butcher’s paradise.’

‘Bless the wind,’ another man said.

‘Yeah,’ said yet another… ‘the stench.’

‘Stanford, you’d better keep your mouth shut; we don’t want this widely discussed.’

Stanford nodded and sipped some beer. ‘That’s understood,’ he said. ‘We had a case like this three months ago; the very same thing.’

‘Where was that?’

‘Lubbock.’

‘I think I remember it.’ The squatting man looked curiously at Epstein. ‘Who’s this?’ he asked.

Epstein felt himself flushing, feeling a little out of place, but he looked the squatting man in the eyes and said, ‘Frederick Epstein.’

‘Who?’

‘Dr Epstein’s from the Aerial Phenomena Investigations Institute in Washington, DC,’ Stanford said. ‘He’s been on a few cases like this before and he doesn’t talk much.’

‘The APII?’ the squatting man said. ‘So why the hell are you interested in this?’

‘Come *on*, Miller!’ Stanford said.

‘Come on, *nothing*,’ Miller retorted. ‘I don’t know what you birds want out there. It’s got nothing to do with you.’

‘Yes, it has,’ Epstein said. ‘As you just said yourself, there’s been a number of cases like this right around the whole country, and invariably they’ve occurred when UFOs have been reported. Cattle mutilation isn’t commonplace, so there might be a connection.’

Miller drank some beer, wiped his lips with his free hand, shook his head wearily from side to side and sighed in despair.

‘I don’t believe this,’ he said. ‘You fucking dogs stop at nothing. The slightest chance to pin something on a UFO and you can’t wait to do it. Well, this has nothing to do with UFOs. There’s no connection at all. What we have here is the work of a gang of rural deviants – or possibly some bizarre religious ritual. It may be sick, but that’s all it is: a gang of headcases on the loose.’

‘I don’t believe that,’ Epstein said.

‘You come from Washington, DC,’ Miller said. ‘You don’t know what some of these country boys are like. The lack of sex drives them crazy.’

Stanford chuckled at that. ‘Not *my* problem,’ he said.

‘No,’ Miller said, ‘not your problem. You’re a clean living city boy.’ He sighed again and stood up, finished off his can of beer, threw the can into the back of the truck and then held up his face mask. ‘We’ve got work to do,’ he said. ‘We have to bury these carcasses. I can’t sit here and talk to you lunatics. Go on home. On your feet, boys.’

The other men cursed and groaned, wearily clambered to their feet, started putting on their face masks and goggles, the dust swirling around them.

Stanford stood up as well, handed his beer can to Epstein, walked up to Miller, tugged his elbow and leaned very close to him, talking into the hissing wind.

‘Just tell me one thing,’ he said quietly. ‘Have you had any UFO reports?’

Miller looked coolly at him, turned away and surveyed the field, his shadow stretching out from his feet, heightened by the bright lights.

‘I don’t know what you’re talking about,’ he said.

Stanford wasn’t smiling. ‘I’m talking about fucking UFOs. I’m wondering what you boys are doing here if what you told me is true.’

‘*What* did I tell you?’

‘You told me this was nothing. You told me it was the work of some crazies. If so, it’s a police case.’

‘We’re burying the bodies,’ Miller said.

‘You work for NASA,’ Stanford said. ‘You work for a decontamination unti and you’ve done this before.’

‘So what’s your bitch? Dead cattle can contaminate. We came out here because we don’t want this mess causing any disease. We’re the nearest available personnel. That’s all there is to it. We got called out because there’s no one else and because we’re equipped. The local health officer called us out. He said he wanted this mess cleaned up. He said it would take too long to get civilians, and he asked us to help. There’s no mystery to it.’

‘Bullshit,’ Stanford said.

‘Suit yourself,’ Miller said.

‘That apartment in Austin,’ Stanford said. ‘It’s booked out from this

moment.’

Miller sighed, shook his head in disgust, walked a little bit away from his men, tugging Stanford along with him. They stood together at the edge of the field, the carnage spread out behind them, the lamps on the trucks beaming down, the sand spiraling and hissing around them.

‘You’ve got a friend in MSC?’

‘That’s right,’ Stanford said.

‘And he’s the one who told you about this?’

‘You’ve hit the nail on the head.’

Miller nodded and rubbed his eyes, the wind tugging at his clothes, the dust sweeping across the flat field and the slumped, bloody cattle.

‘So you’re going to see him.’

‘Right,’ Stanford said.

‘Then presumably he’ll tell you about it and I’ve nothing to lose.’ Miller glanced around, making sure he was out of earshot of his men. Epstein moved closer to him. The wind made it difficult to hear, and Miller spoke softly. ‘There’s a rancher and his daughter. The rancher seems to be in shock. The daughter’s about eighteen years old and she doesn’t seem too bright. The rancher’s still babbling. The daughter doesn’t say much at all. The rancher says he was in the house, having dinner with his daughter, when they heard a humming sound, the whole place went bananas, and a strange light, much brighter than the sun, almost blinded them both. The rancher dived to the floor. He says his daughter just sat there. The light faded and the rancher stood up and grabbed his rifle and rushed outside. At first he saw nothing. Then the humming began again. His daughter joined him on the porch as he looked up, so she looked up as well. There was something over his grazing

land. He's pretty vague about what it was. All we know is that he believes it was huge and that it glowed and climbed slowly. I don't think he's all there. I think they're both a bit nuts. He says the object was as big as the field, that it was silvery and disk-shaped. It hummed and climbed slowly. There were lights right around its rim. It ascended to a hundred feet or so and then it shot off obliquely. His daughter smiles when he mentions it.'

'What about the MSC?'

'They've had radar lock-ons. The blips appeared, then disappeared, kept returning and disappearing, and some jets were sent up to pursue them, but there wasn't a hope. Those unidentifieds were moving fast. They made the jets seem like toys. They were going faster than any aircraft we know of and the jets never saw them. The radar located them here. Same place and same time. We were sent out immediately but when the rancher saw us coming, he jumped in his truck and came out here as well and almost went crazy. And here's what we all found.'

Miller waved his right hand, indicating the floodlit field, the men stooped and working hard in the churned-up dust, the bulldozer roaring, the dead cattle everywhere.

'Are these storms commonplace?' Epstein asked.

'Not at this time of the year.'

'It might be electrical,' Stanford said.

'It might be anything,' Miller said. He waved at the nearby men, told them to get back to work, then he put on his protective mask and goggles, and said, 'Come with me.'

Stanford and Epstein followed him, skirting the edge of the field, both wearing their face masks and goggles, bent against the fierce wind. Miller climbed into a jeep, told them to get in the back, and when they did so, he

shot off down the road, the dust obscuring his headlights. He drove for about five minutes, driving blindly and dangerously, bouncing over potholes and mounds of earth until he came to the ranch. It was badly dilapidated, an overgrown shack on stilts, creaking in the wind and the hissing dust, its lights piercing the darkness.

Miller drove up and braked, killed his headlights and jumped out, waiting for Stanford and Epstein, then walked up to the steps. The house lamps were all lit, framed by shuddering windows, and the light fell from the windows to the porch, illuminating the silent girl. The girl was unkempt, her long hair whipping across her face. She was wearing a cheap cotton dress, her legs and arms were bare, and she stood there with a thumb in her mouth, staring up at the sky.

‘Hello, Emmylou!’ Miller shouted. ‘What are you doing, standing out there? You’re going to choke in the dust!’

The girl moved slowly, turning her head with clear reluctance, as if not wanting the intrusion, gazing down at them, her thumb still in her mouth, her brown eyes uncommonly large. She didn’t say anything, simply studied Miller and Epstein. She glanced at Stanford and her eyes flicked away and then came back toward him. She smiled, the thumb still in her mouth, looking directly at Stanford.

‘Can we come in?’ Miller asked.

The girl blinked and then nodded. The three men mounted the steps to the porch and then stopped by the front door. They are stared at the girl. The howling wind pressed the dress to her body, revealing large breasts and broad hips. The dress had buttons up the front, but the buttons were undone up to her thighs. The dress was being blown back, exposing her legs which were tanned and quite muscular.

Stanford studied her at length. He couldn’t take his eyes off her. She had the

insolence of a child, a sort of lazy sensuality, just standing there and sucking her thumb, staring at him and smiling. Stanford wanted to put it into her. He suddenly saw himself doing it. The lust took him with immediate, startling force and stripped him of commonsense. He shook his head and controlled himself. He was sweating and felt feverish. The girl sucked her thumb, smiling slightly, ambiguously, while stroking the back of the ankle of one bare foot with the toes of the other.

‘You’re the daughter,’ he said.

The girl smiled at him and nodded.

‘We want to talk to you and your father. We want to know what you saw out there.’

The girl was standing only a few feet away. Stanford wanted to touch her. He could scarcely stop himself from doing so. The girl sucked her thumb and stared at him and offered no reply.

‘Can we go inside?’ Miller asked.

The girl nodded dumbly. Miller knocked on the door and then opened it and they followed him in. The house was brightly lit, with oil lamps near the windows, casting shadows on the dusty, plank floor and the makeshift furniture. Stanford stood beside Epstein, the girl inching in behind him. He felt that she was pressing against him and it made him uncomfortable. The shadows fell down flaking walls, crept over handmade wooden chairs. The old rancher was at the table, his hair white, his chin unshaven, a bottle close to his left hand, most of the whiskey gone. Miller touched him on the shoulder, shook him gently, murmured something. The old man raised his head, licked his lips, gazed around him, stared at Miller and went bright red and then reached for the bottle.

‘Not again,’ he growled. ‘No!’

Miller stepped back a little. ‘Just once more,’ he said. ‘Just tell these men what you think you saw. It could be important.’

The old man drank from the bottle, slammed it down and glared at Miller; his eyes were bloodshot and he had the glazed look of someone not in control of himself. He wiped his lips with one hand, the fingers blistered and grimy, flicking whiskey from his lips and then lowering the hand to scratch at his chin. Miller’s shadow fell across him, blotting out half of his face, and he moved out of the shadow and glared at Epstein and then settled on Stanford. The girl was standing behind Stanford. He heard the rustling of her dress. He thought of her dress sticking to her skin, to her hot thighs and soft breasts. Stanford felt very strange, obscurely threatened by the girl, having to force himself not to turn around and stroke her breasts and belly. He couldn’t understand the feeling: it was something more than lust; it was a dream carried in on the wind and now surrounding his being. Stanford felt sick with longing; he had a hard, pulsating erection. He stepped back into the shadows to hide it, but the girl moved back with him. The old man was staring at him, glaring at him, snorting contemptuously, then he glared at Miller and Epstein in turn and started drinking more whiskey. His hand was visibly shaking. He was not as fierce as he looked. He spilled some whiskey down his shirt and then cursed and slammed the bottle back down.

‘I saw nothing,’ he said. ‘Nothing!’

‘*Please*,’ Miller said.

‘Go to hell,’ the old man said.

‘It’s important that you try to remember.’

‘Go to hell. I saw nothing.

The girl moved away from Stanford, slipping quietly through the shadows, pressed herself against the window’s wooden frame and gazed up at the sky.

She wasn’t sucking her thumb: she was biting her tongue and humming distractedly, her belly pressed against the windowpane, her spine arched, her breasts outthrust. Stanford tried not to stare; his eyes were drawn against their will. Shadow and light flickered over the girl, over Miller and Epstein, over the old man who sat at the table and spilled whiskey and cursed.

‘It was silvery,’ Miller prompted.

‘I saw nothing,’ the old man growled.

‘You said it was as big as the field.’

‘Jesus Christ… *Fucking Jesus*!’

The old man kicked his chair back, stood up straight, clutched his head, then let out a terrible anguished scream that lacerated them all. Miller and Epstein stepped back. Stanford glanced at the girl. She smiled and slid her thumb into her mouth, then turned her gaze toward her father. The old man was clutching his head, shaking it wildly and screaming. He suddenly slammed his fist down on the table, swung it back, swept the bottle off. The bottle flew across the room, struck the wall and exploded, the whiskey spraying over Miller and Epstein as they hurried to the front door. Miller pulled the door open. The girl sucked her thumb and hummed. The old man screamed again and grabbed the table and then tipped it over. Epstein followed Miller out. Stanford edged along the wall. The old man grabbed his rifle, swung it wildly around his head, and started sweeping cups and plates off a shelf that ran above the fireplace. Stanford glanced at the girl. She was smiling and humming softly. She was still sucking her thumb and her brown eyes were luminous and teasing. Stanford edged out through the door. The old man screamed and smashed things. Stanford backed into the wind and blowing sand and stumbled down the porch steps. Miller and Epstein were in the jeep, its engine running, the headlights on, and Stanford scrambled into the back, beside Epstein, pouring sweat, his heart pounding. The old man lurched through the doorway, a silhouette in yellow light. He rushed forward and put

his hand against an upright and then glared at the three of them.

‘I saw light!’ he shrieked. ‘*Light*!’

Stanford drove along NASA Highway 1, toward the Manned Spacecraft Center. He felt very strange. He felt terribly alone. Epstein was sitting in the sea right beside him, but he didn’t seem real. Stanford drove fast and recklessly, now ignoring the storm, oppressed by the heat and the noise, obsessed with the girl.

He thought back on what had happened, turned it over in his mind, tried to cast it out and concentrate on his driving, but always returned to the mystery… What had happened back there? What had drawn him to the girl? Was there a connection between the girl’s odd air of distraction and her father’s wild outburst? He recalled the old clutching at his own head, shaking it dementedly from side to side, screaming as if trying to break loose from a terrible anguish. What had actually made him scream? What had made him turn so violent? And what secret did he share with the daughter who sucked her thumb and smiled mindlessly? Stanford tried to think it through. He could only think of the girl. He saw her standing on the porch, in the light from the window, stroking the back of the ankle of one bare foot with the toes of the other. Stanford couldn’t make sense of it. His lust was almost supernatural. It was not based on her breasts and broad thighs, but on her luminous, empty eyes. Stanford felt himself shivering. The howling wind tore at his nerves. He glanced at Epstein, at that lined, bearded face, and wondered what he was thinking.

‘What do you think they saw?’ he asked.

‘I don’t know,’ Epstein said.

‘They sure as hell were acting pretty strange.’

‘Yes, they were,’ Epstein said.

‘I think what they saw affected them.’

‘Yes, no doubt it did.’

‘I mean, I think it might have *physically* affected them.’

‘You think so?’ Epstein said.

Stanford didn’t reply to that. He didn’t know what to say. Looking ahead, he saw more clouds of dust sweeping across the dark road. The storm was fierce and unrelenting, blotting out the moon and stars, the spinning dust forming into shapes that seemed almost alive. Stanford cursed again, whispering. The noise and darkness were getting to him. He thought he saw some lights far ahead and that made him feel better.

‘That looks like it,’ he said.

‘The Manned Spacecraft Center?’

‘Yes,’ Stanford said. ‘Straight ahead. You can’t see much from here.’

Epstein sat up and looked ahead. He thought he saw lights in the distance, but he couldn’t be sure. The dust was everywhere, racing at them and around them, hammering at the car and making it vibrate. Epstein didn’t feel well. He kept thinking of the hundred butchered cattle, the men with faces hidden by masks and goggles. Epstein shivered and coughed and glanced sideways at Stanford; his friend was just a dark form in the night, a faint light in his eyes. Epstein wondered what was wrong: his young friend was too quiet; he sensed a great tension in Stanford and wondered what was causing it. Not the hundred butchered cows. Not the raving old man. Stanford was much tougher than that, was far stronger than he was. Epstein looked again at his friend, heard him murmuring something. He wondered what Stanford was thinking, then he studied the road ahead. He saw the distant lights, shining weakly through the storm, emphasizing the awful desolation of this dark, empty plain.

‘That man, Miller,’ Epstein said. ‘How did you get him to talk. I heard you say something about an apartment. What did you mean by that?’

That finally got a chuckle out of Stanford. ‘God, you’re sharp,’ he said. ‘It’s an apartment that I’ve had for years in Austin, and I let certain friends use it. Miller’s a married man. He’s not a happily married man. I’ve been letting him use the place this past few months for his one great affair. He’s not experienced at that game, so my place is vital to him. He doesn’t want to lose his bit of action, so his tongue started wagging.’

‘That’s blackmail,’ Epstein said.

‘Too true,’ Stanford replied. He chuckled again and looked at the lights ahead and then he started to frown. ‘Jesus Christ,’ he said. ‘What the hell…?’

Epstein looked ahead and saw the lights through the murk. The car was racing toward them, but the lights remained unchanged: the same size, the same distance away, as if actually pacing them. Epstein sat up very straight. Stanford stepped on the gas. The car roared and raced into the storm, heading straight for the lights. Epstein suddenly felt unreal. He bent forward and strained to see. There were twenty or thirty lights, very weak, not too big, spread out at equal distances in a long line that straddled the road. Stanford cursed and gunned the engine, but the distance between the lights and the car remained exactly the same.

‘Godammit, *they’re moving*!’

Stanford almost screamed the words. He kept his eyes on the lights. The car raced into the murk, doing seventy miles an hour, but the distance between it and the lights didn’t alter the least.

‘They’re above the road,’ Epstein said.

‘Damned right!’ Stanford exclaimed. ‘They’re a good hundred feet above the road and they’re definitely *moving*!’

‘How far away do you think they are?’

‘About a quarter mile, I’d say.’

‘Then that line of lights is three hundred feet wide.’

‘Jesus Christ… *Jesus Christ*!’

Stanford put his foot right down and the car leaped ahead, throwing Epstein back into his seat in an untidy heap. He quickly pushed himself back up, heard the howling, whistling wind, saw the lights in the sky far ahead, glowing through the dense dust clouds. Stanford kept driving, his gaze bright and intense; he went all out, but the distance remained the same, the lights luring him on.

Stanford cursed and kept driving. Epstein held on to his seat. The line of lights was dead straight, very wide, and it kept the same distance from them. There was something weird about it. The car was roaring against the wind. The line of lights appeared not to be moving, but it stayed well ahead of them. Then it suddenly stopped. The lights rushed at them and grew larger. They were glowing down through the dense dust, illuminating the road below.

‘*Shit*!’ Stanford snapped.

He slammed his foot on the brake pedal, making the car shriek and skid violently around in a spiraling cloud of dust, almost turning full circle. Epstein’s head hit the windscreen, bounced back into the seat, his hands darting out to press against the dashboard as the car continued skidding around, its rear facing the motionless lights. Stanford cursed and killed the engine, opened his door and jumped out, was pummeled by the wind and dust and saw the lights rising vertically. Epstein followed him out, wiping blood from his forehead, and they stood there, one at each side of the car, looking up disbelievingly.

The long line of lights was rigid and didn’t sway at all. It was not too far away, about two hundred feet up, the separate lights now yellow, red and blue, glowing through the dust storm. The lights rose slowly, making no discernible sound, growing smaller, moving closer together, then finally merging as one. This one light was long and thin, a shimmering blade of pure whiteness, and it shrank until it looked like a glowing sphere. The glowing sphere slowly climbed above the storm and disappeared in the black sky.

Stanford and Epstein were stunned, glancing wide-eyed at one another. They stood there for a long time, staring up at the sky. Eventually, being pummeled by wind and dust, they went back to the car.

‘Where are we?’ Epstein asked.

‘About a mile from the MSC. I thought that thing was heading straight for it, about to crash into it.’

‘It was low enough,’ Epstein said.

‘Damned right, it was low enough. It was low enough and big enough to level the MSC to the ground.’

‘They must have seen it,’ Epstein said.

‘They couldn’t have missed it,’ Stanford said. ‘Let’s go. I want to find out what’s happening. Those bastards can’t deny this one.’

Stanford drove more carefully now, feeling disorientated, his nerves flayed by the wind and the dust and the night’s weird events. He thought of the girl on the porch, of her luminous, empty eyes, of her firm breasts and naked brown thighs, her belly pressed to the windowsill. His lust returned immediately, a primitive, unreasoning hunger, and he shook his head and tried to think of something else: the old man’s sudden violence… What had descended over the field? Just what had the old man seen? Stanford tried to think it through and failed dismally, his lust growing and blinding him.

Epstein remained silent, feeling stunned and exhilarated, thinking of the vertically climbing lights and their serene, silent beauty. It all seemed fantastic. The whole evening was like a dream. He felt slightly dizzy, coughed a lot and rubbed his eyes, exhausted and excited at once, his heart pounding dramatically. It was his first UFO sighting and it had filled him with awe. He thought of the butchered cattle, of the old man screaming '*Light*!', and then he wondered if what he had just seen had also materialized over the grazing field.

The storm was almost unnatural and certainly unprecedented; it had emerged from a placid, crimson dusk and showed no sign of abating. Epstein thought of the ascending lights – that line of lights that never swayed – and wondered what kind of object it was that could fly in this storm.

Glancing ahead, Epstein saw another line of lights, slightly obscured behind the dense clouds of dust, hanging dimly in darkness. He rubbed his eyes and looked again, feeling decidedly odd. The lights grew larger and illuminated a fence and a wide metal gate. It was the Manned Spacecraft Center. The lights shone from white buildings. Epstein sighed with relief and then coughed and wiped his lips with a handkerchief.

Stanford drew up to the gate and stopped the car as a guard came toward them. The guard was stooped against the wind, pressing his cap to his head, the dust swirling around him and beating at him, covering his uniform. When Stanford rolled his window down, the dust roared in through the car. The guard's masked face appeared at the open window, his eyes hidden by goggles.

'Dr Stanford!' Stanford shouted, showing the guard his official MSC pass. 'This here's Professor Epstein! We have an appointment with Captain Armstrong of the Space Science and Technology Administrative Office!'

'I'm sorry, sir,' the guard said. 'All appointments have been cancelled. We're in the middle of a special security exercise and no one's allowed in.'

‘You don’t understand, corporal… I repeat: We have an *appointment*.’

‘And I repeat, sir: All appointments have been cancelled. You’ll have to leave now.’

Stanford looked past the guard, saw the closed gate and high fences, the roads between the buildings packed with troops, all heavily armed.

‘A *security* exercise?’

‘That’s right, sir. Just routine.’

‘That’s an awful lot of men for a routine security exercise. And they’re all heavily armed. What the hell’s going on here?’

The guard’s face was impassive. ‘I’m sorry, sir. You’ll have to leave.’

‘Listen, corporal, we have a *serious* appointment. Now get on that telephone.’

The corporal straightened up, waved his hand at the guard’s box, and another man, a sergeant, walked out, armed with a rifle.

‘What’s up?’ he asked.

‘We have an appointment,’ Stanford said.

‘All appointments have been cancelled,’ the sergeant told him. ‘You’re not allowed in.’

Stanford looked past the sergeant, past the fence, into the complex, saw the troops lined along the linear roads, all studying the sky.

‘Sergeant,’ he said, sounding calmer than he felt, ‘we just saw some very strange lights straddling the road about a mile or so back. They were moving, and then, when we approached them, they climbed vertically– climbed so slowly we couldn’t believe it - then they simply vanished. Any idea what

they were?’

‘Probably just a helicopter, sir.’

‘Too big to be a helicopter, sergeant. Try something else.’

‘I don’t know, sir.’

‘You should have seen them from here, sergeant.’

‘No, sir, we didn’t.’

‘You couldn’t have possibly missed them, sergeant; they formed a very long line.’

‘We haven’t seen anything.’

‘Why are your men scanning the sky, sergeant?’

‘They’re looking for helicopters, sir. It’s a security exercise. They’ve been tasked with reporting the helicopters as soon as they see them.’

‘You have helicopters up there in this storm?’

‘That’s right, sir.’

‘You think helicopters can fly in this weather?’

‘Yes, sir. I suppose so.’

‘And you’re not going to report the lights we saw?’

‘We haven’t seen any lights, sir. Now please leave the area.’

Stanford nodded, studied the soldiers behind the fence, saw them all staring up at the night sky.

‘Sergeant, please get on that telephone and inform Captain Armstrong that we’re here.’

‘I’m sorry, sir. I can’t do that.’

‘What the hell do you mean, you can’t do it?’

‘Captain Armstrong isn’t here, sir. No administrative personnel are allowed in until the end of the exercise.’

‘But he *told* us to meet him here!’

‘That was probably before he knew about this exercise. He’s not here right now, sir.’

‘Sergeant, we only spoke two hours ago.’

‘Sorry, sir.’

‘You mean you pulled this security exercise without giving anyone any notice?’

‘Please, sir, you’ll really have to leave now.’

The sergeant straightened up and held the rifle across his chest, squinting down through the dense sand, unprotected by goggles. Stanford glared at him, unwilling to move, then the corporal placed his right hand on his pistol and reached for the door handle. Stanford noticed the gesture, cursed softly and shook his head, then he turned on the ignition, reversed the car sharply, and headed back along NASA Highway 1, cutting a swathe through the storm.

‘*Godammit*!’ he exclaimed. ‘What the *hell’s* going on? Those bastards were lying through their teeth. They know something is up there.’

‘They were certainly scanning the sky,’ Epstein said.

‘Damned right,’ Stanford said. ‘They’ve seen something up there and now they’ve locked the fucking gates and they’ve got that placed looking like a war zone. And now Armstrong… Oh, *Jesus*!’

He smacked the steering wheel with one hand, shaking his head in frustration, and glanced at Epstein with a dangerous gleam in his eyes.

‘Where are we going?’ Epstein asked.

‘Clear Lake,’ Stanford said. ‘Armstrong lives in Nassau Bay and I’m pretty sure he’s hiding out there right now. I want to talk to that bastard.’

Epstein sank back into his seat and closed his eyes, his exuberance giving way to exhaustion. The car roared and vibrated, pummeled constantly by the storm, and Epstein floated in a weird, light-flecked darkness, now removed from himself. He saw the long line of lights, rising slowly and silently, floating up through the wind and dust with an awe-inspiring majesty. Then he visualised the rancher’s field, the same lights descending quietly, the cattle bellowing in panic and confusion as the dust beat about them… What had happened after that? What had caused the terrible carnage? Indeed, had anything descended at all or had the rancher imagined it…? Epstein coughed and wiped his lips, opened his eyes and surveyed the storm. Clouds of dust swept around the speeding car and raced across the dark flatlands.

‘It’s not like Armstrong,’ Stanford said. ‘I’ve known that guy for years. He’s been passing me information for years, and he’s always been reliable. He told me to meet him there. He’s never missed an appointment. If that was just a security exercise, he’d certainly have known about it and wouldn’t have sent us out there in the first place. Those soldiers are looking for something. They sealed that place off at the last moment. They must have sealed it off just after Armstrong called me, and there must be a reason for that. Armstrong said he had something to tell me. That usually means unidentifieds. I think those soldiers in the MSC and the NASA decontamination team are part and

parcel of the very same thing. There's something over this area.'

He slowed the car down, pointing his finger at murky lights, turning into the sleepy suburb of Nassau Bay and cruising along its empty streets. There were lights on in the houses, silhouettes framed by windows, the lights beaming out and falling on neat lawns, the shrubbery bent by the wind. Stanford cruised for some time, studying the left side of the road, straining to see through the clouds of dust and muttering under his breath.

'That's it,' he said eventually, pulling over to the right, stopping the car on a gravel drive that fronted a chalet-styled charcoal-brown house. He killed the engine and switched the lights off, opened the door and slipped out; Epstein followed him and joined him on the porch as he was pressing the doorbell. They heard the sounds of revelry inside, a lot of laughing and shouting. Stanford pressed the bell again, looking angry and impatient. The man who opened the door was flushed with alcohol, his bloodshot eyes blinking and settling on Stanford, opening wide with surprise. Her had a half finished drink in his right hand.

'Oh, Christ!' he said softly.

'We had an appointment,' Stanford said.

The man seemed reluctant to open the door farther, his shoulder leaning against it.

'Get out of here,' he said.

'Let us in,' Stanford said.

'I can't talk to you, Stanford. Go away. I've got people in here.'

'Your buddies from the MSC?'

'That's right,' Armstrong said. 'It's a private party, Stanford. I can't talk

now. Just get the hell out of here.' He started to shut the door, but Stanford stopped it with his foot.

'We've come a long way,' he said. 'We came just to see you. You said you had something to tell us – now you're slamming the door. What the hell's going on?'

'Nothing,' Armstrong said.

'Then let us in,' Stanford repeated.

'I can't,' Armstrong said. 'It's a private party. For Christ's sake, get out of here.'

'I love parties,' Stanford said.

'You can't come in, Stanford.'

'Why not? What the hell are you worried about? I've been in there before.'

'You know damned well why not.'

'You brought us out here,' Stanford said.

'I said I'd meet you at the MSC.'

'You weren't there,' Stanford said.

A burst of laughter from inside, more shouting, someone singing. Armstrong glanced nervously over his shoulder, then looked back at Stanford.

'Godammit,' he said.

'What's going on, Armstrong. How come you suddenly throw a private party instead of meeting us as planned?'

‘It just happened,’ Armstrong said.

‘That’s bullshit,’ Stanford said. ‘You threw that party because you didn’t want us to come here and find you alone. You don’t want to talk. You’re frightened of something. You were going to tell me something and now you’re scared shitless. I want to know why.’

‘I’ll give you a call,’ Armstrong said.

‘I don’t want a goddamned call. I’m not leaving here until I know what’s happening, so you’d better start talking.’

‘Give me a break, for Christ’s sake!’

‘Why?’ Stanford said.

‘I’ve got the CIA on my back.’

‘We’re coming in,’ Stanford said.

He started to push his way in, but Armstrong resisted him, glancing nervously back into the house and wiping his lips with a jittery hand. Then he looked back at Stanford. ‘Okay, *okay*!’ he whispered, stepping outside and closing the door behind him. He was a small man, potbellied, his hair thinning and turning gray; he glanced back over his shoulder, at the closed door behind him, then he turned reluctantly into the howling wind and spoke directly to Stanford.

‘This is the last time,’ he said. ‘I won’t talk anymore. Don’t ask me why – I won’t tell you – but this is the last time.’

‘You mentioned the CIA.’

‘No, I didn’t,’ Armstrong said. ‘Remember that: I didn’t say a word. I didn’t mention the CIA.’

‘Okay,’ Stanford said, ‘I never heard it.’

‘Good,’ Armstrong said. ‘Now listen carefully to the rest of this and don’t ever forget it. You don’t call me anymore. You understand that, Stanford? What I say to you tonight is the end. I’ll only talk on those terms.’

‘Christ, Armstrong, we’re old friends!’

‘Shut up. There’s something else… This conversation never happened. The last time we talked was on the phone, a couple of hours ago. We haven’t spoken since then. We never had this meeting.’

They stood facing one another, the dust sweeping across between them, the wind shaking the wooden railings of the porch. Epstein said nothing, feeling embarrassed and guilty, ashamed of his complicity in this bullying, avoiding Armstrong’s frightened eyes.

‘It’s a deal,’ Stanford said.

‘Okay,’ Armstrong said. He licked his lips and nodded, glancing nervously left and right, ascertaining that there was no one else on the porch, seeing only the swirling dust. He was still holding his drink, a half empty glass of bourbon, and he finished it off and wiped his lips and looked directly at Stanford.

‘There’s a flap on,’ he said. ‘It’s a very big flap. In fact, it’s the biggest flap we’ve ever had and that place is bananas. It all started about three hours ago. We received some calls from our pilots. They reported seeing unidentifieds over the Gulf of Mexico, traveling in a northerly direction at incredible speeds. These objects were silvery lights. The pilots refused to comment further. The sightings occurred an hour before sunset and continued till darkness. Meanwhile, we were getting radar lock-ons. These lock-ons located the unidentifieds not over the Gulf of Mexico, but over a local farmer’s ranch. According to the radar, something enormous had come from the

direction of the Gulf of Mexico, circled around at forty thousand feet over the Manned Spacecraft Center, and then descended as three separate blips over the ranch. These objects went off the scopes when they entered the radar's ground clutter.'

Armstrong glanced about him, left and right along the porch, his gaze wandering to the far side of the street as if searching for someone. There was no one in the street. The storm was keeping them all inside. Armstrong spat dust from his mouth and rubbed his eyes and then squinted at Stanford.

'We were going to scramble some jets,' he said, 'but just as we gave the order this dust storm blew up out of nowhere. That effectively grounded the jets – the winds over the airstrip were incredible – but we still kept getting lots of unidentifieds. These reports were coming in by telephone from other radar stations located at White Sands, Los Alamos and the whole Gulf of Mexico area – and then, according to our own radar readings, the unidentifieds were suddenly right above us. Naturally, because of the dust storm, we still couldn't scramble the jets, so we just had to sit there and tear our hair out. Then, about half an hour before I called you, the three objects above the ranch reappeared on the radarscopes, merged until they became one, and this single, much bigger object started flying toward the Manned Spacecraft Center, doing no more than thirty miles an hour.'

'*Thirty* miles an hour?'

'That's what I said.'

'That's impossible.'

'You bet.'

'And it wasn't just a weather balloon, being blown horizontally by the storm?'

'No, Stanford, it wasn't.'

The sounds of the party continued inside, growing louder each minute. Armstrong listened at the door, nodded his head in satisfaction, then glanced again along the porch, his bloodshot eyes shifting nervously.

‘We all went outside,’ he said. ‘We observed this thing flying over us. It was flying above the storm, but it was pitch black out there, so all we could see were its lights. The lights were multicolored and formed a perfect circle. They were hazy in the darkness. There were no visible features to measure them against, but that circle of lights looked enormous… The object must have been a few hundred feet up, but it *still* looked enormous… It just glided right over us, hardly moving at all, then it went off in an easterly direction and its lights abruptly blinked out. When we went back inside, there were unidentifieds all over the radarscopes.’

Taking a deep breath, Armstrong gazed up at the sky to see nothing but a curtain of dust. He shook his head disbelievingly from side to side and started talking again.

‘Shortly after that sighting we received a call from the local sheriff, telling us to get out to the ranch. Bearing in mind what we had seen, we complied immediately and soon received a phone call from our boys. No need to recount the message – you’ve already been out there – but when our boys found out what was happening, the MSC intelligence promptly ordered us all off the base. Naturally, we were furious. We wanted to know what was going on. What we were told was that we hadn’t seen or heard anything, that loose talk could lead to trouble for us, and that we were to go to our homes and remain there until further notice. That’s why we’re all here. That’s why I can’t talk to you again. What happened out there is unprecedented – and we’re all pretty scared.’

‘The CIA?’

‘I didn’t say that.’

‘Right. You didn’t say it. Just tell me about that field of gutted cattle. Where does that fit in?’

‘I don’t know,’ Armstrong said. ‘Swear to God, I don’t know. All I know is that it’s happened before – all over the country.’

‘One of your men said it was a bunch of local crazies, but I can’t really buy that.’

‘One final thing, Stanford, and that’s it… I won’t talk anymore.’

‘Okay, one last thing.’

‘It wasn’t a bunch of local crazies. That wasn’t amateurish butchery. Whatever the reason for the butchery, it was done with a frightening efficiency. Those animals were killed with an unknown nerve gas, they were sliced up with tools that must have been razor-sharp; and their tongues and their eyes, their genitals and their udders, were removed with a surgical precision and then spirited away. Don’t ask me why. It doesn’t make any sense to me. But those animals were slaughtered by a bunch of nutters – they were professionally butchered.’

‘The decontamination unit?’

‘The area’s radioactive. That’s why coyotes and buzzards won’t touch the carcasses. It’s always the same.’

‘The old rancher and his daughter?’

‘That’s as far as I go, Stanford. That’s it. I’m not saying another damned word. Don’t ever call me again.’

Armstrong opened the door, started into the house, hesitated, and then turned back to face them, his gaze fixed on Stanford.

‘We’re old friends,’ he said, ‘so I’ll give you some advice. Don’t go back to that ranch. I warn you, don’t be tempted. Whatever you do, don’t go back there. It’s not worth the trouble.’

He stepped into the house and slammed the door shut. Stanford stood there, his gaze fixed on the closed door, then he turned to Epstein, shrugged his shoulders, shook his head, stepped down to the dark gravel driveway and walked back to his car. Epstein followed him automatically, feeling dazed and exhausted, fighting against the howling wind and dust, wondering how this would end. Once in the car, he stared at Stanford, now pale and too tense. Stanford angrily started the car, drove out into the road, and turned back the way they had come, looking determined.

‘I’m going back there,’ he said.

‘To the MSC?’ Epstein asked.

‘No,’ Stanford said. ‘To the ranch.’

‘Oh, my God,’ Epstein murmured.

He put his head back on the seat, closed his eyes and welcomed the darkness, silently cursing the wind and the dust and the night’s teeming mysteries. He kept his eyes closed, refusing to look outside the car, letting the anger take hold of him and shake him back to wakefulness. He then thought of the butchered cattle, of the old rancher and his daughter, of the lights in the sky and the guards at the MSC, of Armstrong’s reluctance to talk and Stanford’s subsequent fury. Something odd was definitely happening. It was causing widespread panic and confusion. He and Stanford had been lied to, locked out and warned off; the events of the night were being suppressed and that meant they were real.

Epstein coughed and muttered an oath, opened his eyes to look at Stanford, saw his profile silhouetted in the window, the storm raging beyond him.

Stanford's normal good humor had finally deserted him. He had never looked so cold. The wind and dust were pummeling the car, but he just kept on driving.

Eventually, they turned off the road, went along the familiar track, passed the flatlands that stretched into the darkness on both sides, and stopped near the crest of the hill that led down to the ranch. Stanford killed his headlights and they both stared straight ahead. A ghostly light formed a huge fan in the sky beyond the crest of the hill.

'What the hell…?' Stanford said.

After glancing quizzically at Epstein, he opened his door and slipped out, letting the wind sweep the dust through the car. Epstein coughed to clear his throat, covering his eyes with his hands, then he followed Stanford out of the car, into the storm's awful fury.

The storm seemed to be worse than ever, much louder, more violent, the dust lashing their faces with remarkable strength. They had to force themselves forward, shielding their eyes with their hands, stooped over as if pushing against a wall, being pummeled from side to side. Epstein felt suffocated, dazed, slightly frightened; he saw Stanford on the hill, his clothes flapping about him, silhouetted in the large fan of light that split the darkness ahead. Epstein struggled up to him, reached out to grab his shoulder, and they stood there, neither saying a word, looking down on the ranch.

The area surrounding the ranch was floodlit, filled with trucks and armed troopers, some of the soldiers wearing protective masks and goggles, staring up at the sky. Other soldiers were hard at work, crouched low and gesticulating, hammering posts into the ground and running barbed wire along them, erecting a fence that ran right around the ranch in an enormous rectangle. The lights in the ranch were on. The wind howled and hurled sand over all and made the whole scene unreal.

‘Jesus Christ!’ Stanford said. ‘Do you see that? They’re being fenced in!’

‘Damn them,’ Epstein responded, surprised by the extent of his own rage. ‘They won’t get away with this.’

‘They’re carrying weapons and scanning the sky,’ Stanford said. ‘They must be looking for *something*.’

Epstein suddenly exploded, his throttled anger breaking loose; he smacked the palm of one hand with his fist and turned back to the car. The wind lashed him, tugged at him, tried to throw him to the ground, as he cursed and shouted against the storm.

‘Damn them!’ he shouted. ‘They won’t get away with this! We’ve been given the runaround too often, but the buck stops right here. I want to know about this, Stanford! I want to know about *all* of it! I want the Air Force checked out. I want the facts on the CIA. I want to know what’s been happening all these years and why they’re keeping it secret. The Air Force say they’re not involved. The CIA say the same. They’re both lying and now we have the proof, so let’s find out the truth. You understand, Stanford? It’s time to stop playing around! I want to know what’s been going on, I want the facts, not their fiction, and I want to take those facts and break them down and tear this whole thing apart!’

He stopped shouting and stared at Stanford. His friend was gazing up at the sky. Epstein suddenly realized that it was quiet, that the fierce wind was dying. Startled, he looked around him: the billowing sand was settling down, spiraling gently, drifting languidly on all sides in the stark, abrupt silence. Epstein couldn’t believe it. He looked up at the sky. He saw the dust clouds thinning out, the moon and stars reappearing, the soft moonlight illuminating the flatlands and the parched, shivering trees.

Epstein stared down at the ranch. The dust no longer obscured the porch. The girl was standing there and sucking her thumb, gazing up at the sky.

Everyone was gazing up. The soldiers had switched off the floodlights. They were standing around the house, clearly visible in the moonlight, neither moving nor making a sound, just staring up at the night sky.

‘There they go,’ Stanford said.

Epstein followed Stanford’s gaze. He saw the three lights in the sky. They were very high up, very small, very bright, one of them the size of a dime, the other two even smaller. Epstein observed them, mesmerized. He felt Stanford’s presence beside him. The lights formed a perfect triangle, climbing vertically, moving slowly, each composed of a luminous outer layer that surrounded a darker core. Epstein felt his heart pounding. He couldn’t tear his eyes away. The two smaller lights changed, glowing brighter, accelerating, then they raced with a silent, serene grace toward the large light above them. The three lights merged together, became one, a brilliant star, then the star flared up and shot off to the south and disappeared almost instantly.

Stanford looked down at the ranch. He saw the girl on the porch. She was bathed in the moonlight, her dress fluttering against her legs, her feet bare, her thumb still in her mouth, her eyes fixed on the sky. Then she turned in his direction. She appeared to be staring directly at him. Stanford shivered and looked at Epstein, shivered again and shook his head, then they both returned silently to the car and headed back toward Galveston.

‘I’ll find out,’ Stanford said.

CHAPTER TEN

Richard sat up straight in the hard wooden chair and stared nervously at the window beyond the desk. The desk was long and solid, its surface badly scarred, supporting a telephone and a couple of empty trays, all covered in dust. The window was equally dusty, one of its panes badly cracked, now vibrating from the traffic that inched along Tottenham Court Road, London. Richard sat there for five minutes. It seemed longer than that. He was still studying the window, watching the rain splash on the glass, when the door behind him suddenly opened and then slammed shut.

Richard jerked his head around, but the two men were already past him, moving around him and taking chairs behind the desk. They were middle-aged, one with black hair, the other bald, both wearing nondescript suits, shirts and ties, both with briefcases. The bald-headed man smiled at Richard, then opened his briefcase and removed some papers; he placed the papers fastidiously on the desk and then unclipped a ballpoint pen.

‘Awful weather,’ he said.

The other man seemed humorless, patting his hair with restless fingers, opening his briefcase and withdrawing a tape-recorder, which he set down before him. Only then did he look at Richard, his dark eyes expressionless, face sallow, chin badly shaved, now tapping the table with those same restless fingers.

‘Feeling all right?’ The bald-headed man asked.

‘Uh?’ Richard grunted.

‘I said, are you feeling all right? You seem rather tired.’

‘Yes, I’m tired,’ Richard confessed. ‘I’ve had very little sleep. I came yesterday to report seeing a UFO – and I’ve been here all night.’

‘Sorry about that,’ the bald-headed man said. ‘Must have been a bit uncomfortable. But the police can’t touch cases like this – they always have to call us.’

‘Who are you?’ Richard asked.

‘Data processors,’ the man replied. ‘We specialize in aeronautical phenomena and we work for the government.’

‘What department?’ Richard asked.

‘I don’t think that’s important. We’re just here to assess what you think you saw and write it up for the record.’

‘What I *think* I saw?’

‘Please don’t be offended. I’m not trying to insult you. But the sky is not as simple as it seems and it plays tricks with people.’

‘Such as?’

‘St. Elmo’s fire can turn a perfectly normal airplane into a bright, multicolored halo of twisting light. The planet Venus, when viewed under certain conditions, will appear as a glowing orb that moves in the most extraordinary patterns. Comets, meteors, balloons, satellites, flares, fireworks, noctilucent clouds, plasmoids and corona discharges can all look like bright, solid objects. For instance, a high altitude balloon, if struck at a low angle the rays of the setting sun, will resemble an enormous flying disk flying at

tremendous speed. What will appear to the observer to be the blazing exhaust of the disk will actually be the swirl of dust and ice crystals left in the wake of the balloon and also reflecting the sunlight. Likewise with temperature inversions. These are various layers of air, all at different temperatures, which bend and twist and generally distort rays of light to create what is best termed a mirage. Did you know that a temperature layer can pick out a boat at sea, project it as a mirage in the sky, and that mirage will be viewed by an experienced pilot as a long, dark shape filled with illuminated windows? Similarly, somewhere in the country a long line of cars may be crawling up a hill, all beaming their headlights into the night sky; given the right kind of temperature inversion, those lights will be bent and sent traveling, will bounce off another temperature inversion thirty or forty miles away, and will appear to the observers as a mass of glowing, disk-shaped objects, all flying in perfect formation across the sky. As for plasmoids and ball lightning, both are basically formed by electrified gas that when burning brightly oscillates, vibrates, wobbles, flies horizontally, climbs vertically, glows in blue and red colors, and can look like a sphere or a disk or a gigantic torpedo; they also hum and make other strange sounds and are very impressive… Shall I continue?'

'No,' Richard said.

'Good.'

'I didn't see any of those things.'

'Possibly not. Let's find out.'

The bald man smiled pleasantly and sat back in his chair, tapping his teeth with his ballpoint pen and nodding his head. The black-haired man lean forward, resting one hand on his tape-recorder, not smiling, speaking in clipped, measured rhythms, his dark eyes fixed on Richard.

'The following questions have been designed to give the government as much

information as possible concerning the unidentified aerial phenomenon that you've reported. Please try to answer the questions as accurately as possible. The information you give will be used for research purposes and will be regarded as confidential material. Your name will not be used in connection with any statements, conclusions or publications without your permission. Now please confirm that you understand and accept this.'

'I do,' Richard said.

The bald man moved his chair forward, leaning over the desk, his pen hovering just above his notepaper, preparing to write. The other man turned his tape-recorder on and then started the questioning.

'When did you see the object?'

'March seven.'

'1974?'

'Yes.'

'Time?'

'About thirty after eight.'

'In the evening?'

'Yes.'

The bald man was making annotations in a large, heavily lined form, filling in the blank spaces.

'Where were you when you first saw the object?'

'In a car.'

‘Location?’

‘Cornwall.’

‘Precisely.’

‘The A30 through Bodmin Moor. It was near King Arthur’s Hall. That’s between Bolventor and Bodmin. That’s all I can tell you.’

‘How long did you see the object?’

‘Pardon?’

‘The duration of the sighting.’

‘I dunno. A good five minutes, I think. I blanked out after that.’

‘You’re certain you saw it that long?’

‘I’m not certain of anything.’

‘Five minutes is a long time.’

‘A lot of things were happening. They couldn’t have taken place in under five minutes; it must have been at least that.’

‘What was the condition of the sky?’

‘I don’t know what you mean.’

‘Bright daylight? Dull daylight? Bright twilight? Just a trace of daylight? No trace of daylight? Don’t remember…?’

‘Deepening twilight. A vivid red sky. The sun was just sinking.’

‘Where was the sun located as you looked at the object?’

‘I don’t know. I can’t remember… Yes, it was behind the object. In fact, at first I thought the object was the sun. I thought the sun was exploding.’

‘It eclipsed the sun?’

‘Yes.’

‘What else did you notice concerning the sky?’

‘Sorry?’

‘The stars… None? A few? A lot? Can’t remember…?’

‘I can’t remember. There was just this silvery haze. I don’t think I saw stars.’

‘And the moon?’

‘I didn’t see it. There was just the silvery haze, then this faded and I saw the object. This object was so big, it seemed to block out the whole sky.’

‘The object was brighter than the background of the sky?’

‘Yes, it was at first. It was the brightest thing I’d ever seen. Then it darkened and lights flashed all around it and it blotted out the sky.’

‘How dark was the dark shape?’

‘I don’t know what you mean.’

‘Was it darker than the sky at that time?’

‘The sky was a vivid red. The object was dark.’

‘Did the object appear to stand still at any time?’

‘It came up over the rocks and then stopped, just hovering there in mid-air.’

‘Did it speed up and race away at any time?’

‘No, it just stayed there. It was enormous and it stayed there. It just hung there in the sky and then dropped lower and then opened up and we were – ’

‘Did it break up into separate parts or did it explode?’

‘Those questions are ridiculous. What happened was – ’

‘Please just answer the questions.’

‘No, it didn’t explode. It didn’t break up either. These panels opened and two other disks flew out and – ’

‘Did the object give off any smoke?’

‘There were *three* objects!’

‘Did the largest object give off any smoke?’

‘No, not that I noticed.’

‘The smaller objects?’

‘No. Definitely not.’

‘Why definite?’

‘They were close. They were right outside the car, one on either side of the car. They just drifted around the car, real slow, and I didn’t see smoke.’

‘Did any of the objects change shape?’

‘No. I mean, I’m not too sure of that. When I first saw the large object, it just looked like a light – a very bright explosion of light that filled the whole area. Then it changed to the dark shape. There were flashing lights all around it. I

kept thinking it was changing its shape, but I think the lights made it look that way. It didn't change as it rested there.'

'Rested? On what?'

'It was just floating in the air.'

'How high up?'

'I don't know. It seemed about a hundred feet or so, but I can't be too sure of that. Then it descended. It dropped almost to ground level. That's when it opened up along the bottom and then drew us toward it.'

'Did the object flicker, throb or pulsate?'

'It was just a sudden flaring light that faded away and was replaced by the dark shape.'

'You mentioned various lights.'

'That's right. Colored lights. They were red, blue, green and orange, they stretched the whole length of the object, and they blinked on and off in sequence, from left to right, then right to left, flickering on and off very fast, almost turning into one rainbow color.'

'Where were the lights positioned?'

'I'm not sure about that. I think they were near the bottom of that thing. They may have gone right around it.'

'You mean the object could have been circular? Disk-shaped?

'Yes. Like the smaller objects. They were certainly disk-shaped.'

'Did the large object move in front of anything at any time?'

‘I told you: the sun.’

‘Anything closer?’

‘It came over the nearby rocks and stopped in front of them. It just blotted them out.’

‘Rocks?’

‘The Neolithic stones.’

‘Did it move *behind* anything at any time?’

‘No.’

‘Did the object appear to be solid or transparent?’

‘Solid. Definitely solid.’

‘Were you wearing glasses or sunglasses?’

‘No.’

‘Did you observe the object through the windscreen or windows of the car?’

‘Yes.’

‘Did you roll the windows down at any time?’

‘No.’

‘Any reflections on the windscreen or windows?’

‘I don’t know.’

‘Did you view the object at any time through binoculars, a telescope, a theodolite or any other optical instrument?’

‘No. There was no need for that. It was practically on top of us.’

‘Did the object make any sound?’

‘I don’t know. I’m not sure. I think it made a kind of bass humming sound. At first I thought I heard an explosion, but now I don’t believe I did. I believe I *felt* something. It was a sort of vibration – a vibrating noise. I don’t know. I can’t answer that one. There was noise… A vibrating.’

‘The smaller disks?’

‘A humming sound. They sometimes made a whistling noise. When they whistled, they shot beams of light over us… I’ve never heard a sound like that before.’

The black-haired man sat back and turned the tape-recorder off while the bald man pushed a sheet of blank paper at Richard and passed him a pencil.’

‘I want you to draw some simple pictures that will show the general shape of the objects,’ the bald man said. ‘Label and include in your sketches any details of the objects that you recall, such as wings or other protrusions, including exhaust and vapor trails. Use arrows to indicate the direction the various objects were traveling. Also include in your drawings any motion that the objects made. Place an “A” at the beginning of the path, a “B” at the end of the path, and show any changes in direction during the course of their movements.’

Richard did as he was told. His hands were visibly shaking. The room was bitterly cold but he was sweating, and he felt slightly feverish. The two men watched him quietly. They never took their eyes off him. He heard the rain beating at the window just beyond their heads. He did the drawings quickly. They were neat, accurate sketches. He then pushed the paper back to the bald man, who studied it carefully.

‘Good drawings,’ he said.

‘I’m an art student,’ Richard said.

‘Ah, yes, the Hornsey College of Art.’

‘That’s right,’ Richard said.

The bald man passed the paper to his more serious companion, who studied it, passed it back, turned his tape-recorder on again, and then spoke directly to Richard.

‘Okay. Were the edges of the large object fuzzy, blurred, or sharply outlined?’

‘The smaller disks were sharply outlined. They were disk-shaped and silvery. I couldn’t see the edges of the big one. Its flashing lights were too bright. The body was just a dark mass and the flashing lights rendered its edges invisible.’

‘What length would you estimate the various objects to be?’

‘Not length: diameter. The big one was about three hundred feet wide and at least several stories high. The smaller disks came in two sizes: the first two were about three feet in diameter, the second two, which came out later, appearing to draw the car forward, were about thirty-five or forty feet wide. The first two disks were completely solid, with no visible features. The second two had a perimeter that swept up to form a dome. The dome seemed made of something like glass or Perspex. I remember seeing figures in there. And I didn’t imagine that…’

‘Never mind the occupants. What do you think the objects were made of?’

‘Some sort of metal.’

‘You used the word “silvery”.’

‘Silvery or metallic-gray.’

‘What were you doing at the time you saw the first object, the big object, and how did you happen to notice it?’

‘I was in the passenger seat of the car. The woman was driving. The engine spluttered and died, the headlights went out, then the car rolled to the bottom of the hill and came to a stop. Then I thought I heard something. I didn’t hear it: I *felt* it. Then the car was filled with light – the whole area was flooded with light – and that light swept over the stones in the field nearby and materialized as the object.’

‘What direction were you heading before the car stopped?’

‘Southwest.’

‘What direction were you looking toward when you first saw the object?’

‘Toward the sinking sun. West.’

‘Are you familiar with angular direction?’

‘No.’

‘What were the weather conditions at the time you first saw the object?’

‘It had been raining most of the day, but the clouds were disappearing, and the sky was red but gradually turning dark. There was mist coming over the hills, but none around us.’

‘There was no mist near the car when you were driving?’

‘No.’

‘Any mist during your encounter with the large object?’

‘No. Just the white haze.’

‘You’re certain that this white haze wasn’t mist?’

‘Yes. It was light.’

‘Wind?’

‘I don’t think so.’

‘Temperature?’

‘Pretty cold.’

‘What was the approximate speed of the large object in flight?’

‘I’m no good at judging speeds.’

‘Roughly.’

‘About thirty miles an hour.’

‘*Thirty*?’

‘Yes.’

‘You know that’s theoretically impossible?’

‘Yes. It seems impossible, but that’s what it was doing. I mean, that thing was just… *drifting*.’

‘The smaller disks?’

‘I couldn’t say. They were fast. But they could also sit, or hover, in midair, just kind of drift around the car, or shoot off in the blinking of an eye. I couldn’t give you even an estimated speed.’

‘Can you give me an estimation of how far away the large object was from you?’

‘When it came down, it was about fifty yards from the car, give or take a few yards.’

‘Did it give off any heat?’

‘Yes, I think it did. I remember feeling hot and suffocated… but I *was* pretty frightened.’

‘Was this the first time you had seen an object, or objects, like this?’

‘Yes.’

‘Ever thought about them?’

‘Not much.’

‘Did anyone else see the objects?’

‘The woman driving the car.’

‘Apart from her.’

‘No.’

‘When did you first report this officially?’

‘Yesterday.’

‘Why did you wait so long?’

‘I was frightened.’

‘Frightened? Of what?’

‘I didn’t think anyone would believe me.’

‘Anything else?’

‘I was just frightened in general. I was frightened by what had happened. I couldn’t really believe it myself – I didn’t *want* to believe it. Also, I had nightmares. I kept dreaming about the incident. I thought maybe I was going a little crazy. I didn’t want to tell anyone.’

‘What did you dream about?’

‘I’m not sure. I could never recall the dreams clearly… Just dreams of the white haze, silhouettes all around me, alien creatures, not saying a word, just crowding around me.’

The black-haired man nodded and switched his tape-recorder off while his bald friend pushed more paper toward Richard.

‘I want you to draw the occupants,’ he said.

‘I can’t remember their details,’ Richard said.

‘Just try,’ the bald man said. ‘Try to remember. Just give us some idea.’

Richard did as he was told, but his hands were shaking worse than ever. He was also sweating and the fear was returning as he drew the weird faces. It took him longer than before. He found it hard to concentrate. He heard the rain against the window, the steady breathing of the two men, and his heart was racing faster than normal, as if succumbing to panic. He finally finished the drawing. It looked childish and ridiculous. He pushed it back to the bald-headed man and watched him thoughtfully study it.

‘A little Picasso,’ the man said.

‘That’s what they looked like,’ Richard said.

‘Do you think they were wearing some kind of mask?’

‘Yes, I do,’ Richard said.

The bald man smiled at him, passed the drawing to his partner, and the other man studied it for some time before setting it down. He then looked directly at Richard, not smiling, and switched on his tape-recorder.

‘Is that nose supposed to be metal?’

‘That’s what it looked like,’ Richard said.

‘And a mask could account for the lack of lips?’

‘That’s right,’ Richard said.

‘Did the glass, or Perspex, dome distort their features?’

‘I think so,’ Richard said. ‘I couldn’t really see past their heads – that dome blurred the interior.’

‘They stared at you?’

‘Yes.’

‘Did they make any gestures?’

‘The creature in one of the disks raised his hand. It looked like a claw.’

‘A metal claw?’

‘Yes.’

‘Any skin?’

‘Gray and wrinkled. The skin around the eyes seemed wrinkled, but I can’t be

too sure of that.'

'Why?'

'Like I said, the transparent dome distorted their features. It was transparent, in a frosted-glass kind of way. It had a rippling effect.'

'What did you do when the creature raised its hand?'

'That's when I blanked out. A beam of light suddenly shot over me and I think that's what did it.'

'And then?'

'I don't think I was unconscious for very long. I think it was only a few seconds. I woke up and saw the big object coming down and blocking out my whole view. Then our car was drawn toward it. The car was dead, but it was moving. The thirty-five or forty-foot disks were at both sides of the car, shooting beams of light at the car and seeming to draw it forward.'

'You say thirty-five or forty feet. That's seems to me to be a fairly precise estimate.'

'I know. I don't know why I think that… But I always feel sure of it.'

'Okay. Continue.'

'That was it,' Richard said. 'We were pulled toward the big object. The colored lights flickered on and off, the ship seemed to split along the bottom, we were drawn all the way inside, saw a dazzling white light and silhouetted figures, and after that, I don't remember a thing… I guess I just fainted.'

'Not recovering until three days later.'

'That's right. About thirty miles away.'

‘And you’ve absolutely no idea how you got there?’

‘No. No idea.’

‘Have you ever suffered from amnesia?’

‘No, of course not.’

‘We can check on your medical records.’

‘You won’t find amnesia.’ Richard scratched at his beard, studying the two men in turn, wondering what they were thinking, feeling nervous again. ‘The police doctor,’ he said. ‘That guy examined my burnt neck. The cops said they would give you the report. What did it say?’

‘There was a burn mark all right. Unfortunately it was nearly gone by the time you were examined, so it’s impossible to say at this stage what caused it. Otherwise you’re unchanged.’

‘Unchanged?’

‘Your blood sample revealed nothing unusual.’

‘What did you expect to find?’ Richard asked.

‘Nothing,’ the man said. He switched the tape-recorder off, clasped his hands beneath his chin, tapped the fingers of both hands together and kept staring at Richard.

‘Well, what do you think?’ Richard asked.

‘What do you expect us to think?’

‘I want to know what really happened out there.’

‘I think you imagined it.’

‘Imagined it?’

‘Yes. Your story’s not credible,’ the man said. ‘I’m afraid the pieces don’t fit together. Your story doesn’t make sense.’

‘*What* doesn’t make sense?’

‘None of it,’ the man said. ‘Your experience can’t be real because such objects and such creatures simply don’t exist.’

‘But I *saw* them!’

‘You *think* you saw them. You possibly saw a mirage. You saw the reflection or an airplane or ship, caused by a temperature inversion.’

‘It was *real*!’

‘No, it wasn’t. It couldn’t have been real. No object that big can fly at thirty miles an hour and then hover without a sound above the ground. It’s scientifically impossible.’

‘*What’s* scientifically impossible? What the hell does *that* mean? All I know is that it *happened*, that it happened to *me*, and that I came here to get an explanation because that’s what I need.’

‘What can *we* explain?’ the man said. ‘Do you expect us to *confirm* it? Unidentified lights were can discuss, but what you saw is pure fantasy. It’s simply not possible. There’s no way we can accept it. Sadly, the facts speak for themselves: your whole story is nonsense.’

‘Oh, shit!’ Richard said.

‘Not shit – facts. Just one more question to ask and then we’re finished: Were you drunk when you saw it?’

‘Drunk?’

‘You heard me. I repeat the question: Were you drunk? According to the report you gave to the police, you were drinking that evening.’

‘Well, yes, but… ’

‘You were drunk.’

‘I don’t think that has relevance – ’

‘The woman herself said you drank a lot. In fact, she said you were plastered.’

Richard straightened up again, suddenly feeling disorientated, recalling the gleaming white Audi and the woman with red hair and green eyes. That woman had disappeared. She was gone when he awakened. But she had been there and had shared the experience with him… This just didn’t make sense.

‘The woman?’ Richard whispered.

‘That’s right: your driver. We located her at her home in St Nicholas and she told us her story. She remembered picking you up. She said you helped her fix her stalled car. She said that you drank a lot, that you became extremely drunk, and that she had to tip you out close to Bodmin when you became too offensive. She didn’t see any UFOs. She saw nothing unusual. She said she dropped you off near Bodmin, that you were swaying from side to side, and that you staggered back the way you had come – heading straight back to Bodmin Moor. That’s the last she saw of you. Her drive home was uneventful. In short, she experienced nothing unusual – and neither did you.’

‘She’s lying!’ Richard shouted.

‘I don’t think so,’ the man said. ‘Why would she do that? I think you became extremely drunk, that you hitchhiked back to Dartmoor, that there you saw Venus or ball lightning or a mirage caused by a temperature inversion; and

that in your drunken state you thought it was real and then you imagined the rest. It's not that uncommon. People see things all the time. In a drunken condition a natural occurrence can shock you and make you see what's not there. It was all in your head, lad.'

'You don't believe that,' Richard said.

'Yes, I do,' the man replied.

'Christ, mister, I'm telling you the truth!'

'Or what you *think* is the truth.'

Richard inwardly collapsed, feeling crushed and defeated, the fear rushing back to swallow him whole, leaving him senseless. The two men cleared the desk, snapping the locks on their briefcases, then they walked around Richard without a word and opened the door of the room. Richard jerked his head around and stared up at both the men. The black-haired man was leaving the room, but the bald man still stood there. Richard didn't know what to say. The walls were closing in on him. The bald man was just standing there, smiling, as Richard stared up beseechingly.

'Sonny,' the bald man said with a smile, 'you'd better see your psychiatrist.'

CHAPTER ELEVEN

Professor Vale was paralyzed. He knew this almost immediately. Opening his eyes, he flicked them left and right because his head wouldn’t move. The room was all white, shaped like a geodesic dome, its triangular plates made of aluminium, joined by thin, steel-gray tubing. The professor licked his dry lips. The paralysis didn’t bother him much. He felt dreamy and unreal, removed from himself, content just to lie there on the bed and let events take their course.

His eyes flicked left and right. The circular wall was white and featureless. The sole door was molded into the wall as if it couldn’t be opened. The professor was impressed. He had never seen a room like it. He gazed up at the bright, dome-shaped ceiling and saw two porthole windows. What they revealed was beautiful. Exotic fish were gliding past. The professor realized that he was deep in the ocean, probably down on the sea bed.

None of this bothered him. In fact, he found it interesting. He heard the breathing of someone nearby, but he couldn’t quite see them. This didn’t concern him: he would see them soon enough. He tried to move, but the paralysis was total, so he just lay there quietly. The whole room was quiet. There was a distant humming sound. He heard the breathing of the person nearby and tried turning his head. This time he could move it.

There was another bed in the room, about twelve feet away, made from shiny white plastic, its solid sides sweeping down to meet the floor, the rest of it seemingly molded to fit the body of the man sleeping upon it. This man was covered in a surgical gown and had a metallic skullcap on his head, with

electrodes joining the skullcap to the various colored wires that ran back into a console behind the bed. The professor studied the man at length. The man appeared to be in a coma. There were straps around his ankles and wrists, with more wires dangling from them.

The room was shaped like a gigantic eggshell. The professor looked up at the ceiling. He saw exotic fish staring down through the portholes before disappearing in green murk. It was eerily beautiful. The silence was serene. The room's antiseptic whiteness, its seamless circular wall, gave it the appearance of an enormous sheltering womb and made him feel almost childlike.

The professor raised a hand to touch the hair on his head and felt his fingers scratching his scalp. He wasn't wearing a skullcap. The paralysis was fading. He wriggled his toes and felt the muscles in his legs and then he slowly sat upright. He felt dizzy and weak, his stomach nauseous and rumbling, but he took a deep breath and glanced about him and soon felt much better.

The other man was still unconscious, hardly moving, breathing evenly, his face lean and pasty, almost deathly, his chin in need of a shave. The professor studied the strange bed. It was molded out of the floor. Thrusting out from the wall behind it, looming over the bed itself, was a until containing lamps and plasma jars and an X-ray camera, this whole unit also molded with sensual grace from the shiny white plastic.

The professor gazed around the room. The shining whiteness stung his eyes. He glanced up and saw the fish at the portholes and then remembered the boat… The sea had turned to green steam. The metal jaws had closed above him. The metal jaws had become a giant version of the room now surrounding him… The professor was fascinated. He understood that he was drugged. He swung his legs off the bed, placed his bare feet on the floor, then stood upright, swaying slightly from side to side, making sure he was strong enough.

The floor wasn’t moving. It didn’t sway or vibrate. It appeared to be made of fibre-glass and was comfortably warm. The professor wondered where he was, wondered what was expected of him; he no longer felt in charge of himself and wanted someone to guide him.

The humming sound came from a distance. He thought it came from beyond the door. The door had no visible handle, no keyhole or lock, but when the professor approached it and touched it, it slid open silently, sliding into the wall. The professor just stood there. He kept rubbing his eyes. He tried to tear himself from what he was looking at, but he couldn’t escape from it.

He was looking along a corridor that curved gently out of view, its walls shaped like a tunnel, gleaming brightly, broken up with large windows. These windows were rectangular, revealing the ocean bed, beams of light boring through the murky depths, illuminating an aquatic wonderland.

The professor advanced into the corridor, gazed through the nearest window, saw smooth rocks and multicolored plants and bizarre, swimming creatures. It was awesome, incredible, the flooded landscape of a dream: the fish monstrous and minute, stunningly beautiful and grotesque – pulsing gills, flapping fins, eyes like prisms and stars, their colors changing as they merged with one another and formed wavering rainbows. The ocean bed was stone and sand and had a fathomless mystery; the sand swept out and drifted around the rocks which were alive with primordial life. The professor almost stopped breathing. He was stunned by what was out there. He saw a huge uncoiling eel, a web of glistening, writhing tentacles, a gelatinous mass of gold, green and violet sniffing at shrinking, possibly carnivorous plants. He saw it all in the beams of light. The lamps were fixed outside the windows. The beams of light were the only illumination in those dark, vitreous depths.

The professor advanced along the corridor. The floor warmed his bare feet. He was still wearing his flowered shirt and shorts, and that worried him slightly. How long had he been down here? Had he slept for hours or days? The questions flickered through his mind and then departed without having

quite touched him. He felt only curiosity, an overwhelming sense of awe, obsessed with the need to go farther and make contact with someone. He didn't question this desire: the need itself was enough. He kept walking, passing more windows and the ocean's teeming life, and the corridor kept curving away from him in what seemed like a circle.

The humming sound grew louder. There was a rhythmic vibration. The professor arrived at an open door on the inside of the corridor, and stopped there, momentarily transfixed, before stepping up to it. The noise here was much louder and had a hollow, echoing tone. He looked through to an immense geodesic dome filled with catwalks and ladders.

The professor stood there for a long time. He remembered seeing all this before. He glanced up at the silvery-gray dome and remembered it closing. Then he looked down again, saw the catwalks and ladders. There were glittering floors and platforms, modules made from steel and glass, mazes of shining pipes and generators, arc lights blazing from white walls. There were people down there, faraway, looking tiny, all dressed in coveralls, climbing ladders, crossing catwalks, moving up and down those dizzying depths in elevators like cages. The professor stepped up to the door. It hissed angrily and slammed shut. He touched it, but it didn't open again, so he shrugged and walked on.

He was amazed but not frightened. He understood that he was drugged. This knowledge filled him with a distant, dry amusement that didn't quite come to life. The corridor stretched out before him, kept curving away from him. He passed more windows looking out on the murky depths and then he came to another open door. He tried to step through it, but it slammed shut in his face. Shrugging again, he turned away, feeling calm, unperturbed, understanding that he had to keep walking and that the closed doors were guiding him.

Eventually he reached the end of the corridor and found himself outside a large, white-painted room. Stepping into the room, he surveyed it with almost clinical detachment. The room was circular and dim, without windows, quite

cold, lots of beds placed equidistant from each other, positioned all the way around the room and melting into the floor. All the beds were occupied, filled with men, women and children; they were all lying quietly, wrapped in surgical gowns, wires running from electrodes in their heads, hands and legs, coiling up to the ECG monitors that were fixed to the wall. The regular breathing of the people on the beds was surprisingly loud in the silence.

The professor shivered briefly. He wasn't frightened, but he felt peculiar. He walked across to the far side of the room and passed through to another room.

This room was also circular, but much bigger and brighter, its walls lined with glass cabinets and winking digital control panels, with two prop-up surgical beds, surrounded by tall equipment units, positioned in the center of the floor, their headrests raised slightly. There was a dwarf at one of the beds, his spine bent, his legs twisted; he was wearing a white gown, working swiftly and silently, his unusually pale and delicate hands flipping back a white sheet.

'Where am I?' Professor Vale asked. 'Who are you? Where's Mr McKinley?'

The dwarf finished his job, unconcerned, working lovingly, then he turned and stared up at Vale with large, slightly glazed eyes. He then sniffed and scratched his ear, shuffled forward laboriously, his head rolling loosely from side to side, buried between his raised shoulders.

'Ah,' he said, 'you're awake!'

'Where am I?' Vale asked.

'We were expecting you,' the dwarf said.

'Who are you?'

'I stayed here. I was waiting.'

‘Where’s Mr McKinley?’

The dwarf nodded agreeably, his head rolling from side to side, then he went to what looked like a dentist’s chair and raised the headrest. Vale studied the glass cabinets, which were about six feet long, all of them containing a naked human, either unconscious or dead. The glass was lightly frosted. The control monitors were flickering. Vale realized that they were cardiograph and ECG readouts, and that the people in the cabinets were still alive. He returned his gaze to the crippled dwarf, who was grinning inanely, waving him forward. Vale stepped over to the chair and sat in it without asking himself why he had done so.

‘You are comfortable?’ the dwarf enquired.

‘Yes,’ Vale said.

‘No fear,’ the dwarf said. ‘Fear is foolish.’

‘Where’s Mr McKinley?’

The dwarf nodded his understanding. ‘Mr Wilson comes soon,’ he said. ‘I press a button to call Mr Wilson, and then your fear… fear is over.’

Vale remained in the chair, studying the dwarf, intrigued by him, watched him shuffling across the floor and pressing a red button that was fixed to the wall. The dwarf grinned at him and nodded, then shuffled along to one of the cabinets, pressed his nose to a pane of frosted glass and stared at a naked man. The man appeared to be dead, but the readouts confirmed that he was alive. The dwarf turned away from the cabinet and returned to Vale. He looked curiously at Vale, his eyes large and slightly glazed, then grinned inanely and pointed to a spot just above Vale’s head.

Raising his gaze, Vale saw a circular white canopy. Sunken into the face of the canopy were surgical lamps and convex lenses, surrounding a stereotaxic skullcap and loosely dangling electrodes. Vale studied the canopy. It also

housed an X-ray camera. He studied the electrodes and the skullcap, then he looked at the dwarf.

‘Who are you?’

‘I wait here.’

‘Who *are* you?’

‘I work good.’ The dwarf grinned and waved his delicate hands, ‘No need for fear… fear is over soon.’

Vale looked up at the domed ceiling of the room. It seemed to shine with natural light. Feeling unreal, but not at all frightened, he looked back at the dwarf. The pathetic creature was still grinning. His hands clashed with the rest of him. Compared to the crippled legs and the bent, distorted spine, the unusually pale and delicate hands might well have belonged to someone else. The dwarf grinned and nodded repeatedly, pointing excitedly to the nearby doorway. Vale looked up as McKinley walked in, his blue eyes clear and steady.

‘I’m Wilson,’ he said.

‘I thought you were McKinley.’

‘McKinley came to an unfortunate end. I am Wilson. Remember that.’

Wilson looked neat and cool, his shirt and trousers a matching black, outlined against the white of the circular room, a slight smile on his face. Vale remained in his chair, again wondering why he didn’t feel fearful. Then he remembered his belief that he’d been drugged. As if to confirm this, Wilson took a step forward, leaned over Vale, placed his thumb on Vale’s eyelid, pressed the eyelid upward, looked intently into Vale’s eye, then removed his thumb and stepped back.

‘You find this interesting?’ he asked.

‘Yes,’ Vale said without thinking.

‘And you don’t feel any fear?’

‘I don’t think so,’

‘Well, that’s as it should be.’

Vale glanced around him, at the white walls and naked people in the frosted glass cabinets. He still didn’t feel any fear. Only an academic curiosity.

‘Was I drugged?’

‘Of course.’

‘I don’t really feel much different.’

‘You *are* different. The fact that you don’t feel any fear should be enough to confirm it. Think about it, professor. What you’ve just been through would normally have terrified you, but you’re behaving as if untouched by it. Think of what happened on my boat. Think of where you woke up. Think of what you saw as you walked to here and why you’re still not fearful. Of *course* you were drugged. Otherwise you would be mad. Even now, as you sit there, you’re still drugged, which is why you’re so calm.’

‘What kind of drug is it?’

‘More advanced than any you know. Scientifically and medically, the world you inhabited is antiquated. You will soon find that out.’

Wilson crossed to the glass cabinets and waved languidly at them. ‘Observe,’ he said, ‘the wonders of our science. They will sleep till I waken them.’ Turning around, he looked down at the dwarf, who was grinning and nodding excitedly. Wilson patted the dwarf lightly on the head and then offered a

bleak smile. ‘This is Ruediger,’ he said. ‘He has wonderful hands. We removed his hands and gave him metal claws and then we gave his hands back to him. Of course they’re not his old hands. In fact, they’re not flesh and blood. Nevertheless, they are as good as the originals, and the patient is happy.’ He returned to Professor Vale, leaned close to him, stared at him. ‘And you still don’t feel any fear?’ he asked.

‘No, I don’t. I don’t think so.’

Wilson smiled and straightened up, then returned to the glass cabinets against the wall and indicated the bodies. ‘They’re all alive,’ he said, ‘though we’re killing them slowly. We want to preserve them for the future, so they’ll have to die gently. We will drain all their blood, then replace the blood with glycerine and dimethylsulfoxide to prevent ice crystals forming in their tissues. Then we’ll wrap them in aluminium foil, place them in cryonic storage chambers , and only resurrect them when we need them.’ Turning away from the cabinets, he walked back across the room, leaned once more over Vale and offered his bleak smile. ‘And you *still* feel no fear?’ he asked.

Vale glanced around the room to see the smooth, circular wall, the solid geodesic dome that shone brightly above him. Then he studied the cabinets. The frosted glass distorted the naked bodies. The jagged white lines jumped erratically just above them, moving slower each second, indicating that the bodily functions of those still living were gradually running down. Then Vale looked up at Wilson, taking in the cold, intelligent eyes, the tanned, strangely unlined forehead under the shock of white hair.

‘Who are you?’ he asked.

‘I’ve just told you: I’m Wilson.’

‘Where do you come from?’ Vale asked.

‘You’ll learn that when you need to.’

‘And the bodies in the cabinets?’

‘What about them?’

‘Where do they come from?’

‘From Earth,’ Wilson said. ‘From all over. We picked them up from here and there.’

‘I’m not frightened,’ Vale said.

‘No. You’re still drugged.’

‘What do you want from me?’ Vale asked.

‘I want your brain,’ Wilson said.

Professor Vale felt nothing. He was numbed to rational feelings. He just sat there, staring around the strange room, wondering just where he was. He remembered the triangular steel spikes, rising inexorably, closing above him; recalled sinking through a shimmering white haze, past steel catwalks and ladders. All of that and much more: his long walk along the curving corridor, the large windows, the ocean bed, the great dome that soared above the immense decks and workshops, dwarfing the men in the modules of steel and glass, reverberating with the sounds of ceaseless activity. He was at the bottom of the ocean. This room was part of something enormous. He was possibly in an undersea city, but he couldn’t be sure of that.

‘Put your head back,’ Wilson said.

‘Pardon?’

‘Put your head back. I want to place this skullcap on your head. This won’t take very long.’

Vale did as he was told. Wilson pulled the skullcap down. Vale felt the cold

metal against his scalp, and then he felt a slight pressure.

‘You don’t have to shave my head?’

‘No, my dear professor. We’re not as primitive as that. We bypassed all that long ago. This operation is simple.’

Wilson adjusted the skullcap. It tightened around Vale’s head. Raising his eyes, Vale saw a tangle of electrodes dangling down just in front of him. A pair of hands came into view, unusually pale and delicate; the crippled dwarf was leaning over his shoulder to insert the electrodes. Vale didn’t move. He was surprised by his own serenity. He knew that what was happening was a nightmare, but it was happening outside of him. The dwarf inserted the electrodes. There was a faint ringing sound. Vale tried to raise his hands to his head but found them strapped to the armrest. His hands and forearms tingled. The chair’s arms were vibrating. Vale sat there, unable to move a muscle, reconciled to his fate.

‘No fear,’ the dwarf said. ‘Fear is over… No fear in your future.’

Vale couldn’t see the dwarf. Clearly the dwarf was still behind him. Wilson was standing directly in front of him, a bleak smile on his face.

‘In 1932,’ he said, ‘Dr Walter Hess devised the modern technique of electrode implantation, thereby demonstrating that nearly all of man’s functions and emotions can be influenced by stimulation of specific areas of the brain. A state of constant drowsiness can be brought about by the simple electric stimulation of the caudate nucleus, the nucleus reticularis, or the inferior thalamus; conversely, a similar stimulation of the mesencephalic reticular formation will induce instant arousal. Man is thus a machine, to be utilized, controlled, operable by simple laws of give and take, without will of his own. The philosopher’s stone has been shattered. Philosophy itself has become redundant. The mysteries of the human mind, its creativity, its moral imperatives, have been reduced to a set of components that we endlessly play

with. Man is not a magical creature – he is merely a container of various impulses. These impulses can be rearranged to a pattern that will change his behaviour.'

Wilson flicked a switch, bathing Vale in blinding light, filling his head with an unusual incandescence and making it vibrate. Though Vale felt himself blinking repeatedly, he could not resist. He understood that what was happening was hideous, yet he still felt no fear. Drifting out of himself, he observed himself succumbing quietly, his head trapped in the stereotaxic skullcap, beyond which there was nothing.

'The hypothalamus,' Wilson continued, 'is the area of the brain that controls your most basic and primitive needs. By stimulating the appropriate areas of the hypothalamus with submicroelectrodes I can regulate your blood pressure, your heart rate and respiration; your sleep, your appetite, even the diameter of your eye pupils; I can place you in suspended animation or make you work till you drop… Do you understand this?

'Yes,' Vale said.

'Excellent,' Wilson said. 'Now the rather simple biocybernetic system into which you are now plugged consists of a fifteen-channel programmable brain stimulator and a normal LINC-8 digital computer with the appropriate interfacing equipment. At the moment, radiopaque materials are being injected into the intracerebral spaces inside your skull to facilitate, by X-ray, the visualization of various parts of your brain. The stereotaxic skullcap, utilizing minute spikes that have already pierced your scalp, is now taking the X-rays from a variety of different angles. At this very moment the stereotaxic apparatus is making geometrical calculations using the X-rays and reference-point grids to give me three-dimensional coordinates for the positioning of the electrodes… You will feel none of this.'

Vale sat quietly in the chair, his eyes closed in surrender. His whole head was vibrating, was glowing and warm, and he felt that he was crouched up in

there, his own skull surrounding him. It made him think of the great dome. His own skull was such a dome. It was immense and he was crouched at its center… overwhelmed by the vast, empty darkness.

‘The desired targets have been fixed. I am drilling into your skull. The steel electrodes are as thin as hairs, the micromanipulators are guiding them in, and in a moment you will feel an electric current as light as a feather. You will not feel any pain. You will experience a brief panic. This panic will pass away quickly, after which you’ll feeling nothing… I am taking your brain now.’

Vale sat very still, almost welcoming what was coming. His eyes were closed and he crouched in a darkness lit by tiny flashes of light. His brain’s interior was enormous. He actually thought he could see it. It was an immense, crenellated, dark dome rising up all around him. There was silence. A bass humming. A distant rumbling reverberated. He crouched alone in the wilderness of his mind and saw the holes in the sky. That sky was utterly black. The holes appeared as tunnels of light. The light burned through the curtain of darkness and exploded around him.

Vale shrank within himself, feeling helpless, totally naked, now whipped by a sudden, shocking terror that returned him to childhood. Then he heard his own voice, a strangled sound, hoarse and pitiful, gasping out its anguished plea for release, its final expression of will:

‘Please don’t,’ he whimpered.

It didn’t matter after that. The fear passed and he was calm. The light receded and he saw the dark walls of his captured, chained mind. There was a glowing in the darkness: the light of mindless peace. The walls retreated and dissolved all around him as he opened his eyes. He saw the radiant white room, the grinning dwarf, the glass cabinets, a seamless face staring at him, the cold blue eyes reflecting him.

‘I’m not from ACASS,’ Wilson said. ‘Mr McKinley was from ACASS. Mr McKinley wanted to hire you for his project, but we need you more. We need people everywhere. We have to know what’s going on. We need someone in the Cheyenne Mountain Complex, and you are that person. You will do what we tell you, without question, without fear; you will do it because you won’t have a choice, because you’ll feel that you want to. Your will is our will. What we will, you will do. You will live just for service, and that service will be to us – and in performing that service you will experience the most complete satisfaction.’

‘I understand,’ Vale said.

‘Good,’ Wilson said. ‘Understanding is enough. We will now take you back to Miami and deposit you there. You will return to your hotel room and have a sleep and awaken refreshed. You will not go to see McKinley. McKinley is dead. You will continue your vacation as before, as if nothing has happened. You will then return home. As usual, you will go to work. You will renew your contract with USAF, continue your work in the Cheyenne Mountain Complex, and then do whatever your head tells to do, without fear or regret. You are not responsible for your actions. Your will is our will. You will do what we tell you to do and through that know contentment. Now stand up, professor.’

Professor Vale stood up. He surveyed the circular room. The white walls and the naked bodies in the cabinets now offered him comfort. When he looked at Mr Wilson, he felt a warm, transcendent peace. The blue eyes of Mr Wilson were his will and he felt a great freedom. The crippled dwarf shuffled toward him, head rolling, hands outstretched; Professor Vale saw the hands, pale and beautiful, waving him forward.

‘Can I go now?’ Vale asked.

‘We’ll take you back,’ Wilson said.

‘I feel pretty tired,’ Vale said. ‘I think I need a good sleep.’

The dwarf left the room first, his legs jerking mechanically, leading Vale into another white-walled corridor that curved out of view. Wilson followed Vale, moving slowly and carefully. They all went along the corridor, past blank walls, in silence, eventually arriving at a high, narrow door that led into another room.

‘We’ll wait here,’ Wilson said.

The dwarf nodded, shuffled away and stopped in front of a closed door. Vale recognized it as the door of an elevator. The dwarf pressed a button. When Wilson pointed to a chair placed beside the elevator, Vale took the chair without a word.

‘It won’t take long,’ Wilson said.

Vale gazed around the room. It was white and rectangular. One whole wall was a sheet of convex glass that looked out on the ocean bed. Bright lights beamed into the murk, streams of green and silver shimmered, shoals of transparent fish and giant squid and monstrous eels swam back and forth as if in slow motion, colors glinting and merging. It was a scene of unearthly beauty. Vale thought it was wonderful. He saw bulging eyes, bizarre fins and rainbow scales, teeth that gleamed like polished razors in jaws as round and smooth as the rocks. The sand formed extraordinary patterns, tiny stones flashed like diamonds, the rocks alluvial, sensual, starkly shadowed, mysterious, alive with a minute, primordial life that defied description. It was all too much for Vale; he let his gaze cleave to the walls. The walls were white and had a pure, glacial sheen only stained by his shadow. He turned his head to glance behind him. Another window displayed the great dome. Below the dome were canyons of glass, steel and plastic: that materialization of a science beyond normal reckoning. Professor Vale felt close to tears, wanting to never leave this place. He turned again and looked directly at Wilson and knew what he must do.

‘You understand?’ Wilson asked.

‘Yes,’ Professor Vale said.

‘Your work will be important. Most valuable. You will always be warmed by that knowledge.’

‘I understand,’ Vale said.

‘Understanding is enough. We will always be with you to guide you. What we need, you will get for us.’

‘I understand,’ Vale said.

The elevator door opened. Wilson motioned with one hand. Vale stood up and felt a great peace as he stepped inside. Wilson fell in behind him. The steel walls shone like glass. The door closed and the elevator descended, dropping smoothly and silently. Vale studied his own reflection, saw his shadow on polished steel; he felt calm and alert and in control, and out of this sprang his pleasure. Wilson offered him a smile. Vale filled up with pride. The doors opened and he followed Wilson out and saw the high, curving walls.

‘This is a wonderful place,’ he said.

‘I’m glad you like it,’ Wilson said.

‘I hope I can come back here some day.’

‘You will,’ Wilson said.

The steel floor was enormous, the dome sweeping up high and overhead. Around the walls, scaling dizzying heights, were the catwalks and ladders. Hidden lights cast long shadows, modules piled upon other modules; there were enormous generators and pumps and miles of criss-crossing pipes. Most

of the workers seemed faraway and wore different colored coveralls, moved up and down ladders, crossed the catwalks and balconies, and were silhouetted behind the long windows that glowed orange and blue. All of this was bathed in the white haze. Vale's shadow was stark. He looked straight ahead, across the immense lower floor, and saw Wilson's boat on the platform.

'That's some boat,' Vale said.

'Yes, it is,' Wilson said.

'If you meant to impress me, you've succeeded.'

'We always do,' Wilson said.

They walked across the steel floor, their footsteps ringing with a hollow sound, eventually stopping at the platform that was raised off the floor on hydraulic supports. Vale looked up at the boat and saw the crew hard at work. The domed roof was high above, a monstrous jigsaw of shadow and light, and the large boat seemed small beneath it, isolated in open space. The crewmen working in silence looked vaguely Oriental. The crippled dwarf was at the top of the ramp that ran down to the floor.

'After you,' Wilson said.

Vale made his way up the ramp and stepped onto the deck, the dwarf reaching out and touching his wrist and then shuffling away again. Now on the platform, Vale leaned on the railing and glanced back over his shoulder. He saw Wilson coming up the ramp, stepping onto the platform, then hurrying across the rectangular entrance to the vast working space. In there, the light glinted off the modules, off the ladders and catwalks, then fused and became a white haze that spread across the machinery. Vale thought it was beautiful. He didn't really want to leave. Turning around, he saw Fallaci, still dressed in his white suit, leaning casually against a white-painted bulwark

while talking to Wilson.

Someone tugged at Vale's trousers. He glanced down and saw the dwarf. The pitiful creature was grinning at him, head bobbing, hands waving.

'You feel good?' the dwarf asked. 'You feel better? No fear for your future?'

'No fear,' Vale said.

Wilson came up to him. 'We're going up now,' he said. 'You won't feel anything until we reach the surface, then the boat may rock slightly. Hold on to the railing.'

Vale did as he was told. It seemed a natural thing to do. He felt a slight vibration, heard a muffled droning noise, then the steel platform under the boat began to rise, moving up toward the domed roof. Vale glanced around him, saw the ladders and catwalks, felt a sudden, immeasurable loss as it all fell away from him. The steel platform kept rising, the boat rocking imperceptibly. Vale glanced below, at the workshops and modules, and wished that he could stay here forever to explore all these wonders.

'Hold on now,' Wilson said.

The platform stopped rising, its silence broken by muffled rumbling. The noise came from the encircling wall of the great dome, reverberating like distant drums. Vale knew it was the sea. The dome was nearing the surface. He had a final look around him, saw that technological marvel, then put his head back and stared above him at the shadow-streaked metal dome.

There was a sudden roaring sound, an insane hammering and hissing, as the sea exploded around the surfacing dome and rushed down its curved outer wall. Vale held on to the railing. The boat rocked from side to side. The dome seemed to sway above him, then it steadied, reverberating with hollow sounds.

Vale kept looking up, the roof of the dome still high above him, and saw thin lines of light, becoming brighter, growing longer, spreading out like the ribs of a giant umbrella to expose the vivid sky. Vale was enthralled. He stared up in deepening wonder. The dome was splitting into its separate parts, becoming four huge triangles, then the triangles themselves split in two and moved away from each other.

A shocking brightness poured into the open dome. The light was like an exploding nova. The striations blazed down around the boat and swept out through the gloom. Vale felt the burning sun, saw the vast arch of the sky. The immense, sun-reflecting, triangular walls were sinking all around him. Then he saw the hazed horizon, the shimmering sheet of the sky above. The sea boiled around the circle of sinking steel fins, then it swallowed them totally, poured across the broad steel deck, and soon the deck was nothing more than a black mass below the turbulent waves. There was a brief, hollow ringing, the boat rocked and steadied, then the black mass sank deeper, grew smaller, disappeared, and then the boat was drifting lazily in the sea, which rippled gently on all sides.

Professor Vale stared around him. The sea was calm and sunlit. Green waves rolled away to the horizon and a thin wedge of land. It was the coastline of Miami. The boat was heading straight toward it. The crewmen were moving back and forth, working silently at their tasks, the late afternoon sun beating down, flashing off steel and brass.

Vale leaned against the railing and saw Fallaci near the cabin. The dwarf had disappeared somewhere inside, but Mr Wilson was still there. Vale felt good about that. He was very fond of Wilson. Smiling, Vale leaned on the railing and took in the fresh air.

Wilson finally approached him. There was a waiter by his side. Wilson smiled thinly and nodded while the waiter bowed low.

‘What would you like to drink?’ Wilson asked.

‘Rum and coke,’ Vale said.

CHAPTER TWELVE

The dream of the Thousand Year Reich had all the grandeur of lunacy. Nothing was impossible. They firmly believed that. They had their Volkish socialism, their lust for an Aryan Utopia, and with the passion of all mad visionaries they stepped forth to create it. Mysticism? Yes. The Reich was born from mysticism: the Cosmic Circle of Munich, the Anthroposophy of Rudolf Steiner, the Theosophy and Rosicrucianism of Vienna and Prague, the ancient myths of Atlantis and Lemuria, of the undefiled German. Mysticism and racism: the 'pure' blood decreed by Schuler. The Third Reich sprang out of a vision of a Utopia devoid of Jews and subhumans.

Such dreams have no limits. Ordinary logic cannot contain them. In such dreams the Third Reich saw the light over limitless vistas – and ignored the impossible. The whole world would be changed. Cities and nations would be erased. The Earth would be cleansed of Jews and subhumans and other vermin; and in isolated colonies, in new cities of stone and glass, a chosen hierarchy of masters and slaves would create the New Order.

No doubt they were madmen. Their strongest leaders were demented. They were men who lived their dreams, who were divorced from reality, who like children felt that all things were possible and that nothing could stop them.

Science is logic. Mysticism is the opposite. I despised the mysticism of the Nazis, but could see its potential. My own dreams were grandiose. No democracy could afford them. I needed money and equipment and labour on a staggering scale. No democracy would sanction it. Only lunatics would. And the lunatics, all those mad visionaries, were the Reich's leading lights.

I knew this when I met Himmler. It was in 1935. Behind his glasses his eyes had the mildness of a priest or a fool. We were in his office in Berlin. I spread my drawings out on his desk. He glanced at them and stroked his thinning dark hair and touched his nose with one finger. He had once been a chicken farmer. Now he headed the SS. A mild and modest killer, puritanical, quietly spoken, he was seeking to resurrect Atlantis through a Reich filled with supermen. I had checked him out beforehand. What I learnt was enough for me. He believed in mesmerizm, in reincarnation and clairvoyance, in Horbinger's cosmic world of ice and fire, in gods and godmen. His SS was a religious order. His men were bound by blood and oath. Himmler wanted to isolate them, to brainwash them and remold them, to mate them with the purest German women and produce blond perfection. He had once processed chickens; now he wanted to process people: he had a dream of a disciplined Order of masters and slaves. I wanted a similar Order – but one devoted to science. And when Himmler raised his eyes from my drawings I knew I could have it.

Himmler checked me out thoroughly. He couldn't believe what I was there for. He first thought me an eccentric American who ought to be shot. I was held prisoner in Berlin. They interrogated me for months. In the Gestapo prison, in the Prinz Albrechtstrasse, I heard the screams of the tortured. My own interrogations were more casual. My cell was quite comfortable. They fed me and supplied me with books and let me work on my notes. The interrogations were conversational. The less fortunate continued screaming. For two months I kept repeating my history as they jotted down details. The prison was always busy. Bleeding unfortunates were dragged down corridors. I told my questioners of the project in Iowa and of how I had sabotaged it. The Americans don't know, I said. They believe the project was a disaster. My questioners tapped their pencils on the table and smiled at each other. Quite often I heard gunfire. It always came from the basement. I saw soldiers carrying bodies wrapped in shrouds and putting them into trucks. Such scenes did not disturb me. My hopes lived on undiminished. After two months, they concentrated on my drawings, still unsure of their

value. I don't know who first studied them. I think the Italian, Belluzzo. Nevertheless, I was released shortly after and taken back to see Himmler.

No point in even dwelling on the blood that had stained Himmler's hands. Such a quiet man he was. His good manners were impressive. A modest face with round glasses, his hair thinning and neatly parted, he sat behind his desk like a minor clerk offering assistance. He asked me what I wanted. I explained my requirements. He nodded in a slow, thoughtful manner, sometimes stroking his nose. We are very impressed, he said. Indeed, he added, we are astonished. He then told me that some technical advisors had thought my drawings miraculous.

I asked who these men were. He mentioned Belluzzo and Schriever. He said Belluzzo was getting too old, but that Schriever was brilliant. They wished to work on my project. Himmler thought it a good idea. I realized that he wanted to have me watched, but I nodded agreement. You are committed, he said. You must now bend to our will. You will never return to your own country; if you try, we will kill you. I reassured him immediately. I would report directly to him. My beloved project would be wrapped in strict secrecy and controlled by the SS.

I will never forget that day. My dream came alive then. Even now, the pain biting, my poor liver in disarray, I gaze out upon the glinting ice caps and remember it vividly.

I was driven to Kummersdorft West, sixty miles south of Berlin. We both sat in the rear of the car and looked out at the city. Himmler obviously loved Berlin. The sunlight flashed off his glasses. He stroked his nose and pointed out the sights with a clear, quiet excitement. The city was indeed majestic. The streets were filled with contented people. The walls were decorated with swastikas and flags and obscene propaganda. The word 'Juden' was prominent. I saw few on the pavements. Soldiers sauntered up and down and laughed heartily, in love with themselves. The very air seemed to smile. It was the triumph of the will. In its own perverted way it was the proof of

Man's awesome potential.

Perverted? Most certainly. With that truth I could live. Behind those walls were the high priests of a demoniac Order: Hermann Goering, Josef Goebbels, Rudollp Hess, Martin Bormann – alcoholics, drug addicts, occultists and degenerates – the very epitome of that gross irrationalism that I so much abhorred. There, too, the Gestapo butchers, the drilled ranks of the SS, and all the torture and murder that went on every day in the basements.

Yet I had to accept it. Science cannot moralize. Those irrational brutes were no more than the means to achieving my ends. Progress needs its trampled bones. Death gives way to more life. Evolution knows neither right nor wrong and transcends transient matters. So, I would work with them. In doing so, I could use them. And looking out upon Berlin, glancing sideways at Himmler, I felt nothing but hope for the future, the glow of fulfilment.

We drove out of the city. Aircraft roared overhead. Sitting beside me, very stiff and upright, Himmler started to talk. He was suddenly like a child. His eyes gleamed behind the glasses. The words poured out and splashed upon my ears as if they couldn't be stopped. He said the rocket teams had left. They had been moved to Peenemünde. The research center of Kummersdorft was empty and now it was mine. We passed troops on the road. The tanks growled through billowing dust. Himmler talked of Aryan blood and German might, of the world of the future. We will cleanse the Earth, he said. We will purify the blood. We will exterminate the Jews and the infirm and maladjusted, use the lesser races as slaves to the Reich, create a race of pure Nordics. There was no need to reply. Right or wrong did not concern me. When Himmler talked of his New Order, of his masters and slaves, I had the feeling that it just might succeed and that I could utilize it.

Unlimited labor was what I needed. No democracy could supply it. But here, in this country where all freedom had been suppressed, where the will of the people was one will – the Volk – and where discipline and slavery went hand in hand – here, at the dawn of the new era, I could do the impossible. Yes, I

grabbed at it. I was in my late fifties. I thought then, before I knew what could be done, that my time was too short. Thus, I didn't moralize. Not then and not now. I looked out at the aircraft, at the tanks and machine-gun carriers, at the troops who were numbered in their thousands, and accepted it gladly.

History will exonerate me. What I did, I did for progress. I sit now in my mountain lair, the frozen wilderness below me, and I know with the certainty of faith that my life has meant something. I am changing the course of history. I am aiding evolution. When I die, as I now know I must, my achievements will live on.

I knew this at the time. The sight of the proving range convinced me. The experimental station was between two artillery ranges, safely isolated from the surrounding towns and villages, all the hangars in good shape. Here Wernher von Braun had worked. And Walter Dornberger and Klaus Riedel. Those names, and those of Grottrup and Becker, made me smile condescendingly. The A-3 and A-5 rockets. So highly praised… so primitive. And the V-1 and V-2 would be feared when I thought them mere toys. Nevertheless, those men had gone. They had been moved to Peenemünde. They would not be here to observe what I was doing, would not know I existed. In this I agreed with Himmler. Even the Führer would not know. Himmler had his own plans for the future and did not want them mentioned.

Himmler showed me around the hangars. He introduced me to the workers. I met the Italian, Belluzzo, who was old and gray-haired, and the younger Flugkapitän Rudolph Schriever, who struck me as being dangerously ambitious. The old Italian was a physicist. Rudolph Schriever was an engineer. Both men were engaged in aeronautical research, both were keen on my drawings. I didn't really want those men. They had been around too long. I was distressed by their knowledge of my work, and by their closeness to Himmler. They obviously wanted to impress him: bowed and scraped in his presence. I knew immediately that they would try to pick my brains and then usurp my authority.

I could not allow that. What I required was total secrecy. After my experience in Iowa, learning that no one could be trusted, I had already planned to strengthen my position by becoming invaluable. I would hide the most vital facts. I would doctor all the drawings. I would split the work up, spread it widely among the work force, and thus ensure that no single individual could duplicate my success. In this way I would protect myself. I would become indispensable. And so, as I shook hands, as I talked to Belluzzo and Schriever, I decided not to let them get too close to whatever was workable.

Yes, I was ruthless. I had to protect myself. I was aware of my dependence upon the Nazis and of how weak that made me. Sooner or later they might disown me – the war might drain their resources – and if that happened, I had to be ready to make good my escape. I would take my secrets with me. I would leave them only useless toys. But by then, if I made good use of my time, I would have what I wanted.

Such thoughts were not expressed. Himmler smiled and led me out. We returned to his car and climbed in and headed back to Berlin. There was paperwork to be completed. Requisition forms and orders: more manufacturers, more instruments, more pyrotechnicists, more welding experts and laborers. I did not think it was possible. The required numbers were outrageous. I wondered if even Himmler, with his frightening, godlike powers, could requisition workers in such numbers for a clandestine project. Himmler smiled at my obvious doubts. He blinked repeatedly and stroked his nose. He said that I had no need to worry, that he had something to show me.

The fields of Germany were green. I heard aircraft overhead. We passed columns of troops and growling tanks, but the peace soon returned. This memory remains vivid. The sun shone from a blue sky. It was difficult to believe that war would come and devastate all of Europe. Then we passed barbed wire fences. Beyond the wire were smoking chimneys. We drove through guarded gates, beneath watchtowers and guns, kept driving toward the long wooden buildings, passed a series of gallows. The wind made the

ropes dance. Ragged prisoners were digging ditches. We drove on and reached the center of the camp and saw the Reich's hidden nightmare.

Himmler made the driver stop. A nervous soldier saluted us. We stood together in the mud of the compound, surrounded by prisoners. Himmler smiled and rubbed his nose. I saw the guards with the bullwhips. The hundreds of men, women and children were filthy and silent. Nearly all had shaved heads. Their bones showed through their flesh. Their large eyes were filled with anguish and despair and a hopeless submission. I heard the crack of the whips. Dogs snarled and someone screamed. Himmler blinked and rubbed his nose, smiled with unstated pride, and then waved one hand languidly in the air to take in all the misery.

'Your workers,' he said.

CHAPTER THIRTEEN

‘You don’t go too close to UFOs. It’s a dangerous thing to do. If you go too close to UFOs you get burned and you rarely recover. Just look at me, Stanford. I run this flea-pit in Albuquerque. I was a World War Two pilot, decorations up the ass; I fought in the Pacific and Europe and returned home a hero. What the hell am I doing here? You must have asked yourself that question. I ask the same question every night and I just wake up sweating.’

Gardner was leaning across the table, his right hand waving wildly, his left holding a glass of neat bourbon, the bottle in front of him.

‘Well, I tell you,’ he continued, ‘I’m not the only one like me. There are a lot of us hiding out, lying low, running scared, and we’re doing it because we haven’t a choice, because the doors have been closed to us. So you don’t talk about UFOs. If you do, strange things happen. You can never pin down just what it is, but things start going haywire.’

He raised his glass and drank more bourbon, slopping some down his shirt front, then he put his glass back on the table and looked around the bar. The place was crowded and noisy, a real home grown honky-tonk, with a jukebox blaring out of one corner, the lights mercifully dim. Stanford picked up the bottle, refilled Gardner’s glass, glanced casually at the women along the bar to see if one was worth having.

‘You knew Ruppelt?’ Stanford asked.

‘Sure,’ Gardner said. ‘You wouldn’t be here if you didn’t know that. We

worked for a time together, we respected one another, and even when he left, when those bastards pushed him out, he still came to see me now and then, very quiet, just for old time's sake. Ruppelt was a believer. I've no doubts about that at all. He was a believer and he died a believer, no matter what his book said.'

'You mean the revised edition,' Stanford said.

'Yeah, that's right,' Gardner said.

Stanford studied Gardner's face, the hollow cheeks, the bloodshot eyes, taking note of the stubble on his chin and his badly stained teeth. Something had happened to Gardner – something not very nice – and now the former Air Force hero was a wreck, always drunk in his own bar.

'I thought Ruppelt was a career man,' Stanford said. 'I'm surprised that he went against the grain by insisting – at least before that revised edition – that the UFOs were real.'

'He believed in the Air Force,' Gardner said. 'And the *Air Force* believed that.'

'I always thought they believed the opposite.'

'That was bullshit, Stanford. Public Relations diarrhoea. The Air Force believed in the reality of the UFOs from as far back as 1947.'

'Really?'

'Yeah, really. I was with the Air Technical Intelligence Center at the time – then based at Wright Patterson AFB in Dayton, Ohio – and believe me, we were in a state of near panic. And why? Because contrary to their own publicity, the military was being plagued with their own sightings: first over Maxwell Air Force Base in Montgomery, Alabama, then, to our horror, over the White Sands Proving Ground, New Mexico – right smack in the middle

of our A-bomb territory. Finally, what *really* got us going was a whole series of sightings in early July, 1947 – I think it was the eighth – over Muroc Air Base – now Edwards AFB – our top secret Air Force test center in the Mojave Desert.'

'I know about those sightings,' Stanford said. 'They really were something.'

'Fucking A,' Gardner said.

He put his glass to his lips, had a drink, topped up the glass, cursed the noise of the blaring jukebox, then put his glass back on the table. Stanford topped his own glass up, glanced around the crowded bar, taking note of the Stetsons and boots and girls in tight dresses.

'I'm told that those sightings led to Project Sign.'

'They did,' Gardner said. 'No less a luminary than General Nathan Twining, commander of the Air Material Command, wrote to the commanding general of the Army-Air-Forces stating that the phenomenon was something real, that it wasn't visionary or fictitious, and that the objects were disk-shaped, as large as conventional aircraft, and *controlled*. Shortly after that, about December '47, we established Project Sign, gave it a 2A classification, and handed it over to Wright-Patterson Air Force Base.'

'That was just before the death of Captain Mantell.'

'Yes,' Gardner said. 'A famous case.'

'I'm told he died chasing a UFO, but the Air Force denies it.'

'Right. Those fuckers tried to wipe it out. But that case, and a lot of other unknown sightings, really shook the hell out of us.'

'How do you mean?' Stanford said.

Gardner had another drink, licked his lips and glanced around him. He waved at a couple of friends and then looked back at Stanford.

‘Well,’ he said, ‘it prompted Project Sign to write an official, top secret Estimate of the Situation – and we didn’t piss around when we did it. That Estimate traced the whole history of UFO sightings, included the fireballs and ghost rockets and American sightings before 1947, and concluded, I kid you not, that the UFOs were of extraterrestrial origin. We then sent the report through channels, all the way to the Chief of Staff, General Hoyt Vandenberg, but the good general, to our amazement, sent it back with instructions to bury it.’

Sipping his bourbon, Stanford saw a girl at the bar, blonde hair tumbling to her shoulders, her firm breasts pointing at him. He smiled at the girl, she smiled right back, and he placed his glass back at the table, then scratched his right ear.

‘You run a good bar,’ he said. ‘Lots of action, I notice.’

‘I do my best,’ Gardner said.

‘General Vandenberg sounds pretty odd to me. He must have caused you some problems.’

Gardner nodded his agreement. ‘It was there and then,’ he said, ‘when that report was sent back, that we realized just how shitty our job was. In fact, word soon filtered back to us that Vandenberg had described us as being mad – and the repercussions of that judgement were pretty rough. Fear of further offending Vandenberg eventually led to a whole new policy: in future all Sign personnel were to assume that *all* UFO reports were misidentifications, hallucinations or hoaxes. Not only that, but we had to check with FBI officers, and with the criminal and subversive files of police departments, looking into the private lives of the witnesses to see if they were *reliable*. No need to say it: that was fair warning to all of us that it wasn’t wise to open

your mouth too wide… And shortly after that, the Project Sign Estimate of the Situation was incinerated.'

'Then Project Sign became Project Grudge.'

'Right. Can you imagine a more insulting name? A sure sign of General Vandenberg's displeasure.'

Glancing across to the bar, Stanford saw the girl with blonde hair, now talking to a heavily built brunette, both of them giggling. Turning her head, the blonde girl smiled invitingly at him, stroking her silky hair, then she turned away and whispered to the other girl and both giggled again.

'I've heard bad stories about Grudge,' Stanford said. 'A real shitty assignment.'

'Right. We were told to kill the whole affair. Now our job was to shift the investigation away from the actual UFOs and on to the poor bastards who reported them. Our task was to prove that the UFOs did *not* exist.'

'That must have been pretty difficult. I mean, according to the Grudge Report, snow job though it was, a good twenty-three percent of your sightings were still classified as unknowns.'

'Big deal,' Gardner said. 'That was obviously still too much for General Vandenberg. The same day we released that report, the Air Force announced the termination of the project, all the Grudge records were put into storage, a few officers walked the plank, and the rest of our personnel were widely scattered.'

'But you remained.'

'Yeah.'

'You must have felt pretty bad.'

‘I surely did,’ Gardner said. ‘I began to suspect that the Air Force top brass was only making a pretence at investigating UFOs when in fact they didn’t want us to find out anything. I couldn’t figure out their attitude. It didn’t make sense to me. All I knew was that reporting unknowns could lead to really bad trouble.’

Stanford studied Gardner’s face, saw the unfocused, bloodshot eyes, and was shocked by how far the man had fallen. It was best not to think about it. Men like Gardner were the victims. It was hard to think of Gardner as a highly decorated fighter pilot, hard to think of him working on Project Blue Book when that project was honorable. Gardner and Ruppelt had both paid the price. Now Gardner talked like a man without a future, still glancing fearfully behind him.

‘Tell me about Ruppelt,’ Stanford said. ‘There’s a really mystery there.’

‘No mystery, Gardner said. ‘Clear as glass. They just slipped the blade in.’

He topped up his own glass, emptied the bottle and put it down, picked it up again and waved to the barman and demanded another. Stanford sat back and waited. He didn’t want to push too hard. This was supposed to be a casual conversation and it had to remain that way. Stanford glanced around the room. The air was dense with blue smoke. High-heeled boots stomped the floor, Stetsons clashed, the tight dresses were plentiful. Stanford saw the blonde girl. She smiled and raised her glass to him. Stanford thought she might soften up Gardner, so he nodded and grinned. The barman brought them another bottle. He slapped Gardner on the back. When he left, Gardner topped up both their glasses, then started talking again.

‘Ruppelt was assigned to the Air Technical Intelligence Center in January 1951. Like me, he was working under Lieutenant Jerry Cummings. Now, up to that time Ruppelt hadn’t paid too much attention to UFO reports, but what he read in our files turned him on. As I remember, he was particularly impressed by two reports that involved movies taken at the White Sands

Proving Ground. Now bear in mind that the Proving Ground was fully instrumented to track high-altitude, fast moving objects – namely, the guided missiles – and had camera stations equipped with cinetheodolite cameras located all over the area. So, in two different days in June 1950, two UFOs were actually shot by two different cameras, and the guys who examined the results, by putting a correction factor in the data gathered by the two cameras, were able to arrive at a rough estimation of speed, altitude and size. According to their reports, those UFOs were higher than forty thousand feet, traveling at over two thousand miles an hour, and were over three hundred feet in diameter.'

'Jesus,' Stanford said.

'Yeah, right. Now those reports really got Ruppelt going. He was hooked on the UFOs, started working like a beaver, and that's when we really got together, going through the old files.'

Gardner gazed around the room. He was clearly becoming restless. He owned the whole bar, it was his, and he wanted to use it. Stanford recognized the signs. Gardner seemed a little petulant. Stanford thought of Epstein waiting in Washington, and decided to push it.

'What led to Project Blue Book?' he asked.

'The Lubbock Lights,' Gardner said. 'Those and the Fort Monmouth sightings. They really stirred the shit up.'

'This must be boring you,' Stanford said.

'I don't mind.'

'Let's have a little company,' Stanford said. 'That blonde and brunette.'

Stanford swiveled around in his chair, raised his glass to the blonde girl, then waved his free hand in an inviting gesture. The blonde glanced at the

brunette, looked back at Stanford, feigned surprise, then pointed her finger at herself and observed Stanford's nod of affirmation. Gardner looked on, surprised. He thought Stanford was pretty cool. The girls giggled and then walked across the room, holding on to each other. The jukebox was still shrieking. Couples danced without touching. The two girls pushed through the dancers, reached the table and stopped there, looked at Stanford and Gardner in turn and gave them broad, streetwise grins.

'Hi,' the blonde said.

'Peace on Earth,' Stanford said. 'We thought you might like to share a bottle with two honorable men.'

'Oh, Jesus,' the brunette said.

'Don't pray,' Stanford said. 'We don't hold with religion on Friday nights. Just set yourselves down.'

They both giggled and sat down. Up close they looked different. The blonde wore skin-tight jeans and halter, her tanned belly exposed, her breasts thrusting forward in sexual challenge, her nose upturned, eyes hard. The brunette was far heavier, less pretty, even harder, her loose dress hiding unwanted flesh, her face masked in thick makeup. Gardner looked suspiciously at them. He was probably thinking they were hookers. The girls flicked their eyes at Stanford, looked away, giggled again and then sighed in unison.

'I'm Joanne,' the blonde said. 'This here's my friend, Carol. We both live on the other side of the tracks. We've never been here before.'

'I'm Stanford,' Stanford said. 'This gentleman is Mr Gardner. He owns this place. We're both bored with the sound of our own voices and we thought you'd distract us.'

The girls giggled again. 'That's a shame,' Carol said. 'You guys seemed to

love one another. So *involved* with each other!'

'What were you talking about?' Joanne asked.

'UFOs,' Gardner muttered.

'*UFOs*?'

'Flying saucers,' Stanford said. 'Gardner's an expert.'

'Christ, they're creepy,' Carol said.

'Fantastic,' Joanne said. 'One of my favorite subjects. Are you *really* an expert?'

She stared straight at Gardner. Her blue eyes were like saucers. Gardner grinned and sat up in his chair, almost preening himself.

'I guess so,' he said.

'He's being modest,' Stanford said. 'This guy was chasing UFOs for the Air Force. He knows all about them.'

Joanne moved closer to Gardner, her breasts brushing against his arm, her blue eyes very large and excited, her knee touching his knee. Gardner couldn't resist it, acted more drunk than he was, putting his arm around the woman to hug her, grinning like an idiot.

'Tell her about the Lubbock Lights,' Stanford said. 'Give her all the details. If UFOs are one of her favorite subjects, she'll be fascinated.'

Gardner's dopey grinned widened. 'Okay, sweetheart,' he said. 'Let me give you a display of expertise that'll boggle your mind.'

Stanford poured them all drinks. Gardner drank and hugged Joanne. Carol, the brunette, shivered melodramatically and said, 'Shit, this is gonna be

creepy.' Joanne giggled and snuggled into Gardner's embrace. Gardner grinned at each of them in turn, then he started talking.

'The Lubbock affair began on the evening of August 25, 1951, when an employee of the Atomic Energy Commission's supersecret Sandia Corporation – one with a top "Q" security clearance – looked up from his garden on the outskirts of Albuquerque to see a huge aircraft flying swiftly and *silently* over his home. He later described it as having the shape of a "flying wing", about one and a half times the size of a B-36, with six to eight softly glowing bluish lights on the aft end of its wings. That same night, about twenty minutes after the first sighting, four professors from the Texas Technological College at Lubbock observed a formation of lights streaking across the sky: about fifteen to thirty separate lights, all a bluish-green color, moving from north to south in a semicircular formation… Then, early in the morning of the following day, only a few hours after the Lubbock sightings, two different radars at an Air Defence Command radar station located in Washington State showed an unknown target traveling at nine hundred miles an hour at thirteen hundred feet and heading in a northwesterly direction. But it didn't end there… On August 31, at the height of the flap, two ladies were driving near Matador, seventy miles northeast of Lubbock, when they saw a pear-shaped object about a hundred and fifty yards ahead of them, about a hundred and twenty feet in the air, drifting slowly to the east at less than the take-off speed of a Cub airplane. One of these witnesses was pretty familiar with aircraft – she was married to an Air Force officer and had lived near air bases for years – and she swore that the object was about the size of a B-29 fuselage, had a porthole on one side, made absolutely no noise as it moved *into* the wind, and suddenly picked up speed and climbed out of sight, seemingly making a tight, spiraling manoeuver. That same evening, an amateur photographer took five photos of a V formation of the same bluish-green lights as they flew over his backyard. And finally, a rancher's wife told her husband – who related the story to Captain Ruppelt – that she had seen a large object gliding swiftly and *silently* over their house. That sighting was made about ten minutes after the Sandia Corporation employee saw *his*

object, it was described as “an airplane without a body”, and the woman said that on the aft edge of the wing there were pairs of glowing bluish lights – the exact same description as the Sandia Corporation gave regarding his own sighting.’

‘Christ,’ Joanne said.

‘I don’t believe this,’ Carol said. ‘I mean, folks see things all the time. That’s not proof they exist.’

‘Well, listen to this,’ Gardner said. ‘We investigated all the Lubbock sightings thoroughly. First, we discovered that the Washington State radar lock-on was a solid target – not a weather target – and it was then easy to work out that an object flying between that radar station and Lubbock would have been on a northwesterly course at the time it was seen at the two places – and that it would have had a speed of approximately nine hundred miles an hour, as calculated by the radar. Next, we analyzed the five photos taken by the amateur photographer. The lights had crossed about one hundred and twenty degrees of open sky at a thirty-degree-per-second angular velocity – and that corresponded exactly to the angular velocity carefully measured by the four professors from the tech college at Lubbock. Analysis of the photos also showed that the lights were a great deal brighter than the surrounding stars and that their unusual intensity could have been caused by the exceptionally bright light source that had a color at the most distant red end of the spectrum, bordering on infrared.’

‘Jesus,’ Joanne said, ‘you sound like Einstein. What the hell does that *mean*?’

Gardner preened at her bewilderment, grinned at each of them in turn, then fixed his increasingly bleary gaze upon Stanford, now ignoring the ladies.

‘I think *you* know,’ he said. ‘Since the human eye isn’t sensitive to such a light, the light could seem dim to the eye – as many of the Lubbock lights did – but be exceptionally bright on film – as they were on our photos. And

according to the Photo Reconnaissance Laboratory, at those days there was nothing flying that had those particular, almost magical, characteristics. However, what *really* knocked us out was the discovery that the lights on the photos were remarkably similar to the description given by the Atomic Energy Commission employee of the lights on the aft edge of the huge UFO that passed over his house.'

'So,' Stanford said, leaning forward, '*did* something fly over Albuquerque and travel two hundred and fifty miles to Lubbock at a speed of about nine hundred miles an hour? And did the radar station in Washington State pick up that same object?'

'According to the witnesses,' Gardner said, 'and to our radar and visual tracking calculations, it did. Our Lubbock files were also studied by a group of rocket experts, nuclear physicists and intelligence experts, and they were all convinced that the Lubbock lights had to be of extraterrestrial origin.'

'Oh, God,' Joanne said, her eyes again like saucers, 'you hear that, they must be real. I mean, you hear that, they've *got* to be.'

'Shit,' Carol said. 'It's all shit. Let's talk about something else. What about sex?' She picked up her glass, had a drink, put the glass down, gave them all a look of mock disgust and then lit a cigaret, blowing smoke rings. Stanford smiled understandingly, reached out and stroked her cheek. 'Sex,' he said. 'I like the sound of that. I think we might even try it.' He sat back and smiled at her. His smile was returned. Joanne pouted in a theatrical manner and gave Gardner a hug. 'Just ignore them,' she said. 'I think it's really far out. I mean, you don't hear stuff like this every day. I feel kind of shivery.' Her breasts moved when she shivered. Gardner seemed a lot brighter. Stanford shrugged as if he didn't really care, but he topped up their glasses.

'I heard that the Pentagon was involved. Is that true, Mr Gardner?'

'Yeah, it's true,' Gardner said. 'Not many people know that. But the

Pentagon, no matter what you're told to the contrary, was involved all right. The Forth Monmouth sightings started it. All the witnesses were top brass. Those sightings caused a fucking sensation and really got the ball rolling. I mean, within hours of those sightings we received a call from the Director of Intelligence of the Air Force, Major General Cabell, telling us to get someone from the ATIC to Jersey immediately and find out what the hell was going on. Shortly after that call, the T-33 pilot and an Air Force major who had tried to pursue the UFO were on an airplane to New York where they were grilled by two of our best men. By the following day, our two men, Lieutenant Cummings and Lieutenant Colonel Rosengarten, were sitting down in the Pentagon, having words with Major General Cabell. Every word of that meeting was duly recorded – but according to our sources the recording was considered so hot it was later destroyed. No matter… Now totally convinced of the legitimacy of the UFO problem, Major General Cabell ordered the ATIC to establish a few UFO project. And since Cummings was due for release from active duty, Captain Ruppelt was put in charge of the operation. In April of 1952 Project Grudge was renamed Project Blue Book – and Ruppelt really took that project seriously.'

This was what Stanford wanted to hear. More importantly, it was what Dr Epstein wanted to hear, and Stanford had to deliver.

'Business,' Carol said. 'I'm fed up with all this shit. I think you two guys should make an offer. We've got a living to make.'

'Oh, for God's sake,' Joanne said, 'that can wait. I mean, we both need a break.'

'That's right,' Stanford said. 'Let's just keep drinking. Don't worry: Mr Gardner and I are here for the night – and we're not short of cash.'

Carol puckered her lips, glared at Joanne, then shrugged. Stanford quickly topped their glasses up, not forgetting Gardner.

‘This is amazing,’ he said. ‘I can hardly believe my ears. I mean, I never thought they took it that seriously. The Pentagon! *Christ*!’

He was stroking Gardner’s vanity and the response was immediate: Gardner removed his arm from Joanne’s waist and leaned toward Stanford.

‘Not only the Pentagon,’ he said. ‘The goddamned CIA, too.’

‘What?’

‘You heard me right,’ Gardner said. ‘By June of that year Project Blue Book was really going strong and had received more official reports than in any previous months of its history. In fact, the number of reports coming in at that time was fucking astonishing – and Air Force officers in the Pentagon became frantic. In July, the ATIC received over five hundred reports – more than three times the number received in June – and then, when one of the top dogs in the CIA – and most of his guests – saw a silent, vertically ascending UFO over his home in Alexandria, Virginia, General Samford, Director of Intelligence, called Ruppelt to a secret meeting in Washington DC. At that meeting you had General Samford, members of his staff, intelligence officers from the Navy and, according to Ruppelt, more than a few CIA officers. That was the first time the CIA officially stepped into the picture. It was also the start of all our troubles.’

‘You mean that’s when Ruppelt started getting screwed.’

‘Exactly,’ Gardner said. ‘What finally burst the balloon was the unprecedented number of July sightings, peaking in the famous UFO invasion of Washington DC in 1952. After that, it was murder.’

‘I’m filing my fingernails,’ Carol said. ‘I’ve nothing else to do. I’m sitting on my ass turning numb, so I’m filing my fingernails.’

Everyone glanced at her. She wasn’t filing her fingernails. Men and women were dancing close to the table and the jukebox was wailing. Joanne shook to

the rhythm, grinned at Stanford and winked. Stanford smiled, but kept his gaze fixed on Gardner, hoping to keep him pinned down.

‘That Washington sightings were incredible,’ he said, ‘but what went on in the background? I mean, what was the connection with Ruppelt? I think you said it affected him.’

‘Yeah,’ Gardner said, ‘it did. Ruppelt wasn’t in Washington during the night of the sightings, but he sure caught most of the flak. In fact, Ruppelt hadn’t even been informed of the sightings; he only found out about them when he bought a newspaper at the Washington National Airport Terminal Building when he got off an airliner from Dayton, Ohio. He rushed immediately to the Pentagon, where he had an urgent meeting with Major Dewey Fournet and Colonel Bower, an intelligence officer from Bolling AFB. They told him that throughout the night, the restricted air corridor around the White House had been filled with interceptor jets trying to chase UFOs, that the UFOs had been radar tracked all around Washington, that an analysis of the sightings had completely ruled out temperature inversions, and that the radar operatives at Washington National Airport and Andrews AFB – plus at least two other veteran airline pilots – had all sworn that their sightings were caused by the radar waves bouncing off hard, *solid* objects.’

‘So,’ Stanford said, ‘what happened to Ruppelt?’

‘On behalf of the Air Force, Al Chops gave the press an official “No comment” on the sightings. In the meantime, Captain Ruppelt had been trying to set up a thorough investigation, but was shafted wherever he turned. He planned to go all over the area, to every sighting location, but he hardly got his foot out of the Pentagon. First, he called the transportation section for a car – and was refused. Next, he went down to the finance office to see if he could *rent* a car – and was refused. Next, he was reminded that he was supposed to be on his way back to Dayton, and that if he didn’t leave he would be technically AWOL. Ruppelt gave up in disgust and returned to Wright-Patterson in Dayton.’

‘Are you suggesting that the Air Force deliberately got rid of their most experienced investigator?’

‘Well, what do *you* think it sounds like?’

‘Okay,’ Stanford said. ‘So within a week to the hour of the first major flap, a second UFO invasion took place over Washington DC.’

‘Correct. And this time it was even more impressive… At about thirty after ten on the evening of July 26, the same radar operatives who had seen the UFOs the week before picked up several of the very same objects… and this time the UFOs were spread out in an immense arc around Washington – from Virginia to Andrews AFB. In short, they had Washington boxed in.’

Stanford glanced at Carol and saw her filing her fingernails, but when he turned to the bare-bellied, blonde Joanne, he received an excited grin.

‘So,’ he said, ‘the White House took the invasion seriously.’

‘Damned right,’ Gardner said. ‘Throughout that night there was chaos in Washington. The press was furious because all reporters and photographers had been ordered out of the radar rooms at the time the interceptors were chasing the UFOs. However, once the press were gone, arguments really blew up in all those radar towers and in the Pentagon itself. According to Dewey Fournet, the Pentagon liaison man, everyone in the radar rooms had been convinced that the targets had been caused by solid, metallic objects and couldn’t possibly have been anything else. And whatever those things were, they could literally hover in the air, then abruptly accelerate to at least a couple of thousand miles an hour.’

‘Lord have mercy,’ Joanne said, looking even more excited. ‘And to think I actually read about those saucers! Is it true President Nixon actually saw them?’

‘It was 1952,’ the brunette Carol reminded her. ‘You’ve mixed up your

presidents.'

'Yeah,' Gardner said. 'When I was there, word came down the grapevine that President Truman himself had almost gone apeshit when he saw UFOs skimming right around the White House. That story was quickly squashed by some of the President's aides, but shortly after, about ten that morning, the President's air aide, Brigadier General Landry, called Intelligence at Truman's insistence to find out what the hell was going on. Ruppelt, having returned to Washington, took that call, but he had to hedge his answers because he couldn't explain the sightings at all.'

Carol opened her shoulder bag, dropped her nail file into it, then stared at each of them in turn, her lips puckered distastefully.

'I'm finished,' she said. 'My fingernails are like new. I'm sitting here, trying to make a living, but I'm getting no action.'

'Oh, *Carol*!' Joanne snapped.

'I'm just an ordinary working gal,' Carol said. 'I need to live, just like everyone else, but these two guys aren't helping me.'

'We have rooms,' Gardner said.

'I *know* that,' Carol retorted.

'Okay,' Stanford said. 'You have a deal. Just give us five more minutes.'

Carol sniffed and then nodded. 'Okay,' she said. 'As long as that's settled. I mean, we have other clients.'

Joanne smiled at Stanford. Gardner smiled at Joanne. Stanford winked at Joanne and then leaned forward, his eyes fixed on Gardner.

'What do think it all meant?' he asked.

Gardner sighed. ‘It was the Washington invasion, more than anything else, that made all of us at Blue Book a bit suspicious of the Air Force’s stance on UFOs. In fact, we spent over a year investigating those sightings, and what we came across really shook us. For a start, when the tower operatives at Andrews AFB were interrogated about the, quote, “large, fiery, orange-colored sphere”, unquote, that they had reported over their radio, they completely changed their story and said that what they had seen was a star – and that their mistake was due to their *excitement* at the time. Now, apart from the blatant idiocy of highly skilled radio operatives describing a normal star as a large, fiery, orange-colored sphere right over their control tower, Ruppelt also found out that according to astronomical charts there were *no* exceptionally bright stars where the UFO was reported to have been seen. Ruppelt then found out, from what he claimed was a reliable source, that the tower operatives had been *persuaded* a bit by their superiors. Likewise, the pilot of an F-94C, who had told us about vainly trying to intercept unidentified lights, later stated in his *official* report that all he had really seen was a ground light reflecting off a layer of haze – an equally ridiculous statement, since both the pilot and the radar had confirmed that the lights had repeatedly disappeared and reappeared in the sky before finally shooting away. Then, regarding the Air Force’s continuing stance that the lights had been caused by temperature inversions, we checked out the strength of the inversions through the Air Defense Command Weather Forecast Center – and at no time during the flap was there a temperature inversion remotely strong enough to show up on the radar. Finally, no weather target makes a one hundred and eighty degree turn and flies away every time an airplane reaches it. So the Washington DC sightings, according to Project Blue Book, are still unknowns.’

Stanford started to forget the girls. He felt a cold, clean excitement. He thought of Epstein in his office in Washington DC, waiting patiently to hear from him. Epstein had been right. The Air Force had covered up. Why they had covered up was a mystery that Stanford might yet solve.

‘As I said,’ Gardner continued, ‘it was the official reaction to the Washington DC sightings that made a lot of us suspicious of the Air Force. Too many people were telling us one thing and then changing their stories for their *official* reports. Also, it was becoming increasingly obvious that the top brass of the Air Force were trying to blind us with some dodgy maneuvers. After the Washington sightings, Ruppelt became convinced that pilots reporting UFOs were being intimidated into either changing their reports or simply remaining silent, that a lot of information was being withheld from Project Blue Book, and that the CIA was stepping into the picture for unexplained reasons.’

‘You were *really* worried about the CIA?’

‘Yep. The guy who worried us most during this time was General Hoyt Vandenberg. Bear in mind that it was Vandenberg who’d buried the original Project Sign Estimate of the Situation, who’d reportedly called us all mad, and who’d directly or indirectly caused the fear of ridicule that has ever since hindered all UFO projects. It was also because of Vandenberg that the Sign Estimate was incinerated and that Project Sign was insultingly renamed Project Grudge. Now, while none of us could be sure of just how much Vandenberg was influencing either the Air Force or the CIA, the knowledge that he had been head of the Central Intelligence Group – later the CIA – from June 1946 to May 1947, that his uncle had been chairman of the Foreign Relations Committee – then the second most powerful committee in the Senate – that Vandenberg obviously still had great influence in those areas, and that pressure was always coming from those areas to suppress knowledge of UFO investigations… well, all of that did nothing to make us trust him any more. If therefore came as no surprise when we heard that the CIA and some high-ranking officers, including Generals Vandenberg and Samford, were, against the objections of the Battelle Memorial Institute, convening a panel of scientists to analyze all the Project Blue Book data. And nor did it surprise us to discover that this panel was to be headed by Dr H. P. Robertson, director of the Weapons System Evaluation Group in the Office of the Secretary of

Defense – and a CIA classified employee.'

'What do you know about the Robertson Panel?' Stanford asked.

Gardner glanced at the two hookers, stared at Sanford, licked his lips, now excited and wanting to continue, but nervous of doing so. He glanced again at the hookers. Joanne smiled back. Carol had her chin in her hand, her lips puckered in boredom.

'I'm becoming impatient,' she said. 'I think you two are giving us a snow job. I don't think you intend taking us upstairs. A pair of fags, we've got sitting here.'

'I can't afford you,' Gardner said.

'It's on me,' Stanford said. 'I've got a pocketful of bread and I'm horny, so let's fix something up.'

'Jesus, thanks,' Gardner said. 'I mean, that's really decent of you. Tell you what… Send the ladies up to the room and then we'll finish our talk.'

'Oh, shit,' Joanne said.

'The rest of this talk is confidential,' Gardner said. 'I wanna finish this story with my buddy here, so just wait for us upstairs.'

'How long?' Carol asked bluntly.

'About ten minutes,' Gardner said.

'Here,' Stanford said, withdrawing some ten-dollar notes from his jacket pocket. 'It's a deposit. Just to give you a little confidence.' Carol took the money and pushed it into her shoulder bag. She stood up and looked down at Joanne and said, 'Okay, darlin', let's go.' Joanne sighed and stood up. 'What room?' she asked. 'We have to know the room number. We can't fuck in the

corridor.' Gardner told her the room number. He said the key was in the door. Carol sniffed, as if clearing her nostrils, and then walked away. Joanne grinned at both men, followed Carol across the dance floor; they both passed the howling jukebox and disappeared through a doorway beyond it. Gardner refilled his glass, had a drink and glanced around him, then he leaned across the table to get closer to Stanford.

'Okay,' he said. 'The only thing I really know about the Robertson Panel is that it was convened in secrecy in Washington DC in 1953, and that contrary to the evidence submitted by Project Blue Book it wrote a virtually negative report that led to the dissolving of our operation. First, the panel submitted its report to the CIA, the higher echelons of the Air Force and the Pentagon, but refused to give a copy to Ruppelt or any of the Blue Book staff. Next, Ruppelt and Captain Garland were summoned to CIA headquarters where it was explained to them that the Robertson Panel had recommended *expanding* Blue Book's staff and terminating all secrecy in the project. Naturally, this encouraged Ruppelt, but his pleasure turned sour when he discovered that the CIA had been lying to him. In fact, it later transpired that the Robertson Panel had recommended a *tightening* of security, a mass *debunking* of the phenomenon, and a subtle ridiculing of UFO witnesses and the phenomenon in general.'

Gardner studied his own busy bar. The room was smokey and packed. The jukebox was wailing in the corner, surrounded by dancers.

'So,' he said. 'When it became obvious that the CIA had lied to us and that the Air Force was in fact trying to strangle Project Blue Book, a lot of us at the ATIC became pretty nervous. Ruppelt himself began to feel that he was facing growing opposition from the Pentagon to his plans for expanding Blue Book's activities. This feeling was confirmed when he asked for a transfer but agreed to stay on with Blue Book until a replacement could be found. He had asked for that transfer in December '52, but by the following February no replacement had materialized. Nor were there any replacements when

Lieutenant Flues was transferred to the Alaskan Air Command, when Lieutenant Rothstein's tour of active duty ended, or when others on the staff either left or were transferred out. In short, Ruppelt departed from a drastically reduced Blue Book organization in February '53, and by the time he returned, in July of that same year, he found that the Air Force had reassigned most of his remaining staff, that they had sent no replacements, and that Blue Book now consisted of only himself and a mere two assistants. In other words, Project Blue Book had been fucked.'

'And you believe it was intentional?' Stanford said.

'Yeah,' Gardner said, 'it was deliberate. In fact, once Ruppelt left for Denver, it became clear to everyone involved that the Air Force had deliberately not replaced him because they wanted to strip Blue Book of its one remaining figure of authority. With no experienced officer in charge, Blue Book had little means of resisting the numerous transfers and subtle pressures that eventually strangled it. Of course, a few of us had tried to speak out against all that, but it was the worst fucking thing we could have done. More and more I saw guys getting harassed for no good reason, having their confidence shattered, their good records ruined, and then getting transferred out by way of punishment – or being asked to resign. That happened to me. Those fuckers just went out to get me. I started getting reprimanded for negligence, for dumb insolence and other shit, and then they started moving me around from post to post, from one dismal hole to another. Eventually, I gave up. I couldn't take it anymore. I was drinking like a fish, my wife packed up and left, and in the end, like a lot of the others, I just had to resign… You don't go too close to UFOs. It's a dangerous thing to do. If you go too close to UFOs you get burned – and you rarely recover.'

Gardner picked his glass up and finished it off with one gulp, then wiped his lips with the back of his free hand and glanced blearily around him.

'Christ, I'm drunk,' he said. 'I think I need a good fuck. I have to blow this out of my system. Let's go find those two whores.'

He stood up and swayed, grabbed the table and steadied himself, then Stanford stood up and took him by the elbow and turned him around. They pushed their way through the noisy crowd, passed the dancers near the jukebox, emerged from the haze of blue smoke and found the semi-dark stairs.

‘What happened to Ruppelt?’ Stanford asked. ‘You haven’t told me. You didn’t finish the story.’

Still swaying, Gardner started up the stairs. The drink had suddenly hit him hard. Stanford slid an arm around him and helped him up, wondering how his old friend had come to this.

‘I don’t know,’ Gardner said. ‘He just got fucked up like me. He came to see me shortly after he’d left the Air Force, and we drank beer and talked. His head was filled with questions. He couldn’t let the subject go. He had left, but the subject still obsessed him and kept him awake at night. He wondered what had gone wrong with Blue Book. He wondered why they had run it down. He wondered why the Air Force had played a double game – and he kept asking questions.’

They reached the top of the stairs. The corridor was short and dimly lit. Gardner coughed, sounding choked up, then lurched forward, swaying dangerously from side to side. Stanford grabbed him and turned him around and pressed him to the wall.

‘*What* questions?’ Stanford asked.

Gardner coughed into his fist. He stared at Stanford with bloodshot eyes. When he spoke, his voice was harsh and self-mocking, revealing his bitterness.

‘Why, when the Air Force was telling the whole world that the study of UFOs hadn’t produced enough evidence to warrant investigation, did they

secretly order all reports to be investigated? Why, when all of us had actually read General Twining's statement that the phenomenon was something real, did they deny that such a statement had ever been submitted? Why, when they themselves had initiated Project Sign and received its official report concluding that the UFOs were of extraterrestrial origin, did they dissolve the project and then burn the report? Why, when Project Sign was changed to Project Grudge, did they go all out to ridicule the reported sightings and then disperse most of the staff on that project? Why, when the Air Force continued to claim that they had absolutely no interest in UFOs, did they insist that all reports be sent to the Pentagon? Why, when Lieutenant Cummings and Lieutenant Rosengarten discussed UFOs in the Pentagon with the Director of Intelligence of the Air Force, was the recording of that meeting destroyed? Finally, why did the CIA lie to Ruppelt, why was the Robertson Panel report kept from him, and why was Project Blue Book run down? Those questions haven't been answered.'

Stanford opened the bedroom door. The light beamed out into the corridor. The two hookers were sitting up on the bed, drinking more bourbon and giggling. The room was small and shabby. The double bed was unmade. Stanford pushed Gardner in, shut the door with a bang, then turned and went back along the corridor until he came to the stairs. He stood there a long time. The bar below seemed faraway. The semi-darkness was alive with possibilities and strange, formless mysteries.

'Why?' Stanford asked.

CHAPTER FOURTEEN

‘Why?’ Epstein asked. ‘We always come back to “Why?”. There are too many contradictions and ambiguities. We have to know a lot more.’

Stanford sighed and nodded wearily. The Caribbean sun stung his eyes. He glanced back at St Thomas, at the bubbling white wake of the boat, feeling the deck trembling under his feet, hearing the engine’s dull rumbling.

‘I haven’t finished yet,’ he said. ‘That Gardner was just the start. I have an old CIA friend in DC and he’s promised to talk to me.’

‘He’s still in the CIA?’

‘You’ve got to be kidding. No, he left about ten years ago… but he was pretty high up there.’

‘I want to know more about Ruppelt. I want to know what happened to him. I want to know what the Robertson Panel actually said behind closed doors. I want to know who was on that panel. I think that’s fairly important. I want to know who they were and I want to know their precise recommendations. We were wrong about the Air Force. We’ve been fooled for twenty years. The Air Force and the CIA and the Pentagon have been involved, and that involvement has been kept under wraps. I want to know why.’

‘This friend was in on it,’ Stanford said. ‘He assured me of that much. He said there were strange things going on and that they hadn’t made sense to him. He’s willing to talk. He’ll pick up where the tapes left off. I’ll go see

him as soon as we get back and then give you a transcript.'

Stanford glanced around the ferry. There weren't many passengers on board. He saw a blonde-haired Dutch girl with the brown skin of a *vahine*, a couple of dusky workers arguing loudly in Creole French, a few American holidaymakers, gesticulating excitedly, snapping pictures, and a black woman of African descent selling mangoes and pineapples. They were all framed by the sea, which was calm, a dazzling blue, sweeping out to the cays and islets of the American Virgin Islands, their rolling hills blue-gray and parched green, a few clouds in the silvery sky.

'This is some place,' Stanford said.

'What did you think of St Thomas?'

'It looked like 42nd Street.'

'You should know,' Epstein said.

Stanford squinted against the sun. 'Is that the hotel?' he asked. He was looking at a sprawling, white-painted complex dominating an islet.

'That's it,' Epstein said.

Stanford nodded and turned around, leaned against the iron railing, let the trade winds blowing in from the northeast drying the sweat on his face. His gaze fell on the black woman, selling her fruit from a woven basket. She was wearing a white blouse and a skirt, a colorful apron over the skirt, and had a bright orange turban on her head, her black hair piled up under it. Stanford kept looking at her. She saw him staring and smiled back. She had laughing brown eyes, a sort of innocent sensuality, and he thought immediately of the girl on the porch of the ranch outside Galveston. He thought a lot about that girl and still couldn't understand it. He thought about that girl night and day, and was becoming obsessed with her.

‘Remember Galveston?’ He said.

‘Could I ever forget it?’ Epstein replied.

‘I’m thinking of going back there,’ Stanford said. ‘I want to talk to those people.’

‘That was a year ago.’

‘So, it was a year ago.’

‘That’s a pretty long time,’ Epstein said. ‘You won’t do any good.’

‘Why do you say that?’

‘They wouldn’t talk when we were there. The old man was possibly mad and the girl was dumb. I don’t think they’ll talk now.’

‘I don’t care,’ Stanford said. ‘I want to try anyway. I want to know what those people really experienced, and this time I’ll push harder.’

‘The Army might still be there.’

‘I don’t think so,’ Stanford said.

‘Okay,’ Epstein said, ‘please yourself. We have nothing but time.’

Epstein’s gray hair was being blown by the breeze, his jacket draped over his left arm, his grubby tie hanging loose. He had aged a lot in the past year, had thinned down and was coughing more, the lines on his face more predominant, his movements slow and exhausted. Stanford had noticed the change. It had begun with Irving’s death. Dr Epstein now looked his true age and was shrinking each day.

Stanford was also changing, was more tense, less ebullient, now driven by forces beyond his comprehension, seduced by riddles and mysteries. He

thought constantly about the flatlands, about the lights in the sky, about the dust and the wind and the butchered cattle and the girl on the porch. Stanford couldn't understand it. It was much more than sex. He had thought about the girl for a year and now she seemed to be part of him. There was something unreal about it. He felt as if the girl was calling to him. He was losing track of time, losing touch with reality, and often felt that he was trapped in an eternal present, still blinded by dust clouds.

Life was an illusion. He believed that more and more. He had pursued the invisible for too long and now was paying the price. Nothing seemed real anymore, nothing here, nothing immediate; his sole reality was a night of wind and dust and strange lights and masked men. What did it all mean? Why was he now so driven? Stanford glanced around the ferry, saw the faces black and white, the blue sea and cays and islets that burned under a white sun. He felt hot and suffocated, almost dissolving where he stood, and he turned toward the prow of the boat as it approached the small island.

'That's some hotel,' he said.

'It collects the vacation crowds.'

'It looks like an old Moorish castle.'

'A touch of Hollywood,' Epstein said.

The ferry was nearing the island, heading straight for the rocks, then it turned and drifted toward a wooden dock and then bumped alongside it. One of the crew jumped off the boat, started tying the ropes to rusty bollards, while Stanford gazed up the climbing, parched land to the walls of the hotel. The walls were whitewashed and gleaming, broken up by Moorish arches, rising up in tiers above a swimming pool and lined with exotic plants and flowers. It was a single-storey building, sprawling across the upper slopes, dominating the sunbleached, rocky island with serene grandiosity. The ferry bumped against the dock. Crew members put the gangplank down. Stanford looked

along the dock, saw a bus and some cars, a few people milling about in drifting dust, examining the disembarking passengers.

‘Is he there?’ Stanford asked.

‘Yes,’ Epstein said. ‘The man in the sports shirt and shorts.

‘They’re *all* dressed like that,’ Stanford said.

Epstein nodded and smiled, watched the passengers disembark, waited until the last ones had stepped off the ferry and then followed them down. He walked slowly and carefully, as if not sure of his footing, gazing down past the gangplank at the water which eddied and rippled. Stanford followed him down, glancing keenly around him, as the crystal-clear blue of the sea, the green islets, the silvery sky. The heat was incredible. The air shimmered before his eyes. He stepped onto the wooden dock, following Epstein’s stocky form, and a short man wearing a sports shirt and shorts stepped forward to greet them.

‘Long time no see,’ he said to Epstein. ‘You look pretty tired.’

The man was short and too fat, his shirt loosened around his belly, white hair blowing over bright green eyes and a tanned, good-humored face. He and Epstein shook hands, exchanged a few jocular pleasantries, then Epstein introduced Stanford, who also shook the man’s hand.

‘Robert Stanford,’ Epstein said. ‘I just call him Stanford. The name has a certain crass elegance that suits him quite well. Stanford, this is my good friend, Professor Tom Gerhardt.’

‘You’re still young,’ Gerhardt said to Stanford.

‘Is that surprising?’ Stanford asked.

‘I suppose not,’ Gerhardt said with a grin. ‘I just didn’t expect it.’ He waved

his hand airily, indicating the whole island. ‘How do you like it?’ he asked.

‘A good place for a vacation,’ Stanford said.

‘That’s what *I* thought,’ Gerhardt said.

Epstein glanced up at the hotel, located at the top of the steep hill. ‘Do we have to walk up?’ he asked.

‘No,’ Gerhardt said, pointing at the dusty Volkswagen Beetle parked behind him. ‘I didn’t think you’d make it that far, so I brought my own transport.’

The other passengers were boarding the hotel bus that was parked just beyond the Volkswagen. The car and the bus were both parked on a tract of flat earth that overlooked the gently rippling azure sea. Beyond the bus, across that broad expanse of clear blue water, was St Thomas and the capital, Charlotte Amalie.

‘I come here every year,’ Professor Gerhardt said. ‘I come because there’s nothing to do here and that suits me fine… At least it did until *this* year.’

He opened the door of the Volkswagen and pulled the front seat forward. Stanford scrambled into the rear, resting his overnight bag on his knees, and sat there, bunched up in the cramped space, feeling uncomfortable. Gerhard sat in the driver’s seat and Epstein sat beside him, slamming the door as the car coughed into life and started up the steep hill. The road snaked around the islet, climbing toward the hotel on its summit, passing coco palms and divi-divi trees and tracts of parched, windblown grass. Stanford looked out the window. The sea was spread out far below him. He saw the cays and scattered islets, the sea blue and sun-reflecting, motor launches racing around coral reefs, helicopters above them. Then the Volkswagen reached the hotel and spluttered into silence, stopping between dazzling white walls and high, white-washed arches.

‘Home sweet home,’ Gerhardt said.

He opened his door and clambered out, pulled the seat up for Stanford, and the latter, pushing his bag out ahead of him, emerged gratefully onto the driveway. Epstein clambered out the other side, slung his own bag over his shoulder, stretched himself, nodding his head in appreciation, and then grinned at Stanford.

‘The one advantage about this job,’ he said, ‘is that a man gets to travel.’

‘It’s damned hot,’ Stanford said.

‘It’ll soon become cooler,’ Garhardt said. ‘The sun will go down in an hour or so; then you’ll feel a lot better.’

‘We’d better check in,’ Epstein said.

‘I booked two rooms the minute I received your cablegram confirming that you could come, so you just have to pick up your keys. Now do you want to go immediately for a rest or would you rather we talked first?’

‘I could do with a drink,’ Stanford said.

‘We’d better talk straight away,’ Epstein said. ‘We’ll be leaving first thing in the morning, so let’s go to the bar.’

‘Have you eaten?’

‘No.’

‘Then let’s eat,’ Gerhardt said. ‘I’ll tell you the whole story over a meal, and then you can sleep on it.’

They left their bags at the reception desk, collected their room keys, then were led by Gerhardt across a cobbled courtyard, emerging into the gardens. He then led them up some steps, across a cool, covered patio, and finally into an open-air restaurant overlooking the sea. The restaurant looked like an

expansive terrace, its white walls strewn with flowers. Lanterns dangled from the ceiling, glowing red, green and yellow, though their light was rendered redundant by the sunlight pouring in over the verandah wall. Gerhardt sat them on the verandah, at a table against the low wall, and Stanford looked down to see the parched earth falling away to a crowded swimming pool. There was a bar by the pool. Girls in bikinis and men in swimming trunks were drinking fancy cocktails. Beyond them their distant, shadowed figures was the sea and the crimson sinking sun.

‘Apart from fish,’ Gerhardt said, ‘I couldn’t honestly recommend the menu. Most of the food in the Caribbean comes in cans. Only the fruit and the fish are fresh.’

‘I’ll have lobster,’ Epstein said.

‘Crayfish,’ Stanford said. ‘And I’ll start with a very tall rum and Coke to make myself feel at home.’

‘I’ll just have a cold beer,’ Epstein said.

Gerhardt ordered for them. Over the meal, he and Epstein talked about old times, when they had both been young, fresh-faced physicists working at a variety of government-sponsored research establishments in the White Sands Proving Ground, New Mexico, before going their separate ways, Gerhardt to the Cheyenne Mountain Complex in Colorado, Epstein to his UFO work for the APII. Stanford studied Gerhardt carefully. He liked the man a lot. Gerhardt had a sense of humour, a natural openness and ebullience, but beneath his spontaneity was a tension that was finely suppressed. And although he talked a lot, he didn’t mention why he had called them to the Caribbean until they had all finished eating. The sun was going down by then. The sea resembled flowing lava. The islets dotting the crimson water were casting shadows that undulated and deepened. Gerhardt sat back in his chair. A yellow lantern shone its light into his eyes. He sipped his beer and glanced uneasily around him and then focused on Epstein.

‘All right,’ he said. ‘So why did I ask you to come and see me?’

‘I’m dying to know,’ Epstein replied.

‘As you know, I’m still working for NORAD in the Cheyenne Mountain Complex.’

‘Yes.’

‘Well, for the past year things have been going haywire there: computers malfunctioning, data cards disappearing, the printouts from our worldwide network of radar stations coming in either erratically or not at all. Even worse: we have quite a few spy satellites whose sole purpose for being is to photograph the Semipalitinsk laboratory in Russia, where we believe they’re creating some extraordinary pulse beam weapons. So, what happens? Our damned satellites start malfunctioning. A couple get knocked out of the sky – we don’t even know where they went – and the rest take their turn in malfunctioning in inexplicable ways. We don’t know what’s happening. We just can’t pin it down. We’ve checked the whole complex from top to bottom, but we can’t find a fault.

‘Okay, so I’m in trouble. I’m supposed to be in charge of the data input. Eyes are aimed suspiciously in my direction and my nerves start twitching. I should *know* what’s causing the problems – it’s my field; my speciality – but I’m sitting there in the Operations Center, just chewing my fingernails. I haven’t a goddamned clue, I can’t find a single reason, and now I’m being checked out by the FBI and my credibility rating is zero.’

‘This all started a year ago?’

‘That’s right, Epstein: a year ago.’

‘Have you taken on any new staff since then?’

‘Not one. They’re all old hands with top security clearances.’

‘Okay, continue.’

‘Right. Now listen to this. For the past three months or so this has all been getting on top of me: my nerves playing up, too many sleepless nights, sweating and trying to work out my problems and then just sweating even more. Then I get a phone call. It’s from a guy named James Whitmore. He says that he works for ACASS, that they’ve heard I’m having a bad time, and that they want me to work for them in Europe and will pay me a lot. I tell him to put it in writing. He says he can’t do that. He says that I’m to meet him in a certain hotel for a drink and a talk. I tell him I’m not interested. He becomes very insistent. I get angry and tell him to shove off, but that just makes him chuckle. Things won’t get better, he says. Things will only get worse at NORAD. He says that he’ll get me sooner or later, then he chuckles again and hangs up.’

Gehrard sipped some more beer, then sighed and looked over the low, flower-strewn wall at the sun’s dying rays.

‘I started worrying about that call,’ he said. ‘It seemed an odd way of approaching a scientist. I also wondered how ACASS, a European-based commercial company, could know about the problems we were having in our top-secret establishments. So, I called ACASS. I rang their personnel manager. He said that he hadn’t heard about me, that he hadn’t planned to offer me a job, and that they didn’t have a Whitmore on their staff and that I’d just had my leg pulled.’

Gerhard picked up his glass of beer, studied it distractedly, then placed it back on the table and started drumming his fingers.

‘I couldn’t forget that guy,’ he said. ‘I wondered who he might be. If he knew about my problems, he either worked right there with me or had a friend planted in NORAD, passing back information. I told this to the FBI. They ran a check, but came up with nothing. They thought it might be a practical joke – a silly and dangerous practical joke – and they told me to keep my eyes on

my own staff and then report my suspicions. I just couldn't accept that. None of my staff are that dumb. I thought recalled what the guy had said – that he would get me sooner or later – and I couldn't shake that statement from my head and my nightmares increased.'

'Do you mean nightmares literally?'

'I mean a nightmare is a nightmare is a nightmare – and that's what I was having.' Gehardt sat forward in his chair, his face ghostly in the yellow light, the lanterns glowing brighter in the deepening darkness, the restaurant filling up. 'What happened next was really strange,' he said. 'First, my wife's at home on her own one day when she hears an unexpected knock on the door. She opens it to find these three guys on the porch, all dressed in dark suits, businesslike, all extremely polite. These guys then start taking turns at asking my wife various questions: Is she the wife of Professor Gerhardt? Is Professor Gerhardt at home? When would be the best time to come and see him? And so on and so forth – all very polite, but insistent. My wife is unnerved. She asks the men who they are. They say they're from the Federal Bureau of Investigation, but that's all they can tell her. Then my wife gets angry and demands to know what they're after. At that, they just nod their heads, back away to a waiting limousine, climb in and then drive off down the street… My wife tells me all about this and I start wondering what's going on. I have a friend in the FBI, he's a hundred percent loyal, so I call him and ask him to check it out and he tells me he will. He calls me back the next day. He says the CIA are worried about the foul-ups in NORAD, but neither they nor the FBI sent men around to my house. This turns out to be true. We have a visit from the FBI. They spend a couple of hours grilling my wife, trying to find out if she knows more than she's telling, if she actually knows who those men were. Naturally she insists that she told the truth and that she hasn't a clue who the men were, so finally, reluctantly, they leave her in peace. Though she was – and remains – badly rattled.'

Darkness had fallen. The stars were glittering like diamonds. The restaurant

was nearly full, the clientele elegantly dressed, and the lanterns glowed red, green and yellow on blond hair and bronzed shoulders.

‘That was the first thing,’ Gerhardt said. ‘It wasn’t to be the last… Three days later I get another phone call. It’s from Mr Whitmore again. He asks me if I’m willing to reconsider his previous offer. I don’t mention my call to ACASS. I’m too confused to think about it. I ask him if he knows about the men who dropped in on my wife. The bastard just chuckles. I demand to know who he is. He replies that he’ll get me pretty soon, then he chuckles again and hangs up… The next night it’s even worse. I’m on my way home from work. The car abruptly cuts out, its headlights go out, and I’m stranded in the middle of the desert wondering what the hell’s happened. Then I see three men. They’re walking along the road toward me. It’s so dark I can’t make out what they look like, but they’ve definitely advancing in my direction. I look beyond them and see nothing. I’m trying to work out where they came from. They come closer and they’re wearing coveralls, but I can’t see their faces. Then I’m really frightened. I suddenly panic. I try to start the car and nothing happens and I just can’t believe it. I look at the men again. They’re very close to the car. I look behind me and see another car coming out of the distance. Then I hear a strange noise. I turn back to the front. The three men have disappeared and then the other car passes and my own car starts up again… I didn’t touch the ignition. I didn’t do a damned thing. The car just started and I put my foot on the gas and drove home like crazy.’

Gerhardt sat back in his chair. The shadows fell across his face. Epstein and Stanford glanced at one another, neither saying a word. The darkness was now complete. The stars glittered in lonely splendour. The restaurant was noisier, a steel band played calypso, and the lanterns glowed red, green and yellow on the flushed, happy faces.

‘I was frightened,’ Gerhardt said. ‘I still can’t forget that night. Shortly after, the nightmares began – one nightmare each week. That’s how they came. They were as regular as clockwork. Every Wednesday, the same night every

week, I would have the same nightmare. The car broke down on a Wednesday. Every Wednesday I'd relive that. The dream would always end just as the three men were about to reach me and my wife would have to shake me awake to cut short my screaming.'

Gerhardt glanced uneasily around him, his face bathed in the yellow light, a white Moorish arch behind his head, the sea beyond that.

'That's why I came here alone,' he said. 'I just had to get away. I was hoping that if I came here I'd relax and the nightmares would stop.'

'But they didn't,' Epstein said.

'No,' Gerhardt said. 'Instead, I start having them every night… and then something else happened.'

'Three days ago.'

'Right.'

'That was Wednesday.'

'Right. It happened at midnight every Wednesday and it scared the shit out of me.'

Stanford glanced over the low wall, looking down on the swimming pool, to see the water reflecting the string of lanterns that were strung up around it. The bar down there was now closed. There was only one person left in the pool. It was a girl in a red bikini, swimming gracefully and down, her long blonde hair trailing out behind her like ribbons of gold. Stanford turned back to Gerhardt. He was leaning across the table. His green eyes were slightly obscured by the yellow light that flowed out of the lantern.

'I couldn't sleep that night. I was just lying on top of the bed. It was hot and the room was pretty bright because of the moonlight. Then the moonlight

disappeared. It just seemed to blink out. The room was plunged into darkness and I looked through the window and I couldn't see a star in the sky. That sky was pitch-black. I couldn't see a thing out there. I couldn't see the walls of the room, and then it suddenly turned cold. Then the fear came. I remembered my nightmare. The fear increased and I tried to sit up, but I couldn't move a muscle. That really terrified me. I was completely paralyzed. I tried to scream, but I couldn't make a sound and I seemed to be freezing. Then suddenly there was light. It poured in from the balcony. The doors opened and two figures came in and advanced straight to the bed. I couldn't see them very well. They were silhouetted in the dazzling light. They were wearing one-piece suits, were no taller than five feet, and their heads were tilted toward me, looking at me, neither saying a word. I just lay there, paralyzed. I'd never known such fear before. I just lay there and watched them as they walked up to the bed, as one started leaning over me, his hand reaching out to me. He pressed something against my neck. It was cold and then it burned. I tried to scream, but I couldn't make a sound, and then the pain, the burning, went away. I stared up at the two men. I couldn't think through my fear. Both men made a little bow, a kind of curtsy, and then they walked from the room. "Saturday," I thought. I thought one of them said "Saturday". I don't believe they said anything at all, but that word filled my head. Then they were gone. There was a strange vibrating sound. The light from the balcony blinked out and the moonlight returned. I remember the moonlight. I remember wanting to sit up. I fell asleep and I didn't have dreams and I awakened refreshed. Then I went to the mirror. I examined myself. There was an ugly red scar on my neck where that man had touched it with something. That scar has gone already. Maybe it never really there. But I don't feel any fear anymore… I feel an odd, calm elation.'

Stanford studied Gerhardt's eyes, thought of the girl on the porch of the ranch near Galveston, shivered and then turned his head away and looked down at the swimming pool. The blue water reflected the lanterns. The golden girl had disappeared. The pool was a rectangle of light in a vast, starlit darkness. Stanford turned his gaze on Epstein. The old man scratched at his beard.

Stanford returned his gaze to Gerhardt, saw the green eyes in yellow light, and he thought again of the girl on the porch and felt the mystery deepening.

‘This is Saturday,’ Stanford said.

‘That’s right, Dr Stanford. This is Saturday and I’m talking to you and I don’t feel a thing.’

‘Anything else?’ Epstein asked.

‘Yes, there’s something else. I feel that something’s going to happen tonight, and I believe it concerns you.’

Epstein scratched at his beard, glanced thoughtfully around him, saw the diners at the other tables, couples dancing on the stone-slab floor, the silk shirts and snap brims of the Trinidadian band members , the colored lanterns swaying in the breeze that trickled through the restaurant.

‘Why call us?’ he asked. ‘There must be more than that.’

‘There is,’ Gerhardt said. ‘There’s something else… and it’s right up your street.’ He leaned farther across the table, his chin propped up in his hands, his green eyes diffused in the yellow light, the white arch behind him. ‘There’s an English film crew here,’ he said. ‘They’re making a movie about Captain Cook. Now the morning after the incident I was talking to their stills photographer, a young guy who was looking pretty stunned. He knew I worked for the government, that I was some kind of scientist, so he thought I was the best man to talk to. Apparently, the night before – about the same time I was having my little experience in my room – he had been down on the beach trying to take some low-speed shots in the moonlight. He was taking some pictures of the movie’s replica of Captain Cook’s ship, the *Endeavour*, and he managed to shoot one roll in color. Now, the next morning, when he developed that film in his room, he was startled to see what appeared to be a very large, blurred, milky-white, disk-shaped object

hovering in the night sky above the boat. What really stunned him about this was his conviction that at no time during the shooting of those pictures had he seen anything but stars in that sky. He was absolutely convinced of this. He was willing to swear to it. And yet that huge disk-shaped object was in nine of his thirty-six pictures, a little higher up in each single picture, finally cut off by the top of the frame in the very last one.'

Stanford glanced over the wall, saw the dark sea and sky, the stars glittering above the gliding moon, a few clouds drifting languidly. He then looked at Gerhardt's eyes, recalled the girl on the porch, remembered the lights in the sky and felt a chill passing through him.

'Any estimation of size?' Epstein asked.

'Pretty rough,' Gerhardt said. 'Judging by the land behind it, and by the boat just below it, we both thought it was at least a hundred feet wide – but we couldn't be sure of that.'

'What was the duration between each of the pictures?'

'I've no idea.'

'Anything else in the photographs?'

'No. There was just a sort of glowing around the disk. The disk itself was quite blurred.'

Stanford knew what was coming. He looked directly at Epstein. The restaurant behind Epstein was busy and romantically lit. The lanterns glowed with different colors, candles flickered on all the tables, and the musicians on the small stage were excited, sweating over their instruments. The whole scene was enchanting, was too good to be true, so Stanford turned his gaze back upon Epstein, knowing what he would say.

'We'll have to stay,' Epstein said. 'I think we should hang around here for a

while. I seriously doubt that anything else will happen, but you just never know. I also want to talk to that photographer. I want copies of all his pictures. I want the photographer to take me down to the beach and show me just where he was standing when he took those photos. So I guess we'll just have to stay on.'

Gerhardt slumped into his chair, spread his hands and shook his head, then leaned forward again and looked right at Epstein, his green eyes very bright.

'That's the whole point,' he said, almost whispering. 'The photographer's vanished.'

The rain started just before midnight, splashing in thick drops on the verandah outside Stanford's room and making him open his eyes. There was a distant clap of thunder. The verandah doors rattled. Stanford cursed and glanced around the silent room and saw the white walls in darkness.

The thunder rumbled again. The rain fell more heavily. The doors rattled and Stanford stared at them, feeling strangely uneasy. The doors were still closed. The shutters revealed no moonlight. The thunder rumbled and the doors shook and rattled while the rain poured down heavily. Stanford thought he heard the sea, a muffled sound far below, the waves rushing in and washing over the rocks and then poured back out again. It was an unexpected sound; he hadn't anticipated such weather. He closed his eyes and tried to fall asleep and thought again of the girl.

Stanford groaned aloud. He opened his eyes to see the ceiling. There was a wooden fan spinning above his head, casting cool air down upon him. He heard the rain on the verandah, falling even harder now. The thunder rumbled and the double doors rattled as if being pushed open. Stanford felt strangely nervous, unreal, disorientated, trying to sleep and thinking only of the girl… and of Gerhardt's green eyes.

'Godammit,' he muttered.

He closed his eyes and saw the girl. Her luminous gaze drew him in. He saw the thumb between her lips, the breasts thrusting against her dress, the triangle of her thighs and shadowed crotch, her belly pressed to the windowsill. Stanford felt himself hardening. He saw Gerhardt's green eyes, filled with fear and an odd elation, and he cursed and sat up on the bed and shook his head in despair.

The room was very dark. No moonlight came through the shutters. Stanford wondered what was happening, though of Gerhardt's fearful calm, then thought of the girl on the porch and of her empty, revealing gaze. She had Gerhardt had something in common: an unnatural calm, a sheltered secret; they had both seemed like people not quite real, couched in awed expectation. What had they both experienced? What dreams did their eyes conceal? Stanford sat up very straight and stared around him, seeing white walls in darkness.

Suddenly, he felt frightened. He hadn't felt that before. The thunder rumbled and the double doors rattled as if being pushed open. Stanford shook his head disgustedly, stroked his own face, rubbed his eyes, than reached out and switched on the light and sat back with a sigh.

Then he heard the footsteps. They were advancing toward the main door of the room. He stiffened as if he had been stung, and just looked straight ahead. The footsteps stopped outside the door. He felt his throat drying. He held his breath and kept looking at the door and tried to hold his fear down.

'Stanford?' Knuckles hammered on the door. 'Are you still awake?'

Stanford exhaled his breath, took it in again, sighed again, leaning his head back on the pillow and feeling very relieved.

'Yes, Epstein, I'm awake.'

'Can I come in?'

‘Why not?’

The door opened and Epstein entered.

‘I saw the light under the door,’ he said. ‘I couldn’t sleep either.’

He was wearing an old dressing gown, frayed at the edges, obviously purchased about 1955 and now far too tight for him.

‘I brought a bottle,’ he said.

‘So I see,’ Stanford said.

‘I thought you might be able to do with a drink… keep the rain from your doors.’

Stanford grinned at that, swung his legs off the bed, rubbed his eyes and then looked at the rattling doors.

‘That’s some storm,’ he said.

‘It certainly is, my friend. I’m wondering if there’s any connection. Where are the glasses?’

‘Why a connection?’

‘We can’t drink without those glasses.’

‘You’ll find a couple in the bathroom. Now why a connection?’

Epstein went into the bathroom, returned with two glasses, unscrewed the bottle of Scotch and poured two stiff shots.

‘Here,’ he said, passing one to Stanford. ‘It’ll settle your nerves.’

Stanford took the glass from him. ‘What makes you think I’m nervous?’

‘Aren’t you?’

‘Yes.’

‘So am I. That’s why I’m here.’

They both sipped their Scotch. Epstein sat in a bamboo chair. Stanford remained on the edge of the bed, observing the rattling doors.

‘You think there’s a connection?’

‘There might be,’ Epstein said. ‘This storm just blew up out of nowhere – and it’s uncommonly violent.’

‘You’re thinking of Galveston.’

‘We’re *both* thinking of Galveston.’

Stanford had another sip of Scotch. ‘I feel weird,’ he said quietly.

The thunder rumbled again. They heard the crackling of lightning. The rain poured down on the verandah, whipped across by a howling wind, the wind making the double doors rattle, trying to push them both open.

‘How’s Gerhardt?’ Stanford asked.

‘I think he’s sleeping,’ Epstein said. ‘I had a look before I came here. His room lights were turned off.’

‘There’s something odd there,’ Stanford said.

‘You think so? I hadn’t noticed.’

‘I’m thinking of his conversation. He said the experience terrified him. A minute later, he said he felt nothing, and then he said he felt elated. Those are contradictory words. His expression was also contradictory. His eyes were

very bright, very eager and excited, yet the rest of his face was tense with fear… It doesn't really add up.'

'Is that what you saw?'

'It's what I *think* I saw.'

'He seemed calm when he went into his bedroom.'

'He seemed *unnaturally* calm.'

Epstein sipped some Scotch, his gray gaze roaming restlessly. 'Maybe you're right,' he said eventually. 'I *did* think he was a bit odd. I couldn't quite put my finger on it, but, yes, he was *too* calm. Given the nature of his experience, he should be more concerned than he is. And that was a pretty strange story he told. He mentioned Saturday night. That's tonight, Stanford.' Epstein drank some more Scotch, splashing a little on his wrist. 'I would love to have seen those photos,' he said. 'I wonder where that photographer went.'

'It's interesting,' Stanford said. 'I was thinking about it later. The photographer said he didn't see a thing when he was taking the pictures. I got to thinking of Gardner. He mentioned a similar case. I think he was talking about the Lubbock lights and the photographs taken at that time.'

'That's right,' Epstein said. 'It was definitely the Lubbock photos. Gardner said that what the photographer picked up was an exceptionally bright light source that had a color at the most distant red end of the spectrum. That means it was infrared – or something similar to infrared. That in turn means that the object would seem dim to the human eye but be very bright and clear on a photo. It's an interesting possibility. That's what we could have here. That disk could have been solid, giving off infrared light, and thus would have become invisible to the photographer while coming out on his photos.'

'Take it further,' Stanford said. 'Go beyond the known spectrum. If those objects could produce such a light, if they could produce it at will, that would

explain why they could materialize and disappear in the wink of an eye.'

'It's possible,' Epstein said. 'It's within the bounds of probability. The UFOs are usually described as being surrounded by *glowing* colors: blue, green, yellow, orange, red. Assuming that we're dealing with a metal composed of already known elements – possibly of unusual purity and radical mixtures, but known elements nevertheless – that we can also assume that what we are *not* dealing with is a magical metal that can actually transmit light.'

'I'll buy that.'

'Thank you.' Epstein cocked his ear to the distant thunder, shivering when the double doors rattled. 'So,' he said. 'Electrical discharges of unusual strength will sometimes lead to a soft white glow, a corona, near high-voltage transmission lines. This leads one to assume that our UFO may have either some sort of negative potential that causes electrons to leak into the atmosphere surrounding it, an alternating potential that agitates gas atoms in the surrounding atmosphere to their ionization potential, or even an alternating current within its own shell, which draws energy from that same surrounding atmosphere.'

'A neat theory,' Stanford said. 'But that only accounts for a *white* glow.'

Epstein smiled. 'Very true. However, what we're now assuming is that the UFO's luminosity is not caused by its own unique composition, but by the natural air closely surrounding it. Let's now bear in mind the fact that if atoms are sufficiently agitated by the absorption of electromagnetic radiation, a few of their electrons will be elevated out of their normal orbits or possibly removed from the atom completely; then, as further electrons fall back into these empty spaces, a certain amount of energy will be released and radiated away as photons. That being said, I need only point out that within the visible region a stream of such photons having the same wavelength and frequency will be seen by the human eye as an unusual, glowing color, ranging all the way from violet to red.'

‘Electromagnetic radiation?’

‘It fits in with our trace cases. We’ve often found unusual traces of electromagnetic radiation upon examination of reported landing sites.’

‘Right. And assuming that such craft were made of some exceptionally pure composition of white metals – say, aluminium, magnesium, titanium or strontium – and that this unusually pure metal was electromagnetically charged, that would account for the fact that our UFO often appears to be white or silvery up close, a dull or dark gray when viewed through atmospheric haze, or is just as often surrounded by a glowing halo of various colors.’

‘Precisely. And, of course, as you’ve just said, should it be able to create a color source beyond the known spectrum – and turn that source on and off at will – it could be invisible to the human eye, show up on normal film, and yet materialize in our visible spectrum whenever it wishes.’

Stanford whistled softly. ‘That would explain a lot,’ he said.

‘The whole subject is a mystery,’ Epstein said. ‘And it’s driving me crazy.’

The thunder roared outside and was followed by crackling lightning. The doors rattled, making Epstein glance up, then he stared down at the floor. His own words were meaningless to him; they were words to bridge the silence. He was frightened and he didn’t know why, which only made him even more frightened. Stanford clearly felt the same. He appeared to be deep in thought. They were both very frightened at this moment, neither knowing the reason. Epstein thought of Professor Gerhardt, thought of what Stanford had said: Professor Gerhardt had changed in a subtle manner, and was hiding some secret knowledge. Epstein sighed and sipped his Scotch, heard the beating of the rain. He thought of the night at Galveston, of the strange girl on the porch, of her ambiguous smile and distant gaze, her eyes fixed on the sky. He wondered what the girl had experienced, wondered how it had affected her;

wondered if Gerhardt had been affected the same way, and, if so, to what extent. Epstein looked again at Stanford. His younger friend was pale-faced. He had never seen Stanford so tense before, and he cursed the whole mystery.

‘We should go to sleep,’ he said.

‘I can’t sleep,’ Stanford said.

‘What on earth do you think is going to happen?’

‘I don’t know,’ Stanford said.

Epstein stared at the shuttered doors. They were rattling dementedly. Thunder roared and lightning flashed through the shutters and the doors shook again. Epstein felt that he was dreaming. The storm seemed to be unnatural. He saw Stanford rising slowly to his feet and then putting his glass down. Epstein couldn’t think straight. He saw Stanford turning around. The lights suddenly went out, plunging the room into darkness, then the locks on the shuttered doors snapped and the doors were blown open.

The howling wind rushed in, , sweeping Epstein from his chair, filling the air with flying sheets and pillows and papers and bottles. Epstein rolled across the floor, heard the sound of exploding glass. A fierce light filled the room, very warm, almost blinding, and he gasped and rolled into Stanford and they both slammed into the nearest wall. Stanford cursed and grabbed a leg of the bed. A bottle smashed above his head. The wind howled and pressed Epstein to the wall with debris flying around him. The heat. The white light. He covered his eyes with his hands. The heat receded and he opened his eyes to see a black, streaming darkness.

‘*Gerhardt*!’ Epstein bawled.

He crawled toward the main door. A spinning sheet coiled around him. He cursed and clawed wildly at the sheet while the wind hammered at him. Then it hissed and receded. He looked up, disbelieving. The wind still swept the

rain across the porch, but the storm seemed more natural. Lightning flashed across the sky, briefly illuminating the room; he saw Stanford rolling away from the bed and clambering back to his feet. ‘Jesus Christ!’ Stanford said. He glanced dazedly around him. Epstein clambered to his feet and shook his head and then rushed to the main door.

‘*It’s Gerhardt*!’ he bawled.

Epstein pulled the main door open and found the corridor in darkness. He and Stanford both raced along the corridor until they reached Gerhardt’s room. The room door was open. There was no one inside. Epstein cursed and looked frantically at Stanford and then they both started running.

The whole hotel was in darkness, doors opening and closing, people shouting as they hurried back and forth, a few carrying torches. Stanford and Epstein rushed outside. The wind howled along the terraces. The coco palms were bent low and creaking, silhouetted in faint light.

‘*The beach*!’ Stanford bawled.

They ran together along the terrace, passed Reception, crossed the patio, the wind howling and sweeping the rain about them, almost bowling them sideways. Stanford reached out for Epstein. They held on to each other. They fought their way through the rain and beating wind until they came to the gardens. Stanford pointed a finger. ‘ – *down there*! *Somewhere there*!’ He started forward, pulling Epstein with him, thunder rumbling above them.

The storm was demoniac, lightning ripped through the sky. They leaned forward and headed into the wind, circling around the hotel. Torches shone and blinked out. The gleaming white walls receded. They found the track at the rear of the hotel and headed for the beach. Epstein kept his head down. The thunder made his ears ring. He glanced up as more lightning ripped through the sky, a giant skeleton hand. Stanford was shouting at him. Epstein couldn’t hear what he said. The wind howled beneath the rumbling of the

thunder as the rain poured down brutally.

‘ – *there he is*! *Over there*!’

Lightning flashed across the sky, illuminating the ground below. Epstein looked ahead and saw Professor Gerhardt, a shifting ghost in the distance. Gerhardt was wearing his pyjamas. He was not looking back. He was hurrying toward a grove of coco palms that led down to the beach, his pyjamas flapping wildly about him, both hands on his head. More lightning flashed across the sky. A fierce glare flared up and died. The winding track and the surrounding earth and trees materialized and then vanished.

‘ – *what the hell is he after*?’

Stanford shouted against the wind, the rain hissing and sweeping across him. The lightning lit up the night and the distant palm trees. Professor Gerhardt had vanished. Stanford cursed and raced ahead. The lightning passed and he saw a strange glow fanning out in the sky.

‘ – *over there*! *That’s the path*!’

Stanford pulled Epstein onward. They stumbled toward the palm trees. Thunder roared and lightning tore the sky in jagged fingers of yellow flame. Then the darkness returned. They saw that glow above the sea. Stanford cursed again and Epstein groaned. The wind whiplashed the rain. The thunder roared and the wind howled through the trees and the mud made a squelching sound. It all seemed like a nightmare. The land flared up and vanished. They were blinded by lightning and lost in darkness, and they stumbled through the beating wind and rain as if running in circles.

Then they reached the palm trees, which were quivering, pouring rain. The lightning flashes and they saw a stretch of sea, a black sheet streaked with silver. Then it was dark again. Thundered rumbled above their heads. Stanford pointed to the left and started forward and pulled Epstein with him.

They passed between the creaking trees. The branches shivered and drenched them. They left the shelter of the trees and found the path that ran down to the beach. More lightning illuminated the beach before returning to darkness. They had not seen the beach. To their right, between them and the beach, was a high bank of earth.

‘ – *we’re going down*! *Watch your step*!’

The steep track was running mud. They both slipped and tripped on stones. The track curved to the right, broadened out and then narrowed, climbed a little and then plunged on down and started leveling out again. The thunder rumbled above them, the wind howled and then receded, the rain lashed them in a final bout of rage and then abruptly ceased.

Epstein glanced up, surprised, saw a dark cloud drifting by, saw the stars and then gazed down sloping earth and saw a white stretch of beach. Epstein couldn’t believe it. There was no wind there at all. Stanford jerked his wrist and pulled him forward and they both hurried downhill.

‘*There he is*!’ Stanford hissed.

They both stopped on the instant, saw a broader expanse of beach, Professor Gerhardt hurrying across the sand, his pyjamas still flapping. The moonlight fell upon him, elongating his shadow; he was drenched and his hands were by his sides and he seemed very fragile. Then he stopped walking. He was near the coco palms. Another man came into view, uncommonly small and slim, wearing a one-piece suit of silvery material, a strange cap on his head.

Stanford and Epstein were both stunned. They stared in silence, staring down. The banked earth limited their vision to a triangular stretch of beach, the long lines of trees forming one side, the other formed by the moonlit sea. Professor Gerhardt was near the trees. The small man had stopped in front of him. Epstein blinked and felt a pressure in his head, an almost imperceptible vibrating. The small man stepped up to Gerhardt, his suit gleaming in the

moonlit. He reached out with his left hand, touched Gerhardt on the neck, then they both walked to the right and disappeared behind the high, muddy bank.

‘Jesus Christ,’ Stanford said, ‘did you see that? *Gerhardt didn’t resist*!’

They both started running again, slipping and sliding down the track, the mud squelching beneath their bare feet, the branches shivering and dripping rain. Epstein felt cold and frightened, his head tight and vibrating. He thought he heard a bass humming sound, but he couldn’t be sure. They stumbled together down the track, passed through moonlight and shadow, gasping as the branches dripped rain, further soaking their clothes. Stanford cursed and then fell, tumbling down the last stretch of the hill. He rolled over and then clambered to his feet and they both raced to the beach.

‘Oh, my God!’ Epstein whispered.

They both slithered to a halt. The beach lay before them. It was fringed with coco palms and those trees formed a wall that stretched in a semicircle toward the sea. Out there in the sea was an eighteenth-century ship. Its huge sails were billowing in the breeze, illuminated in white haze. The great disk was above the ship, was twice as long as the ship. It just sat there in the sky, about two hundred feet up, a dark mass in a plasma-like glow, the stars winking around it.

Stanford and Epstein just stood there. They were stunned by this awesome vision. They saw the past and the future in the present and were dazed by this miracle. The white sails of the ship billowed. The great disk glowed and pulsated. The air hummed and vibrated and seemed alive with some mysterious force. Epstein rubbed his stinging eyes. Stanford shook his head in wonder. The great disk hovered over the ship and they were both bathed in a silvery-white haze.

‘It’s the *Endeavour*,’ Stanford said.

‘What?’ Epstein said.

‘It’s a replica of Captain Cook’s ship.’

‘What the hell’s that *above* it?’

Stanford didn’t reply, but merely stood there, gazing up. The great disk was a dark mass in a glowing haze, its details obscured. The breeze ruffled Stanford’s hair. He glanced briefly at Epstein. They stared at one another, both speechless, wondering what they could do. The beach vibrated beneath their feet. They both heard the bass humming sound. The sound was all around them and above them and had no fixed direction. They both stared at the *Endeavour*. Its huge white sails billowed outward. Raising their eyes, they saw the great disk above, its glow hazing the stars.

Then Epstein remembered Gerhardt. He turned around to survey the beach. The sand stretched out to the curved wall of a cove at the end of the beach.

‘Gerhardt must have gone there,’ he said. ‘There’s nowhere else they could have gone. That creature must have taken him over there. I think we better go look.’

He started hurrying along the beach, followed instantly by Stanford. The light walling on the beach wasn’t moonlight: it came from the great, hovering disk. Epstein was gasping, but he kept moving, his heart pounding uncomfortably. The silvery-white haze fell across the nearby trees and made them look artificial. Epstein heard the lapping water, a rhythmic, timeless sound. He kept walking, feeling hollow and unreal, his head vibrating and tightening. He wondered what that was. He knew it came from the enormous disk. Stanford hurried up to his side and then passed him and raced on ahead. They were nearing the wall of the cove. Epstein felt a great fear. He saw a curved line of trees, a wall of stones, and then a roar split his eardrums.

The ground shook beneath him, sand swirling, sky tilting, and then he felt the

ground under his back and he rolled toward the trees. A fierce light swept across him. He covered his eyes with his hands. The sand was whipped up to rain down upon him as his ears started ringing. Epstein cursed and smacked his own forehead, blinked repeatedly and then looked up; he saw Stanford scrambling back to his feet, bathed in incandescent light. Epstein pushed himself back up, but fell weakly against a tree. The tree shivered and poured rain upon him as he forced himself onward. Stanford's eyes were too bright, looking stunned and confused. The air around him was red, blue and yellow, the colors flickering and merging.

They both looked out to sea and saw the stately *Endeavour*, bathed in moonlight and a spectral rainbow haze, the light flickering crazily. The great disk was still above it. The surrounding haze had disappeared. What they now saw was an immense, silvery disk rimmed with windows and flashing lights. The windows were long and narrow, curving strips of bright light, broken up by what seemed like black dots moving to and fro, inside. The colored lights were below the windows, running round the circular base, flashing from left to right, right to left, at incredible speed. The lights formed a kaleidoscope, flickering on and off brilliantly, turning the dark sea into blood and yellow lava and rippling green, changing the ship's sails into billowing rainbows, obliterating the starry sky.

Stanford gasped and turned away, shook his head and stared at Epstein. His friend looked like a translucent ghost, materializing and vanishing. Then they ran between the palm trees, scrambled over the wall of earth, slithered down to the cove on the other side and saw the flat, empty sand.

'We're too late,' Stanford said.

Epstein sighed and closed his eyes, his head vibrating painfully. The humming sound was all around him and above him and it seemed to dissolve him. He opened his eyes again. The shadows rippled with various colors. He moved forward and saw a large sunken circle, the sand curled at its edge. Looking up at the sky, he saw a globe of hazy light. It was flying obliquely

toward the great disk, moving slowly and gracefully.

‘Oh, God!’ Epstein whispered. ‘They’ve got him.’

Then the great disk disappeared. The night was plunged into starlight. The billowing sails of the *Endeavour* were gleaming white in the moonlight. Epstein didn’t remove his gaze. His tight head was still vibrating. He kept looking and he saw an enormous black patch where the stars should have been. Then he saw two squares of light, about three hundred feet apart. They were windows floating there in the sky, illuminated brightly from within. Then one of them blinked out and the glowing orb flew toward its partner. The glowing orb became a stark black silhouette in that square frame of brilliant light. Then the light blinked out, became a black hole in the sky, and the great disk reappeared, filled up the black hole, and the colored lights flickered on and off and then turned into a white haze.

The bass humming grew louder. The beach vibrated with some violence. The great disk became a dark mass within a pulsating glow, rising vertically toward the drifting clouds with serene, stately grace. The ship below it was untouched. Its sails billowed in the breeze. The white glow illuminated the blue sea and erased the stars nearest to it. The great disk continued ascending. The humming sound became fainter. The ground vibrated and then settled down and the silence was total. The great disk continued rising and shrinking until it was no more than a glowing ball. This ball reached the clouds and abruptly blinked out and the stars reappeared.

Stanford and Epstein were speechless. They stayed close to the lapping water. They stood there a long time, looking up, breathing deeply, bathed in the warm, silky moonlight, the stars glittering over them. The sea washed upon the sand, splashing lazily around their feet. They lowered their eyes and looked across at the *Endeavour*. There was no one on the boat. Its rigging shivered in the breeze. Its wooden hull was rolling from side to side, the boards creaking in protest. Stanford and Epstein stared at it. The white sails were bathed in moonlight. They looked up to see the stars in the sky, and then

they both walked away.

CHAPTER FIFTEEN

‘Okay, Stanford, I want you to understand one thing: I’m going to give you the information, I won’t ever do it again, and if you even breathe my name in your sleep, I’ll have your name in a doggie bag. It’s a very dangerous subject. I like to think it’s all behind me. So when we’re finished, when you walk out that door, make sure it’s the last time.’

O’Hara looked like a prosperous man, his tie straight, his cuff links gleaming, his face lined to match the graying of his hair, his blue eyes clear and hard. He was framed by a plate-glass window, his backdrop Manhattan, and his broad frame seemed oddly out of place in the neat, paneled office.

‘Okay,’ Stanford said, ‘that’s fine with me. First the Robertson Panel.’

‘According to my notes, the panel met from 14 January, 1953, to 17 January, in Washington, DC, and the meeting at the time was top secret. The seriousness with which the subject was to be treated may be best illustrated not only by the credentials of the men involved – all specialists in the physical sciences, with particularly emphasis on atomic research and advanced weaponry – but also by the fact that the group’s written verdict was to be given to the National Security Council and then – if the decision was that the UFOs were of extraterrestrial origin – to the President himself.’

‘That sounds like a heavy number,’ Stanford said.

‘It was,’ O’Hara said. ‘And what later intrigued me about the panel was that – at least according to the concrete evidence that I was seeing and hearing – the

extraterrestrial was in fact a grim reality and that the existence of the UFOs had been proven. Nevertheless, and pretty much to my amazement, the panel rejected the findings.'

'What findings?'

'I'll just give you a few. They'll be enough to convince you.' Like so many of the people that Stanford had been interviewing in the past few years, O'Hara, while puffing on a fat cigar, read from the file he had in front of him. 'For the first two days Ruppelt reviewed the Blue Book findings for the scientists, and what he said was pretty damned impressive. First, he pointed out that Project Blue Book received reports of only ten percent of the UFO sightings made in the United States, which meant that in five and a half years about forty-thousand sightings had been made. He then broke the sightings down into the percentage that was composed of balloons, aircraft, astronomical bodies, and other misinterpretations, such as birds, blowing paper, noctilucent clouds, temperature inversions, reflections, and so forth, pointing out that this still left four hundred and twenty-nine as definite unknowns. Of those unknowns, it was clear that the most often reported shape was elliptical, that the most often reported color was white or metallic, that the same number of UFOs was reported as being seen in daylight as at night, and that the direction of travel equally covered the sixteen cardinal points of the compass. Seventy percent of those unknowns had been seen visually from the air – in other words, by experienced pilots and navigators; twelve percent had been seen visually from the ground; ten percent had been picked up by airborne and ground radar, and eight percent were combination visual-radar sightings. Ruppelt then greatly disturbed us all by confirming that the UFOs were frequently reported from around places like our atomic energy installations, harbours and manufacturing areas. Finally, he asked us to take note of the fact that according to radar readings there were recorded flight speeds of up to fifty thousand miles an hour.'

'You were right,' Stanford said. 'It sounds impressive.'

‘Indeed,’ O’Hara said, puffing smoke. ‘And even more impressive was the fact that Ruppelt and Major Dewey Fournet had completed an analysis of the *motions* of the reported unknowns as a means of determining if they were intelligently controlled. Regarding this, Major Fournet, who had an exemplary reputation, told us of how – by eliminating every possibility of balloons, airplanes, astronomical bodies and so forth from the hundreds of reports studied, and by then analyzing the motions of the UFOs in the remaining unknown category – his study group had been forced to conclude that the UFOs were, in the words of the group report: “intelligently controlled by persons with brains equal to or far surpassing ours.” The next step in the study, the major explained, had been to find out where those beings came from; and since it seemed unlikely that their machines could have been built in secret, the answer was that the beings were from outer space. Surprised, Dr Stanford? Well, so were we… And we were even more surprised when, the following morning, we were shown four strips of movie film that had been assessed as falling into the definite unknown category.’

‘You mean the cinetheodolite movies taken by scientists at the White Sands Proving Ground in 1950.’

‘Bright boy. Those plus the Montana Movie taken on 15 August, 1950, by the manager of the Great Falls baseball team, and the Tremonton Movie, taken on 2 July, 1952, by Navy Chief Photographer, Warrant Officer Delbert C. Newhouse.’

‘And?’

‘The Montana Movie showed two large, bright flights flying across the blue sky in an echelon formation. The lights didn’t show any details, but they certainly appeared to be large, circular objects. The Tremonton Movie showed about a dozen shiny, disklike objects fading in and out repeatedly, performing some pretty extraordinary aerial maneuvers, and darting in and out and circling one another in a cloudless blue sky. Any possibility that the objects might have been astronomical phenomena was dispelled when the

film clearly showed them heading in the same tight cluster toward the western horizon, and, more specifically, when one of them left the main group and shot off to the east.'

'Anything more positive than that?'

'Yep. The Montana Movie had been subjected to thousands of hours of analysis in the Air Force lab at Wright Field, and their analysis proved conclusively that the objects weren't birds, balloons, airplanes, meteors or reflections – in short, they were genuine unknowns. As for the Tremonton Movie, it was studied for two solid months by the Navy lab in Anacostia, Maryland, and their conclusion was that the unidentifieds were not birds or airplanes, were probably traveling at several thousands of miles an hour, and were, judging by their extraordinary maneuvers, intelligently controlled vehicles.'

Stanford gave a low whistle and sat forward in his seat, thinking back on what had happened in St Thomas and of how it had affected him. It had left him in a state of wonder, overawed and disbelieving, but now, as he listened to O'Hara talking, he began to accept it.

'That was the evidence,' O'Hara said, 'and it seemed pretty damned conclusive, but the Robertson Panel still managed to reject it. The panel members duly spent two days going over the evidence, but the results of their ponderings were preordained. Guided by myself and my fellow CIA members, the panel simply concluded in their report that the evidence was not substantial, that the continued emphasis on the reporting of the phenomenon was resulting in, quote, "a threat to the orderly functioning of the protective organs of the body politic," and that the reports clogged military channels, could possibly precipitate mass hysteria, and might encourage defense personnel to misidentify or ignore actual enemy aircraft. In short: the real problem wasn't the UFOs – it was the *UFO reports*.'

Staring past O'Hara, Stanford saw the skyscrapers of Manhattan. Raising his

eyes, he surveyed the blue sky with its drifting white clouds. The sky revealed nothing. Sighing, Stanford lowered his gaze. His friend O'Hara, a private detective, once a CIA officer, was leaning forward with his elbows on his desk, exhaling smoke from his nostrils.

'So,' he said, 'we made some recommendations. First, we recommended that the two major private UFO organizations – the Aerial Phenomena Research Organization and the Civilian Saucer Intelligence – be watched because of what we described as their "potentially great influence on mass thinking" in the event of widespread sightings. Regarding this, we also inserted the sentence: "The apparent irresponsibility and the possible use of such groups for subversive purposes should be kept in mind." Next, we recommended that national security agencies take immediate steps to strip the UFO phenomenon of its importance and eliminate the aura of mystery it had acquired, the means being a public education program. Finally, we outlined a program of public education with two purposes: training and debunking. The former would help people identify known objects and thus reduce the mass of reports caused by misidentification; the latter would reduce public interest in UFOs and thereby decrease or eliminate UFO reports.'

'The liberal conscience,' Stanford said, 'would call that brainwashing.'

'The liberal conscience,' O'Hara said, 'would be right.' He grinned coolly at Stanford, leaned back in his chair, gazed momentarily at the ceiling, then, still puffing on his cigar, leaned over his open file once more. 'As a means of pursuing this educational – or, in the vernacular, brainwashing – program, the panel suggested that the government hire psychologists familiar with mass psychology, military training film companies, Walt Disney Productions, and TV personalities such as Arthur Godfrey to subtly convey this new thinking to the masses. They also – contrary to what we were later to tell Ruppelt – decided *not* to declassify the sighting reports, and implied – again, contrary to what we were to tell poor Ruppelt – that the Air Force should further *tighten* security and continue to deny nonmilitary personnel access to UFO files. In

other words: kill it.'

Thinking back on Gardner in Albuquerque, Stanford realized that Gardner, though a drunkard, had been telling the truth.

'Despite my own involvement in the Robertson Panel recommendations,' O'Hara continued, again studying the notes in his file, 'it was shortly after their release that I began wondering what the hell was going on. As you can see for yourself, the whole point of the Robertson Panel was to enable the Air Force to state for the next decade or so that an *impartial* scientific body had examined the UFO data and found no evidence of anything unusual in the skies. While this was an obvious distortion of the facts, it *did* mean that the Air Force could now avoid discussing the nature of the objects and instead concentrate on the public relations campaign to eliminate the UFO reports entirely. And given the nature of the panel's recommendations, there's little doubt that they were directly responsible for the policy of ridicule and denial that has inhibited an effective study of the phenomenon ever since; and that has, to put it mildly, some *unfortunate* effects on the lives of a lot of perfectly responsible civilians and Armed Forces personnel.'

'You mean, humiliation of UFO witnesses was fairly standard.'

'More or less,' O'Hara said. 'Anyway, given our brief about national security – we were still fighting the war in Korea, the Soviets had exploded their first hydrogen bomb, and the Cold War was still at its chilliest phase – I could understand the need for such a charade. However, what I *couldn't* figure out was why our superiors wanted us to lie to Ruppelt – wanted us to tell him that Project Blue Book was being expanded instead of run down, that UFO info was going to be freed of restrictions instead of being further restricted – and why they wanted him to believe that he could carry on with his plans when in fact we intended stopping him in his tracks.'

'Did you ever find out?'

‘I’m not sure, but let me tell you what happened… As you’ve already indicated, you know what happened to Project Blue Book: it was practically wiped out. Also, by that time, the recommendations of the Robertson Panel were in full swing – and the most credible UFO witnesses, namely aircrews and radar operatives, had been successfully frightened out of submitting their UFO reports. But worse was to come… In August 1953 – the same month Ruppelt left the Air Force – the Pentagon issued Air Force Regulation 200-2. AFR 200-2 was drafted purely as a public relations weapon in that it prohibited the release of *any* information about a sighting to the public or media, except when the sighting was *positively* identified as natural phenomena. In addition, while the previous regulation had stated that sightings should not be classified higher than restricted, the new regulation insured that *all* sightings would be classified as restricted. Then, even worse, in December 1953 the Joint Chiefs of Staff followed AFR 200-2 with Joint Army-Navy-Air Force Publication 146, and this made the releasing of any information to the public a crime under the Espionage Act, punishable by a one to ten year prison term or a fine of ten thousand dollars. And the most ominous aspect of JANAP 146 was that it applied to anyone who knew it existed – including commercial airline pilots. Needless to say, that regulation effectively put a stop to the flow of information to the public. To all intents and purposes – and contrary to public Air Force pronouncements – the UFO project had been plunged into secrecy.’

Stanford thought of Albuquerque, of what Gardner had told him, of himself at the top of the stairs, dazed by incomprehension. That feeling was with him now, a growing fear that had no shape, and he began to understand that the facts were rarely what they appeared to be. He stared at O’Hara, his old CIA friend, wondering how such men managed to flourish without guilt or shame.

‘Wait a minute,’ Stanford said. ‘I’m getting a bit confused here. You say that the CIA virtually directed the Robertson Panel, but that their main concern was national security – not a belief in the UFOs.’

‘No,’ O’Hara said, now returning Stanford’s gaze. ‘I’m saying that our superiors hoodwinked us.’

‘I don’t understand.’

‘Listen,’ O’Hara said. ‘According to our superiors, the reason they wanted the interest in UFOs killed off was that the UFO *reports* were deemed a threat to national security: first, because a deliberately confused American public might think attacking enemy aircraft were merely UFOs; second, because a foreign power could exploit the UFO craze to make the public doubt official Air Force statements about UFOs and thereby undermine public confidence in the military; and, third, because in terms of psychological warfare, particularly in 1952, the communications lines of the whole country could be saturated by a few hundred phone calls, and such calls – which *always* came after a rush of UFO sightings – were putting the defense network in jeopardy. Those were the reasons they gave us for the need for suppression.’

‘But you thought they were bullshit,’ Stanford said.

‘Right,’ O’Hara said. ‘If national security was the issue, then the suppression had a certain amount of logic. However, if national security was the *only* concern, why were we humiliating so many UFO witnesses and harassing our own ground and air crews into keeping their mouths shut? The only logical explanation was that the higher echelons of the Air Force were more concerned about the phenomenon than they were willing to admit, that they possibly *knew* more about it than they were willing to admit, and that for reasons of their own they were actively encouraging their most competent personnel from investigating the subject.’

‘Ruppelt seems to be the perfect example of all this.’

‘Right,’ O’Hara said. ‘It seemed to me that the more proven unknowns Ruppelt came up with – and most of his unknowns *were* unknowns – the

more nervous the Air Force became. I first realized this when the CIA told us to lie to him about the recommendations of the Robertson Panel. I was even more convinced when they neglected to replace him when he went to Denver, and when they stripped Blue Book of its staff in his absence.'

'Still,' Stanford said, 'that doesn't necessarily mean too much. As you said, if they were genuinely worried about the sheer number of UFO reports clogging their communications network, they would have wanted those reports reduced to the minimum.'

'Let me give you a better example,' O'Hara said. 'Shortly after scaring the hell out of the Air Force with the evidence presented to the Robertson Panel, Ruppelt came up with a couple of cases that virtually confirmed that the UFOs were intelligently controlled.' He returned his gaze to the notes in his file. 'The first was a sighting that occurred over Haneda AFB, now Tokyo International Airport, in Japan. This UFO was initially observed by two control tower operatives who saw a large, brilliant light in the northeast over Tokyo Bay. The light, which was moving, was observed through seven by fifty binoculars; it had a constant brilliance, was circular in shape, and appeared to be the upper half of a large, round, dark shape that was about four times the diameter of the light itself. Then, when it moved, the tower operatives saw a second, dimmer light on the lower edge of the dark, shadowy portion. This particular UFO was simultaneously tracked by radar and observed by intelligence officers as it flew back and forth across the central part of Tokyo Bay, sometimes almost hovering, then abruptly accelerating to three hundred miles an hour. It was pursued by, and deliberately eluded, an F-94 airplane.'

'*Deliberately*?'

'So it seemed,' O'Hara said. 'That sighting was thoroughly investigated by the FEAF intelligence officers in the area, then later investigated just as thoroughly by Ruppelt. Both agreed that it was definitely not a weather target, that it definitely wasn't a star, that both visual and radar lock-ons had

proved that it was solid *and* moving. They also proved that each turn the UFO made was constant, and that the straight "legs" between the turns were about the same length. Indeed, Ruppelt later wrote that the sketch of the UFO's flight path reminded him very much of the crisscross patterns he used to fly during World War Two – and that the only time the UFO had seriously deviated from this pattern was when the F-94 tried to pursue it.'

'And the second sighting?'

'The second sighting was one that occurred on the night of 29 July, 1952, when an F-94 attempted to intercept a UFO over eastern Michigan. This sighting was even more interesting in that there was a definite reason for every move the UFO made. First, it made a one hundred and eighty-degree turn because the F-94 was closing in on it. Next, it alternately increased and decreased its speed – but only increase its speed when the airplane was closing in on it, and always slowed down when it was just out of range of the airplane's radar. Then, adding weight to his argument that such moves could not have been random, Ruppelt submitted a third report – the one he called the best unknown ever – of an F-84 pilot who chased a visually and radar located object right across Rapid City. According to the pilot *and* the radar operatives, that target accelerated and decelerated so that there was always *precisely* three miles between it and the F-84 – and it kept this up until the F-84 ran out of fuel. Later, both the pilot and the tower controller told Ruppelt that the UFO seemed to have some kind of automatic warning radar linked to its power supply.'

'Okay,' Stanford said. 'Let's assume the UFOs were intelligently controlled… But what has this to do with the CIA?'

'Think,' O'Hara said, studying his dwindling cigar, forming his lips into an O and blowing a thin steam of smoke. 'If, as the CIA claimed, national security was their only concern, such sightings should have scared the hell out of them and made them want to know more. That, however, was not remotely the case. Instead of encouraging Ruppelt or utilizing his information, they

went all out to stop him in his tracks – and they put him under surveillance.'

'So what you're saying is that they claimed to be concerned with national defense, yet they didn't want people watching the skies – a contradiction in terms.'

'That's right,' O'Hara said.

Stanford sighed and rubbed his eyes, feeling weary a slightly unnerved, convinced that he was getting out of his depth and approaching a danger zone. The contradictions were now obvious: national security did not explain them. It was clear that the Pentagon, the CIA and the Air Force were more concerned with the UFOs than they admitted and were still trying to hide that fact. He sighed again and studied O'Hara. His old friend's blue eyes were clear. Stanford shook his head wearily from side to side and wondered if he was dreaming.

'Keep going,' he said.

'Okay,' O'Hara said. 'I'll stick to Ruppelt for the moment. Because what Ruppelt did, and how the Air Force reacted, are representative of the whole shady story and might tell you a lot.' He stubbed his cigar out, put his hands behind his head, then leaned far back in his chair, now ignoring his notes. 'I had in fact been watching Ruppelt from about August the previous year, 1952 – and the order to report his movements simply intrigued me. Bear in mind that at that particular time there was a sudden rash of UFO sightings. Now, those sightings were mainly the build up to the beginning of September, when every morning for about two weeks there were half a dozen or so new reports from the southeastern United States, notably Georgia and Alabama, a lot of them from the vicinity of the new, top secret Atomic Energy Commission complex at Savannah River, many more over Brookley Air Force Base near Mobile, Alabama. That same month the NATO naval forces were holding maneuvers off the coast of Europe, namely, Operation Mainbrace. On 20 September an American newspaper reporter and a group of

pilots and flight deck crew on board an aircraft carrier in the North Sea observed a perfectly clear, silvery sphere moving across the sky just behind the fleet of ships. The object was large and appeared to be moving rapidly, and the reporter shot several pictures of it. The pictures were developed straight away and immediately studied by the intelligence officers aboard the carrier. The pictures were excellent, and the object looked like a large balloon – but no balloons were in the area and an analysis of all the photos proved conclusively that the object had been moving very fast. Then, the following day, six English Air Force pilots flying a formation of jet fighters over the North Sea saw a shiny, spherical object coming from the direction of the NATO fleet. They took after it and lost it, but when they neared their base one of the pilots noticed that the UFO was following them. He turned back toward it, but the UFO then turned away and outdistanced the RAF airplane in a matter of minutes. Finally, on the third day, a UFO was observed near the fleet, this time over the Topcliffe Aerodrome in England. A pilot in a British jet was sent in pursuit and managed to get close enough to describe the object as, quote, “round, silvery and white” and to note that it , quote, “seemed to rotate around its vertical axis and sort of wobble.” Then, when he tried to get closer, the UFO shot off…’

O’Hara sat forward again, removed his hands from behind his head, propped his elbows firmly on the desk and cupped his chin in his hands.

‘Naturally, those sightings disturbed NATO,’ he said. ‘In fact, according to an RAF intelligence officer in the Pentagon, it was the Mainbrace sightings that finally forced the RAF to recognize the UFO phenomenon – a fact they have denied to this day. However, Ruppelt investigated the case and assessed all those sightings as unknowns. Unfortunately, this encouraged him to believe that he could now pin down the UFOs for good… and it was this very enthusiasm that led to the destruction of the most important system ever devised for UFO research.’

‘Don’t look so pleased,’ Stanford said. ‘Just tell me what happened.’

‘Okay. For a long time Ruppelt and Brigadier General Garland, then chief at the ATIC, had been looking for a way of getting concrete information about the UFOs. What they finally came up with was a plan for visual spotting stations to be established all over northern New Mexico – an area that had consistently produced more UFO reports than any other area in America. The visual spotting stations would be equipped with specially designed sighting devices, all of which would be linked with an instantaneous interphone system: any two stations could then track the same object and, from their separate readings, compute the UFO’s altitude and speed. Also at each visual spotting station would be instruments to measure the passage of any body that was giving off heat, any disturbance in the Earth’s magnetic field, and any increase in nuclear radiation at the time of the sighting.’

‘I never heard of it,’ Stanford said, ‘but it sounds pretty impressive.’

‘It was,’ O’Hara said. ‘In fact, it was the first time that a proper, scientific system had been designed and submitted to the Air Force. It was virtually foolproof and if it had been adopted, we could have tracked, photographed and measured UFOs with unprecedented precision.’

‘And you’re going to tell me the Air Force killed it off.’

‘Right.’

‘Why?’

O’Hara shrugged. ‘I’m not sure. All I know is that in December of that year – when Ruppelt’s plans went to Washington, DC, for approval – the US Navy was going to shoot the first H-bomb during Project Ivy, and some folks in the Pentagon, remembering the unidentifieds over Operation Mainbrace, directed Ruppelt to fly out to the test area and organize a UFO reporting team.’ O’Hara grinned laconically, spread his hands out in the air, then gently kicked his chair back, his legs lazily outstretched. ‘As it is with the CIA, so it is with the Pentagon: there are wheels within wheels and somewhere there’s a

wheel you can't reach. What I mean by this is that the order for Ruppelt to fly to Project Ivy came down in November, but by December his plans for the visual radar sighting network were received in Washington… and shortly after that I received a phone call from the Pentagon, suggesting that I axe Ruppelt's trip – which, naturally, I did.'

'So what you're suggesting is that certain people in the Pentagon are genuinely concerned with the UFOs, but that others, for some unknown reason, don't want the UFOs to be investigated.'

'What a bright boy you are.'

Stanford stared past O'Hara's head and saw the tops of the skyscrapers, the sun a silvery ball in the clear sky, the white clouds drifting languidly.

'So,' he said eventually, '*were* UFOs seen over Project Ivy during the shooting of the H-bomb?'

'I don't know,' O'Hara said, 'and neither did Ruppelt. Shortly after Project Ivy came the Robertson Panel and its consequences, and a few months later, in August '53, Ruppelt, doubtless feeling bitter, left the Air Force for good. By the end of that year, Project Blue Book had a mere three staff members left, its investigating authority had been handed over to the 4602d – the inexperienced Air Intelligence Service Squadron – and most of its projects had been strangled systematically through a reduction in funds. Ruppelt, Fournet and Chops were no longer involved, and General Garland, once a strong Ruppelt supporter, never again raised his voice in defense of any UFO investigation.'

Stanford sat there saying nothing, not knowing what to say. He thought of Ruppelt and Gardner, of the deceptions and suppression, then he thought of Irving Jacobs in the desert and wondered what it all meant. The Air Force was covering up. The Pentagon was involved. The whole of Washington, DC, was concerned with the UFOs, but didn't want them investigated. Stanford

didn’t understand it. Nothing seemed to add up. The mystery deepened and swirled there before him like a black hole in space.

‘It just doesn’t make sense,’ he finally said. ‘What was the purpose of all that?’

‘I kept asking myself that question,’ O’Hara said. ‘The only thing I came up with was the thought that maybe there was something in the UFO phenomenon – and, more intriguing, that maybe the Air Force actually knew what the UFOs were and therefore wanted to keep the lid tight on the matter.’

‘That could make sense,’ Stanford said. ‘Why else would they set out to ridicule their own pilots and ground crews? Why else would they encourage officers like Ruppelt to investigate the matter and then, when they came up with firm evidence, harass them out of the scene?’

‘Right,’ O’Hara said. ‘And bear in mind how the defense forces operate. The Navy, the Army and the Air Force all run research projects independently of one another – and they usually keep their secrets to themselves. Likewise, in the Pentagon, there are departments so secret that even *the President* doesn’t know what they’re up to. The same could be said for the FBI and the CIA: behind the names there are numbers and those numbers can’t be checked; those numbers represent the nameless men who create their own laws.’

‘So,’ Stanford said, ‘there are always rumors.’

‘Oh, yes,’ O’Hara. ‘For instance, just before I left the CIA, there were rumors going around that there’d been actual UFO landings on Air Force bases, one at Cannon AFB, New Mexico, on 18 May, 1954, another at Deerwood Nike AFB on 9 September, 1957, and a third at Blaine AFB on 12 June, 1965. Now the automatic response to such stories is to assume that they couldn’t be true – that such events couldn’t possibly be kept secret, not only from the public, but from the vast majority of FBI, CIA and Pentagon staff.’

‘Not true,’ Stanford said. ‘Some of the most startling scientific discoveries have been kept under wraps with incredible efficiency for as long as fifty years. Antibiotics were discovered as far back as 1910, but weren’t truly applied until 1940. Likewise, nuclear energy was discovered in 1919, but not generally announced until 1965. In short, no matter how big the secret, we can make sure it stays that way.’

‘True,’ O’Hara said. ‘So… Could the fact that UFOs have landed on at least three different Air Force bases be kept a secret for almost a decade? I believe it could. I believe so because the Air Force, the Navy, the Army, the CIA or the higher echelons of the Pentagon could, if not *totally* suppressing such a fact, reduce that fact to a mishmash of vague speculation and rumor… And a very good example of this is the renowned Flying Flapjack.’

‘That,’ Stanford said, ‘sounds familiar.’

‘It should be,’ O’Hara said. ‘The most interesting thing about the Flying Flapjack is that no one in the CIA had ever mentioned it until 1950, yet it had been designed back in 1942. The Flapjack, originally known as the Navy Flounder, was a circular aircraft being built by the US Navy during the Second World War. At that time, what the Navy desperately needed was an airplane that would not require long airfields, could rise almost vertically from an aircraft carrier, and could be used in any cleared area just behind frontline troops. What they came up with was a combination of helicopter and jet plane, a saucer-shaped machine powered by two piston engines and driven by twin propellers. The prototype, designed by Charles H. Zimmerman of the National Advisory Committee for Aeronautics and constructed by Chance-Voight, reportedly had a maximum speed of four hundred to five hundred miles miles an hour, could rise almost vertically, and could practically hover at thirty-five miles an hour. Apparently, because the aircraft was wingless, the lessened stability presented problems, but a later model – the one since reported to be…’ O’Hara checked his notes… ‘The XF-5-U-1. That model solved the problem and was rumored to be circular in

shape, over a hundred feet in diameter, and with jet nozzles – which resembled the glowing windows observed on so many UFOs – arranged right around its outer rim. Further, it was built in three layers, with the central layer slightly larger than the other two. And since the saucer's velocity and maneuvering capabilities were controlled by the power and tilt of the separate jet nozzles, there were no ailerons, rudders or other protruding surfaces.'

'A genuine flying saucer,' Stanford said.

'Right,' O'Hara said. 'Now, as I've already stated, no one in the CIA – at least no one I dealt with – knew a damned thing about that machine until early 1950 when the Air Force, in a bid to legitimize their December 1949 termination of Project Grudge, released photos and vague technical info about the Navy Flounder and Flying Flapjack, adding in their press release that they had dropped the project back in 1942 when they had generously passed it over to the US Navy, which had more interest in it.'

'Christ,' Stanford said.

'Okay,' O'Hara said. 'Information about the Flounder and Flapjack was released to the public in April 1950 via the *US News and World Report*, and it touched off some interesting speculations. The first of these arose from the retrospective knowledge that the US Navy had always expressed more interest in a vertically rising aircraft than had the Air Force; that it had, up to 1950, spent *twice* as much money as the Air Force on secret guided missile research; that their highly secret missile-research bases were located around the White Sands Proving Ground – where the majority of the military UFO sightings had occurred – and that, because they were not involved officially in UFO investigations, they could conduct their own research in a secrecy unruffled by the attentions of the public or the media. The next interesting point was that the measurements taken by Navy Commander R. B. McLaughlin and his team of Navy scientist of the UFO they tracked over the White Sands Proving Ground in early 1950 corresponded closely, except for the speed, with the details of the legendary XF-5-U-1, that those details were

more or less known to the general public through McLaughlin's published article of that year, and that the US Navy, while refusing to make any comment about the Flying Flapjack project, promptly shipped Commander McLaughlin back to sea.'

'Christ,' Stanford repeated.

'Okay, Stanford, let's look at what we have here. First question: Were the rumors that passed around the CIA about flying saucers having landed on at least three Air Force bases based on fact? Second question: Could it be that the same machines that either landed on, or possibly were being *tested* on, those Air Force bases were the same objects that were frequently being observed over the White Sands Proving Ground area? In short, do we have here a scenario suggesting that the so-called unidentified flying objects are just what they appear to be – and that rather than being of extraterrestrial origin, they're actually the products of the US Navy's secret research activities since the Second World War?'

Stanford fought to control himself. He felt a cold, hard excitement. The facts tumbled like ball bearings in his head with confusing rapidity.

'Was anyone else involved in this?' he asked.

'All I know,' O'Hara said, 'is that in 1954 the Canadian government announced publicly – after having examined the Project Blue Book evidence on the Lubbock sightings of 1951 – that the UFO observed over Albuquerque was similar to a flying saucer they were then trying to construct but had since, due to lack of know-how and facilities, passed over to the US Air Force. The Air Force naturally claimed that they'd eventually dropped this project as being unworkable.'

Stanford leaned forward to place his face in his hands. He rubbed his eyes and then sat up again and stared straight at O'Hara.

‘This all sounds impossible,’ he said.

‘Impossible? Let’s review the facts, Stanford… We have the fact that the majority of the proven unknowns are observed either over desolate countryside or over top-secret military and civilian establishments. We have the fact that crude flying saucers were once constructed by the National Advisory Committee on Aeronautics, that they were one of the US Navy’s research projects from at least 1942 to 1947, that similar machines were rumored to have landed on military bases around the White Sands Proving Ground area, and, finally, that the Canadian government claimed to have worked on a flying saucer that was eventually passed on to the US Air Force. And last but no least, we have the fact that when a US Navy commander and his Navy scientists tracked and measured an unidentified flying object over the White Sands Proving Ground – and when that object turned out to correspond very closely to the Navy’s Flying Flapjack – that Navy commander was removed from White Sands and transferred back to sea.

‘Now let’s look at how the Air Force reacted to the most successful UFO investigations. We had, during that time, only three scientifically sound methods of analyzing the speed and dimensions of the UFOs, and, more important, of ascertaining whether or not they were intelligently controlled. The first was Major Fournet’s maneuver study of 1952, the second was the Project Blue Book compilation of official unknowns, and the third was Captain Ruppelt’s planned visual-radar sighting network. Regarding these, the Air Force denied that Fournet’s maneuver study ever existed, secreted Project Blue Book’s findings behind the Espionage Act, and killed off Ruppelt’s visual-radar sighting plan.

‘What else did we have? We had an Air Force that insisted that UFOs did not exist, yet made the release of information on that subject to the public a crime under the same Espionage Act. We also had, in that regulation, a threat not only to military personnel, but to civilian airline pilots and any civilian who happened to know that the regulation existed. We had, more mysteriously, an

Air Force which claimed that national security was its only concern, yet ensured that its own air crews and ground crews would *not* report unidentified objects in the sky… What do *you* think it means?'

He stared directly at Stanford, his eyes blue and unblinking, as Stanford sat up straight in his chair, feeling slightly unreal.

'That still begs the question,' Stanford said. 'Is all this *possible*?'

'And the answer must be "yes",' O'Hara said. '*All* things are possible. As you yourself said: in this context we only have to think of the extraordinary innovations in today's science and technology, then remember that such miracles are only the tip of the iceberg, and that what goes on behind the guarded fences of our top-secret establishments is probably decades ahead of what we officially know about. Given this, the speed and capability of the unidentified flying objects are not beyond the bounds of possibility. Also, given this, it is not beyond reason that the UFOs rumored to have landed on various Air Force bases are the products of a military program so secret that only the personnel on those bases know what's going on.'

O'Hara checked his wristwatch, then pressed a button on his desk phone. The door of the office opened and a secretary entered, moving over to stand beside Stanford, very sleek and efficient. Stanford stood up, feeling dazed. He also felt a growing rage. He glanced at the girl, at the paneled walls of the room, at the clear sky beyond O'Hara's head, at O'Hara's broad outline. The facts were amazing. The possibilities were frightening. Stanford looked at O'Hara's sky-blue eyes and let the rage become part of him.

'There the case rests,' O'Hara said. 'Don't come back, Dr Stanford.'

CHAPTER SIXTEEN

The New Order was planned and executed with the sort of ferocious drive that only the mystically inclined can possess. Albert Speer was the architect: he created the environment for their vision. In the works of Albert Speer and the other Nazi architects I could see the realization of Lebensraum in its most concrete form. Lebensraum – space – German conquest and expansionism: the great buildings and the underground factories were signposts to my future.

Himmler showed me Hitler's teahouse. It was on top of the Kehlestein Mountain. The five-mile road that ran up from the Berghof had been hacked out of the side of the mountain by the sweat of slave labor. In the peak of the mountain was an underground passage; at the end of the passage was a copper-lined elevator, its shaft about four hundred feet deep, hacked out of the solid rock. That elevator descended to an immense, high-walled gallery, supported by baroque Roman pillars. At the end of the gallery, also hacked out of the mountain, was a dazzling, glassed-in, circular hall. And standing in that great hall, looking out through the windows, I saw nothing but the other mountains and sky – an overwhelming experience.

The impossible made possible – such was constantly accomplished. If the dreams were grandiose, the actual achievements were more so: the achievements of men who could make the impossible seem commonplace.

The German genius was for organization. In that area it had no peer. Add to this the fact that their well of slave labor was bottomless, and what one had was the dream as a reality. Who built the mighty pyramids? The thousands of

Egyptian slaves. The Third Reich had the genius and seven and a half million slaves, and given the combination of these two, all things became possible.

Seven and a half million slaves. Slaves who worked an endless day. Slaves who hacked out the mountains and dug tunnels through the earth and moved rocks and equipment and stores, and never complained. Such were my resources. I could have made Egypt envious. And given that, plus my own grandiose ambitions, there was little I couldn't do.

I was very close to Himmler. He unveiled his great dream. It was a dream of Atlantis reborn from the ashes of war. No Jews or subhumans. A blond SS would rule. In a society of masters and slaves there would be no dissension. Magnificent cities of steel and glass. The pure Aryan predominant. Himmler told me of his dream of a wilderness populated by supermen.

'How do you build Atlantis? You need masters and slaves. The masters will be the elite of my Death's Head SS; the slaves will be the Poles and the Czechs and all the other low races. And how do we do it? It is easy, mein freund. We keep building the camps, we ship the Jews there by their thousands, and when the wires of the camps begin to bulge we build more crematoria. Gas the schweine and burn them; let them turn to smoke and ash. When the camps have been cleared of the Jews we bring in the subhumans. The subhumans are the workers. They exist as mere slaves. They live just to work and that work is for the glory of the Reich – the slaves will build the new temples.'

The new temples would be the factories, the universities and laboratories; the new religion would be knowledge and conquest, the return of the Superman. How grandiose the dream! How impressive the rehearsal! Himmler wanted cities under the earth and he set out to create them. He drove me all around Germany. He showed me what could be achieved. I saw the great underground factories and I learned what was possible.

I remember Nordhausen. It had been hacked out of the Kohnstein Mountain.

Thirteen thousand slaves from Buchenwald had done it with muscle and sweat. It was empty when I first saw it. The V-2 complex was still to come. It had tunnels eighteen hundred meters long, and nearly fifty side chambers. I gazed about me in wonder. Himmler scratched his nose and smiled. The work area was one hundred and twenty-five thousand meters square, buried deep in the mountain. Himmler showed me around. His voice echoed in the silence. There were twelve ventilation shafts, huge generators supplied the light, and special heating ensured a constant temperature, day in and day out.

'Here thousands will work. The slaves will live in a separate camp. That camp, which now exists, is hidden deep in a mountain valley, less than a kilometer from the entrance to one of the tunnels. It has every facility. Lots of barracks, a brothel. It has a sports ground and a hospital, a kitchen and a laundry, a psychological and vocational selection unit, a crematorium and prison. There is also the town of Bleicherode. It's twenty kilometers from here. There, the new tunnels, sixteen kilometers deep, will house several more missile factories and living quarters for thousands. What else are mountains for? How else do we use the slaves? The new temples will be underground cities that are virtually impregnable.'

I still remember his every word. His voice echoed in that vast silence. I knew that the whole area, from the Harz Mountains to Thuringia, south of Prague and across to Mahren, was littered with similar tunnels and underground factories. Only a few were known to Hitler. Himmler controlled them all. They were cloaked in the strictest secrecy and ruled by the SS. The work went on night and day. All slackers were shot or hung. The underground factories were totally insular colonies, worked by masters and slaves, unrestricted by moral laws, and yet very few Germans knew about them or would ever set eyes on them.

Thus were my problems solved. I saw what could be achieved. Standing there beside Himmler, in that enormous, silent cave, I thought of all the thousands

who would work there, and knew where my future lay. Himmler dreamed of ice and fire. He dreamed of cities beneath the earth. He saw the sun flashing off the frozen peaks that showed only emptiness. I would take what Himmler offered. I would hide in glass and stone. I turned around and stared at Himmler's modest eyes and saw his madness as sanity.

'The New Order needs its masters and they have to be Aryan: blonde-haired and blue-eyed and strong – and absolutely obedient. Such are found in the Jungvolk – the boys of ten to fourteen – and they are formed in the Hitler Youth, given the Blood and Honor dagger, retrained to worship the Führer and the Nation, and then join my SS. Once there, they are mine. I do with them what I will. They no longer belong to Hitler, but to me – and they worship me slavishly.'

Himmler dreamed it and did it: he gave birth to his acolytes. The mild chicken farmer blinked his modest eyes and saw a world of godmen. The SS was Himmler's church, his bed and his altar; it was an Order run on Jesuit principles and disciplined with an iron fist. All its members were racially pure. They were bound together by sacred oaths. They were stripped of their history, given numbers instead of names, indoctrinated with the myths of the Volk and emerged as disciples. No questions would be asked. No order would be ignored. Their blind obedience would let them wade through hell without shame or revulsion.

I believed in this approach. Without discipline there is dissension. Himmler's ultimate aims struck me as religious, but his methods were sound. We cannot progress with freedom. Free men are a curse. Such men resist change because it leaves them exposed as superfluous. Himmler understood that much. He feared individuals. He felt that individuals were a threat to his grand masterplan. And what was his plan? He wanted gods, not normal men. He believed in obedience, in controlled breeding and vivisection; believed in biological mutation and its product, the Superman. Such a dream is not uncommon. Modern science still pursues it. Out there, in the world beyond

the ice, primitive surgeons hack bone for it. As for myself, I accepted it: men were meat to be used. I believed in biological mutation and used all that was offered.

'The New Order will be purified. The subhumans will be slaves. All dissenters will be stripped of their resistance until they, too, obey. Failing that, they will be removed by gas, gun or noose – and even then, we will ensure that they contribute to the good of the Order. Gouge the gold from their teeth. Use their skin for lampshades. We will turn their bones to ashes and dust in the great crematoria. It is necessary to do so. We must affirm that we are serious. We must let them know that discipline is all, and that their ash can be useful. The New Order will be strict. Its one goal will be progress. It will be dedicated to experiment and research, to the advancement of knowledge. Most laboratories have limitations; this won't be so in the New Order. The subhumans, who are useful as slaves, will also serve us as specimens.'

Not all aeronautics. That went on at Kummersdorft West. In the hangars of Kummersdorft West my other dream took wing. I worked with Schriever and Belluzzo. Perhaps Miethe and Habermohl. I remember the names, not the faces, and I feel no affection. Nonetheless, I worked with them. My restless genius drove me. The vicissitudes of the war did not touch me as my project expanded. How many nights did I go sleepless? I think back on that with pride. I was in my early sixties at the time, but I drove them relentlessly. The first disk took shape slowly. There were many set-backs. I traveled north and south, east and west, stealing men and ideas. Factories hidden in the Schwarzwald. The R-Laboratory in Volkenrode. Heated discussions about electrostatic fields and gyroscopic controls. The emerging disk filled the hangar. Schriever's eyes were filled with greed. The four legs that housed the gas turbine rotors reflected the bright lights. Schriever studied the disk with wonder. This recollection makes me smile. What Schriever gazed upon with such greed and admiration was a primitive toy. The real achievements were in my files. What Schriever saw was nothing. In the hangar in Kummersdorft

West I was building a useless thing.

The deceit was necessary. That was no one I could trust. The Third Reich was filled with frightened, ambitious men who yearned to make an impression. I did not trust Rudolph Schriever. I saw the death in Himmler's eyes. I remembered my past, the busy hangars in Iowa, all the businessmen and cowardly politicians who had smothered my life's work. The same thing could happen again. The war would not last forever. Already, in 1941, I saw the Reich's trickling wounds. Just how long would Himmler last? And how long could he keep his secret? I wanted to utilize his masterplan, but what guarantees had I? The Nazis devoured their own kind. They might well devour Himmler. Either that, or the Reichführer would turn on me, destroying all I had gained. Heinrich Himmler: the Reichführer. His mild eyes did not deceive me. His neat fingernails were polished with blood and his smile hid hysteria. No, I didn't trust him. There was no one I could trust. And so I gave him just a little, a prototype that would not work. I kept explaining that I needed more time and that the problems were numerous.

A delicate maneuver. A great cunning was required. The disk had to fool the other engineers while still lacking in something. I used obsolete technologies. I gave the engineers their head. Gas turbines and liquid-fuel rockets were the fruits of their labors. Such toys kept them happy. Schriever's eyes shone with triumph. Young and lean, he showed his drawings to Himmler while I went my own way. Their flying disk had been surpassed. The real achievement was in my files. I gave a little and took a great deal and listened always to Himmler.

'We have our underground factories. We have our chosen location. We have our masters, the SS, and our slaves and your own crystal genius. But that isn't enough. We need more than normal men. What we need is a biological mutation that will lead to true greatness. We must learn to control the workers. Not with whips and not with guns. What we need is automatic control of their bodies and minds. The human brain must be examined. The

body's secrets must be explored. We must try to steal their will and their strength and leave them just what they need. The democracies cannot do this. Regressive morals would forbid it. But here, at the dawn of the new era, there is nothing to hinder us. We must use the Ahnenerbe. We must use the Lebensborn. We must study racial characteristics and breed only the purest. This will solve the first problem. In this way we will find the Superman. Nevertheless, that leaves the problem of the workers, and we must solve that also. Control of mind and body. We must find a whole new method. I think of medical and psychological experiments of the most extreme kind. The camps are yours to command. The schweine there are useless meat. The New Order needs a wealth of mindless muscle and your genius must find it.'

The concentration camps were the laboratories. The prisoners were the guinea pigs. The whole mystery of human life was explored as it writhed on the tables… What are the limits of human pain? How long before the lungs collapse? Will scorched flesh, if left unattended, renew itself or turn gangrenous? Inject this woman with jaundice. Inject that child with typhoid. Shoot this creature with poison bullets, graft a bone, transfer a limb, remove testicles and ovaries and intestines, but don't use anesthetics. Was it the surgery that led to death? Was it death through shock or pain? Put that frozen man between those two whores and then check his responses. More work. (It rarely stopped.) The Ahnenerbe needs human heads. The Institute for Research into Heredity needs anthropological measurements. Take these filthy Jews and Poles. Strip them naked and measure them. If suitable, put them into the gas chambers and then chop off their heads. Ship the heads off in canisters. Use extreme care when packing. Peel the skin from the bones of the corpse, dissolve the bones, use the healthy flesh. This strip decomposed already. A good piece of material there. These tattoos would make a nice lampshade in Frau Koch's bedroom… But such was Nazi frivolity. My true research never stopped. The concentration camps, with their abatoirs and crematoria, were extraordinary laboratories.

'Do you understand at last? The New Order is very real. It will be broken

into colonies, each separate, each with its work, all divided into masters and slaves, existing just for the future. What's a colony in our wilderness? It's just another Nordhausen. You ship the subhumans in to build your underground complex, you control them with your dogs and the Death's Head SS, and then you move in your scientists and technicians and administrators, and you bind them all together with fear of the all-seeing masters. And once there, where can they go? There is no way in or out. They will live underground, seduced by power, cowed by fear, the masters bound by their oaths, by their religious convictions, the subhumans by torture and death and the lack of all exits. Yes, American, it is possible. We are halfway there already. You must work, you must complete your great disk, before we settle the matter.'

So I listened to Himmler. So his droning words encouraged me. Not for long did I think he would survive, but his ideas were valuable. I used him and his facilities. We filled the trains with nameless thousands. The slaves were shipped to the harbor of Keil and then they just disappeared.

Yet I had to be careful. I could not hold back too much. Himmler pressed me for a test flight of the disk, and I had to oblige. It was 1941. I believe it was June. The steel doors of the hangars were pulled open and the sunlight poured in. This much I remember. The disk reflected the sunlight. Schriever climbed into the dome-shaped pilot's cabin, his eyes afire with excitement. The engineers retreated. They all shielded their eyes. Himmler joined me behind the sandbags, his spectacles perched high on his nose. The disk looked like a metallic mushroom. It also resembled a giant spider. Its four legs housed the gas turbine rotors and ran down obliquely. Himmler rubbed at his nose. Sunlight flashed off his spectacles. There was a roar as the hollow legs spewed fire and filled the air with dense smoke. Yellow flames spat from the tarmac. The roar changed into a numbing sibilance as the disk left the ground. Himmler covered his ears. His body seemed to be shrinking. The disk shuddered and shrieked, lifted gently off the ground, hovered briefly and swayed from side to side and was obscured by the swirling smoke.

Himmler turned and stared at me. His mild eyes were like the sun. The disk roared and hovered just above the ground as Himmler reached for my hand.

CHAPTER SEVENTEEN

Richard licked his forefinger and ran it around the rim of his glass. The cigaret smoke curled about him, stinging his bleary, bloodshot eyes, and the noise in the crowded, lunchtime pub was too much for his ears. He kept his gaze fixed on the glass, on the ice cubes in the Coke, but glanced occasionally, with a twisted, bitter smile, at Jenny's unfinished lager.

'Just one drink,' he said.

'No,' Jenny said.

'Just let me have half a pint of bitter. It won't affect me a bit.'

Jenny sighed and shook her head, her brown eyes devoid of humor, tugging distractedly at a lock of her curly hair and gently biting her lower lip.

'No,' she repeated. 'You're not supposed to drink anything. And once you start, you won't know how to stop – you never do anymore.'

'A half pint,' Richard said.

'No. Go to hell.'

'Just give me a sip of yours, for Christ's sake.'

'Drink your Coke and shut up.'

Richard rolled his eyes despairingly, picked his glass up and noticed that it

was shaking, held it to his lips with great care, had a sip, put it down again.

‘You’re still shaking,’ Jenny said.

‘What do you expect?’ Richard replied. ‘I haven’t had a drink for five days. I’m going out of my skull.’

‘You’re already out of your skull. You’ve been that way for a year now. I couldn’t take another year like that, so just keep your mouth shut.’

Richard didn’t reply to that. There was little he could say. He had drowned the past year in a sea of booze, trying to kill off the nightmares. Now he glanced around the pub, the cigaret smoke stinging his eyes, taking in the pinstripe suits, the black shoes and umbrellas, the pretty secretaries with their hair trailing loosely down their spines, their cheeks flushed with gin or Campari, their breasts thrusting invitingly. They all seemed remote to him, superfluous, unreal, their beauty and vigor redundant, diffused behind frosted glass. Then he looked at Jenny: brown eyes in a moon-shaped face. She was wearing her shabby parka and faded blue denims, her white blouse unbuttoned just above her breasts, her skin creamy and smooth. She seemed slightly more real, a bit closer, part of him, and the fact that she was still trying to help him filled him with shame.

‘A hypnotist!’ he exclaimed. ‘Jesus Christ! I can’t believe I let you persuade me.’

‘He isn’t a crackpot,’ Jenny said. ‘He’s a psychiatrist and neurologist, a Harley Street specialist, and since he can’t possibly make you feel worse than you are, you’ve nothing to lose.’

‘A psychiatrist?’

‘Don’t look mortified.’

‘You actually think I need a psychiatrist? You think I’ve gone crazy?’

‘So what would *you* call it?’

‘I’m not crazy,’ Richard said.

‘All right,’ Jenny said, ‘you’re not crazy… but you’re not healthy either.’

‘Ah,’ Richard said, touching his temple with a finger and turning the finger around like a screwdriver. ‘I’m sick in the head.’

‘Very funny.’

‘Yes, *very*.’

‘Listen, Richard, you’re not going to see a witch doctor. He won’t beat on his jungle drums.’ Jenny reached into her shoulder-bag, withdrew a packet of cigarets, used her lighter with a jittery, angry movement and threw it back in her bag. ‘What’s bugging you?’ she said. ‘The man’s just a fucking doctor. This is 1975, for God’s sake: it’s routine these days.’

Richard flushed and looked away and studied the glasses above the bar, hurt and embarrassed by her statement, but accepting the truth in it. The past year had been a horror, a gradual sinking into madness, the days viewed through the prism of booze, the nights strung out on nightmares. The police interview hadn’t helped, had in fact made it worse, their disbelief filling him with shame and deepening confusion. Now the wheel had turned full circle. He was himself loath to accept it. More and more he was resisting the idea that the incident had actually occurred.

‘Listen to me,’ Jenny said. ‘I don’t really think you’re crazy. I just happen to believe you’re mentally ill and you have to be cured. You used to drink like a normal person. I mean, you had the odd wild night. But you never *needed* to drink like you need to these days – and you need it too much. You just can’t go on like this. It won’t do you any good. You’ve already given up art school, you’re living off unemployment benefits, and you haven’t seen your family or friends in close to a year. What kind of life’s that? You’re only nineteen,

for God’s sake! You’ve been seeing your normal doctor for mysterious rashes and headaches, and you’re washing the pills down with red wine… You’ve got to sort yourself out, pal.’

Richard sipped his iced Coke, ran his fingers around the glass, looked up and shrugged his shoulders in defeat, his smile tight and pained.

‘I suppose you’re right,’ he said.

‘No bloody question about it.’

‘I haven’t seen too much of you either.’

‘Don’t blame that on me.’

Richard glanced around the pub and saw the beer glinting golden, the flushed faces of the men and women lined along the bar counter. Their conversation was noisy, a meaningless lunchtime repartee, and he felt a sudden sweeping isolation, as if no longer part of them. Had the incident occurred at all? Had he imagined the whole damned thing? The instant he considered this, he felt a fear that made his heart start pounding. Returning his gaze to Jenny, he saw her stubbing her cigaret out. She smiled when she glanced at him, her brown eyes as large as spoons, and again he felt that secret, gnawing shame that had now become part of him.

‘I’m getting better,’ he lied.

‘Don’t talk shit,’ Jenny said.

‘No, really,’ he insisted, ‘I’m getting better. I don’t think I need this.’

‘Richard, he’s only a *psychiatrist*.’

‘I don’t care. I feel stupid.’

‘Damn it, he often deals with *crazy* people… You’ll probably seem halfway

normal.’

‘It’s all bullshit,’ Richard said.

‘What’s bullshit?’

‘Hypnotism.’

‘You ever tried it?’

‘No. Of course not.’

‘Then what the hell do you know?’

Richard shrugged and glanced around him, seeing the upper-class brigade, the men with pinstripe suits and umbrellas, the women like fashion models. What was he doing here? He didn’t want to be here. He felt a slowly uncoiling desperation that threatened to choke him.

‘What good will it do me?’

‘You won’t know until you try.’

Jenny pushed her chair back and stood up with a determined movement, brushing her auburn hair from her forehead and avoiding his gaze. Richard sighed and raised his hands, an indecisive, weak gesture, but Jenny, ignoring him, turned away and walked out of the pub. Cursing quietly, he followed her out and found her standing on the pavement, exhaling cigaret smoke, her lips pouting attractively, her parka falling below her thighs, around the faded blue denims. She flounced off along the street, shaking her head in an angry gesture, turning the corner at Baker Street station as if no longer caring. Cursing softly again, Richard hurried after her, pushing his way through the crowds. He caught up with her as she passed the Planetarium and Madame Tussaud’s.

‘Okay!’ he said, spreading his hands in a gesture of surrender. ‘I apologize. *Okay*?’

‘Don’t bother,’ she responded. ‘I don’t want your fucking apology. I just want you to visit that psychiatrist. That’s all I ask.’

‘Okay, Jenny, you win.’

She stopped at York Gardens, the wind blowing her hair, her face pale and her lips a tight line, the brown eyes large and luminous. ‘Okay,’ she said. ‘Fine.’

They crossed Marylebone Road, passing a wall of stalled traffic, then walked silently along the opposite pavement, neither touching the other. Richard stayed a little behind, feeling nervous and confused, taking note of the gray streets, the stately rows of Georgian buildings, his throat dry and crying out for a drink, for the soothing oblivion. He needed that oblivion. He didn’t want to go back. What had happened was in the past and should remain there, buried deep and forgotten. He didn’t want to relive it, didn’t think he could stand it, and yet walking behind Jenny, following her into Harley Street, he knew that she was right, that he had to face up to the problem; that he had to tear the veil from the mystery that kept him in chains.

‘This is it,’ Jenny said.

She had stopped at a tall, flat-fronted Georgian house with a black door and polished brass handle. Richard stared at the door, at the names on the brass plate, and a tremor of dread rippled through him and congealed in his throat.

‘Oh, well,’ he said.

‘Are you going in?’ Jenny asked.

‘Yes,’ he said, ‘I guess I’m going in. Jesus Christ, I feel dumb.’

Jenny pressed the bell, her face closer to a speaker built into the wall, and a voice, distorted and indistinct, lazily drawled the word ‘Yes?’ Jenny gave Richard’s name, the tinny voice said, ‘Come up,’ then the door made an irritating buzzing sound that signified they could open it. Richard pushed the door open, letting Jenny pass through first, then he stepped in and closed the door behind him and the buzzing noise ceased.

‘The third floor,’ Jenny said.

They stood together in the hallway, its walls paneled in varnished wood, a thick dark-gray carpet on the floor, a potted plant near the front door. Richard stared at the elevator, at its polished metal door, and experienced a fleeting claustrophobia that made him shake slightly. He glanced uneasily at Jenny, at the high, ornate ceiling, at the stairs that curved behind the elevator and climbed past faded paintings. The fear crept steadily over him, devoured him, made him numb, and he felt himself dissolving where he stood, drifting free from his body. He didn’t want to go up there, didn’t want to relive the incident; he wanted to turn around and walk out, but it was too late for that.

‘We’ll use the stairs,’ Jenny said.

Richard just nodded, a dumb gesture of agreement, seeing her brown eyes through a film of panic, her head turning away from him. Then he followed her up the stairs, moving slowly, reluctantly, his eyes fixed on her blue-denimed legs, the high heels of her boots, the wrinkles where the parka curved out around her broad, swaying hips. It was coming back to him already, the white haze, the silhouettes, the woman with red hair and green eyes – the whole nightmarish catalogue. Richard started shaking, felt anxious and confused, his heart pounding dramatically, glancing down to see his booted feet on the carpet, sinking into deep pile. Then they reached the third floor, a gleaming elevator gate, a forbidding silence surrounding them. Jenny stopped at a door, raised her hand, let it dangle there for a moment, then she turned back and took a step toward him and gently embraced him.

It was a sad, instinctive gesture, an expression of love and doubt, a silent affirmation of her loyalty and commitment to him. Taken aback, Richard stood there, his hands at his sides, feeling the warmth of her body, her reality, and wondering what he could do with it. Then he slid his arms around her, felt her shoulder blades, her spine; he spread his fingers and pressed her closer to him and laid his cheek on her head.

‘It’s all right,’ he whispered.

She clung to him for another moment, her fingers scratching his back, her thighs and firm breasts molded to him before moving away. Then she glanced at him, her smile hesitant, eyes shadowed, and nodded and disappeared down the stairs, leaving scent in the air.

Richard stood there for some time, deeply moved, reawakened, closing his eyes and covering his face with his hands and taking deep, painful breaths. Then he put his head back, studied the ceilings ornate moldings, shrugged and knocked lightly on the door and heard a voice bid him enter.

He stepped inside, closed the door quietly behind him, saw walls of lime-green, a glass table, comfortable armchairs, a middle-aged woman behind the desk, looking up, smiling pleasantly.

‘Mr Watson?’

‘That’s right.’

‘You’re a punctual patient,’ the woman said. ‘Dr Campbell’s expecting you.’

She pressed a button on the desk, her hand milky-white and elegant, and announced Richard’s presence to Dr Campbell, speaking softly, precisely. Richard glanced around the office, not listening, not really present, still aware of Jenny’s warmth in his clothes, touched again with emotion. Then the woman stood up, a white blouse, a neat gray skirt, and opened the door to another office and motioned him in. Richard coughed into his fist, trying to

orientate himself, then he brushed past the woman, smiling at her, avoiding her gaze, and heard the door closing behind him with a sharp, clicking sound.

‘Ah! Mr Watson!’

‘Yes,’ Richard said.

‘Do you mind if I call you Richard?’

‘No.’

‘Good.’

Dr Campbell wore a gray-striped suit, a white shirt and a vividly colored yellow tie. His hands were spread out on his desk, cuff links glittering, what looked like a wedding ring on one finger. His hair was dark and fashionably long, tumbling carelessly on his forehead, lines of humor around bright blue eyes, his teeth possibly capped. He was in his late thirties, suntanned and clearly healthy, a handkerchief protruding from the pocket of his jacket, pressed and neatly folded.

‘Please,’ he said. ‘Sit down.’

Richard did as he was told, taking the chair in front of the desk, crossing his legs and then uncrossing them again and resting his hands in his lap. He glanced distractedly around the office, saw the same lime-green walls, some reproductions of Turner, a few framed diplomas, the doctor framed by a window.

‘Have you ever been to a psychiatrist before?’

‘No,’ Richard said.

‘Have you ever been *hypnotized* before?’

‘No,’ Richard said.

‘And does the thought of it bother you?’

‘Yes,’ Richard confessed.

‘Why?’

‘I don’t know. It just seems stupid. I don’t think it will work.’

‘You don’t believe you can be hypnotized?’

‘No,’ Richard said.

‘Why not?’

‘I just don’t believe it,’ Richard said. ‘I don’t think I’m the type.’

Dr Campbell smiled. ‘You just don’t believe it,’ he repeated. ‘You don’t think you’re the type. Is that why you think you can’t be hypnotized?’

‘Yes.’

‘Well, we’ll see.’

Campbell looked down at his desk, at a gray manila folder, opened the folder and pulled out some papers and thoughtfully studied them. Richard just sat there, feeling nervous and slightly vague, trying to seem a lot more casual than he was, wanting to get up and run.

‘An interesting case,’ Campbell said, glancing up from the papers. ‘You’ve clearly had a pretty bad year. How do you feel now?’

‘Okay,’ Richard said.

‘Are you nervous?’

‘Yes.’

‘Well, that’s normal. It means you’re still human.’ Campbell smiled at Richard, raised his hand and studied his ring, glanced down at the papers again and then looked back up. ‘It says here you’ve been drinking a lot.’

‘Yes,’ Richard said.

‘And you still have to drink?’

‘Yes.’

‘Why?’

‘I don’t know.’

‘And the nightmares?’

‘What about them?’

‘According to these notes, all your nightmares are exactly the same.’

‘So?’

‘So you’re not just dreaming… You’re repeatedly reliving the same incident.’

‘You mean, *you* think the incident was real?’

‘Not necessarily,’ Campbell said. ‘It *could* be a case of auto-suggestion, brought on by great stress.’

‘You think I’m crazy, is that it?’

‘Not remotely. I’m just saying that whatever happened during your period of amnesia could have led to this particularly vivid hallucination.’

‘Okay, I’ll accept that. That’s fine. Now how do you cure me?’

‘You really accept that statement?’

‘Yeah. Sure.’

‘Rubbish. Of course you don’t. You’re just saying that because you want to get out of here and go for a drink.’

Richard shrugged and spread his hands in surrender. ‘Okay, Doc, have it your way. Just tell me what you want me to say and I’ll gladly oblige.’

‘I just want you to say what you believe.’

‘I don’t believe anything. I *don’t know* what to believe. The whole business happened a year ago, and that’s a very long time. I told the cops about it. They laughed me out of their office. When I tried to tell anyone else, they just assumed I was crazy – and I think they were right. It couldn’t have happened. Things like that just don’t happen. So I really think you’re right – that I had some kind of blackout, and that during that time I hallucinated and then thought it was real. I don’t *care* what it was. I just want to forget it. I want to get rid of those nightmares and sleep soundly again.’

‘I didn’t say it was hallucination. I said it *might* be.’

‘I hallucinated. Believe me, that’s what happened. Now how will you cure me?’

‘You said you feel okay now.’

‘I was lying. I feel rotten.’

‘You mean physically?’

‘I mean mentally… I mean, I have trouble sleeping, I have the nightmares when I *do* sleep, and I keep breaking out in rashes and get very bad

headaches. And I think it's all part of the same thing.'

'Yes,' Campbell said. 'I have your medical records here. You never had such ailments before the alleged incident… and they *are* quite peculiar.'

'Peculiar? What do you mean by that?'

'They're not caused by anything physical. The rashes and the headaches are psychosomatic: brought on psychologically.'

'That's ridiculous,' Richard said.

'No, Richard, it's not ridiculous. People can *will* rashes and headaches… and fevers and ulcers and heartburn and stomach upsets and skin diseases… in fact, just about anything.'

'I'm not a hypochondriac.'

'I wasn't suggesting that at all.'

'That's what it sounded like to me.'

'No. Not hypochondria.' Campbell sat back in his chair, placed his hands behind his head, put his feet up on his desk and smiled pleasantly. 'Let me tell you about the human brain,' he said. 'The first thing to note is that the human brain, while undoubtedly being a remarkable instrument, is rarely used at even a *tenth* of its full potential. Now, most of our bodily functions are actually controlled by the brain – the brain tells us what to do, when to do it and how to do it – so what we see, hear, smell and feel are merely the colors, sounds, smells and sensations that the brain has *selected* as being most necessary. This selection isn't arbitrary – the brain selects what it assumes we need – but there are other sensations which, though being actual, are beyond the limited range of our immediate senses. However, by awakening certain dormant areas of the brain, either electrically, by the use of drugs, or through hypnotic suggestion, the scope of both our senses and our capabilities can be

dramatically expanded.'

'I can't see what this has to do with me.'

'Well, I'll tell you. Would you agree that drugs or electrical stimulation of the brain can change human behaviour?'

'Yes.'

'Fine. Now did you know that these methods of affecting the brain can also induce pain and similar experiences?'

'Yes. I've read about it.'

'Okay. Well, regarding hypnotherapy we can apply the same principles, the only difference being that the sensations are induced – or recalled – by a process of suggestion, rather than by physical means. In other words, just as through hypnotism a patient can be directed to go to sleep or awaken, feel a nonexistent pain or ignore applied pain, turn as rigid as a plank or relive long forgotten experiences, and generally do things that he would not normally contemplate – so, too, can the average human being actually *will* himself into pain, depression or serious illness, not believing for the slightest moment that he's doing it, convinced that it's physical.'

'I don't believe that,' Richard said.

'Don't you?' Campbell said. 'Do you know that a perfectly normal person, if told under a hypnotic trance that he has just been scalded, will actually come out in blisters? Do you know, further, that this same person, still in the hypnotic trance, can be burned or pierced with needles, experience no pain at all, and not be marked by the burning or piercing when snapped out of the trance state?'

'No, I don't believe that either.'

‘Believe me, Richard, if I hypnotized you and told you that you were a wooden plank, you would turn as staff as a plank, could be stretched out across two supports, and wouldn’t budge if a couple of people used your groin as a springboard… You would simply *become* a plank.’

‘Bullshit,’ Richard said.

‘No, lad, not bullshit. These are the realities of autosuggestion, tested and verified. So when I tell you that your ailments might be psychosomatic, self-induced, I’m not suggesting for a moment that you’re a hypochondriac… I’m merely saying that the ailments are a symptom of a deeper disturbance.’

Richard crossed his legs, uncrossed them, scratched his knee, then distractedly looked down at the floor and looked up again.

‘So,’ he said, ‘what are you going to do about it?’

‘I’m going to try to take you back to when you suffered the amnesia, find out what really happened during that lost three days, record what you tell me when you’re in the trance state, and then play the recording back to you.’

‘I don’t want to know,’ Richard said.

‘You have to know,’ Campbell said.

‘I don’t give a fuck,’ Richard said. ‘I don’t want to know.’

He was shocked by his own vehemence, sitting upright in the chair, flushing, his heart pounding dramatically, his throat abruptly constricting. Campbell looked thoughtfully at him, not showing surprise, then placed his feet back on the floor and propped his chin in his hands.

‘What frightens you?’ he asked.

‘I just don’t want to do it.’

‘Why not?’

‘I’m not dumb enough to be hypnotized. I don’t believe in it. It won’t work.’

Campbell smiled patiently. ‘Well, now,’ he said, ‘I think you’re antagonistic because you feel that being hypnotized is degrading. Let me therefore assure you, Richard, that any intelligent adult and most children over the age of seven can be hypnotized, that only the mentally retarded and the psychotic can *resist* being hypnotized, and that hypnotizability is in no way a sign of weak will. Indeed, the more intelligent and imaginative the individual, the better a subject he’ll be. You therefore needn’t feel ashamed. There’s nothing *wrong* in being hypnotized. Just think of it as another branch of medicine - and try to accept it.’

Richard crossed his legs, uncrossed them, scratched his knee, licked his lips, glanced distractedly around the office and then studied the floor. He thought of the past year, of the nightmares and the drinking, of the loss of his friends, of Jenny’s rage, of his own failing health. He couldn’t live like that much longer; it just didn’t make sense. He wanted to kill it off or be cured, but the fear held him back. He looked up at Dr Campbell, tried to speak but failed, so finally stood up and scratched his left ear and then shrugged in defeat.

‘What do I do?’ he asked.

Campbell smiled and stood up. ‘Excellent,’ he said. ‘I just want to try a few of your reactions and see if you’re suitable.’ He came around the desk to stand directly in front of Richard, gazed into his eyes, then stepped away and said, ‘Look at your wristwatch.’ Richard did as he was told. The time was four thirty. ‘Keep your hands by your sides,’ Campbell said, ‘and just relax, just hang loose.’ Richard did as he was told. He thought that Campbell was pretty foolish. Feeling sorry for Campbell, he decided to humor him to save him embarrassment. Campbell kept talking. He kept telling Richard to relax. He said, ‘Clasp your hands together,’ and Richard did so, wanting to humor him. Campbell kept on talking. He told Richard to relax more. He said, ‘Your

hands are clasped together and you won't be able to open them, no matter how hard you try.' Richard didn't bother trying. He wanted to humor Campbell. Campbell told him he could pull his hands apart, so Richard pulled them apart. Campbell told him to raise his right arm. Richard did as he was told. Campbell pinched his right arm and Richard didn't feel a thing because he didn't want Campbell to be embarrassed. Campbell told him to lie down. Richard lay down on the couch. Campbell told him to relax and Richard lay there and felt slightly amused. Campbell told him to close his eyes. Richard grinned and closed his eyes. Campbell told him to open his eyes again and look at his wristwatch. Richard opened his eyes. He raised his hand and studied his wristwatch. He blinked and then looked at his wristwatch once more. The time was four thirty. A whole hour had passed. Richard shook his head in disbelief and sat up on the couch, feeling vague but refreshed.

'How do you feel?' Campbell asked.

'Fine,' Richard said.

'How long do you think you've been asleep?'

'I haven't been sleeping.'

Richard looked again at his wristwatch . It was definitely four thirty. He shrugged and grinned foolishly, stood up and stretched himself, then went behind Campbell's desk and sat down and scribbled his name on a notepad.

'Why did you do that?' Campbell asked.

'I don't know,' Richard said. He stood up and walked back around the desk and stopped in front of Campbell. 'Did you tell me to do it?'

'Yes,' Campbell said. 'You've been asleep for an hour. You were obedient and you talked an awful lot and it's all down on tape.'

'Can I hear it?'

‘No.’

‘Why not? You said I could hear it.’

‘That’s before *I* heard it,’ Campbell said. ‘You’re not ready yet.’ He went to his desk, switched the tape recorder off, then sat down and scribbled something on the notepad and then looked up at Richard. ‘I want you to go home now,’ he said. ‘You should go to bed early. With a bit of luck, you won’t have any nightmares and you’ll get a good sleep. I want you to come back here next week. My secretary will give you an appointment. When you return, I’ll say something that will put you to sleep immediately, and the experience will be as painless as it was today. I’m taking you back gradually. I can’t do it too quickly. This means you’ll be coming back on a regular basis, for quite a few months. I don’t think this will bother you. In fact, you’ll probably want to come. At the end of the sessions, when all the pieces are together, you can hear what happened during those missing days. Okay? See you next week.’

Campbell pointed to the door and Richard left. The secretary gave him another appointment. He took the elevator down and stepped out into the street and headed straight for Baker Street station, melting into the jostling crowds. The journey home was uneventful. He changed trains at King’s Cross. The train was packed and the light stung his eyes and he felt very calm. He got out at Finsbury Park, feeling bright and exhilarated. There were drunkards in the long, tunneled exits that led up to the buses. Richard boarded the W7, bought his ticket and sat down, looked outside and saw darkness descending, the street lights flickering on. The bus took him to Crouch Hill. He stepped out and felt the cold. He walked along the dusty pavement, turned into a driveway, passed the parked cars and entered the apartment block, feeling strangely light-headed. He opened the front door and closed it quietly behind him, then he went along the corridor and stopped when he came to the bedroom. Jenny was stretched out on the bed, fully dressed, her eyes open. Richard approached the bed and stopped there, saying nothing, just smiling.

Jenny reached up for his hand. Their fingers locked and she pulled him down. Their tears mingled as they undressed one another and melted together. Richard poured himself into her. His remaining fear was drained away. He was surrounded by her arms, by the cradle of her thighs, and there, on that bed of flesh and bone, he slept the sleep of a child.

CHAPTER EIGHTEEN

James S. Campbell, BA, MA, MD

c/o Society of Medical Hypnotists

4, Victoria Terrace

Kingsway, Hove

Sussex, England

February 14, 1976

Dr Frederick Epstein

Aerial Phenomena Investigations Institute

Massachusetts Avenue

Washington, DC

USA

Dear Frederick,

Further to our telephone conversation of this morning, I am enclosing a transcript of the most recent taped hypnotic session with young Richard Watson. I am doing this with his permission.

I should remind you again that there have been a total of eighteen hypnotic sessions over a period of approximately six months, that the editing of the transcripts has been undertaken as a means of eliminating repetitions and verbal ambiguities, and that the complete tapes of all sessions can be heard in my Harley Street office upon your arrival in London. In the meantime, here is the background you requested.

Richard Watson first presented himself at my office on 9 September, 1975, at the recommendation of a professional colleague (the father of the young man's girlfriend) and with the approval of his personal physician. The patient had been suffering from persistent nightmares, insomnia and acute anxiety, all originating in a three-day period of amnesia which apparently began on the evening of 7 March, 1974, when the young man, and an unknown lady who was driving him at the time, experienced what he believed was a close encounter with extraterrestrials. The alleged incident took place on the A30 on Bodmin Moor in Cornwall.

According to the young man's original story to both his doctor and the Tottenham Court Road police (the medical records and a photocopy of the police interview are enclosed), the incident began when the car, being driven by its female owner, cut out and rolled to a standstill in a desolate area between Bodmin and Bolventor. Almost immediately, a strange aircraft described by the patient as 'enormous' descended vertically and released two three-feet diameter flying disks. These disks circled the car, appeared to be examining it by remote control, then shot 'beams of light' into it, allegedly stunning the woman, and then flew away to re-enter the 'mother' ship.

Shortly after this (mere minutes) two larger flying disks emerged from the mother ship and also circled the car. According to the patient, these disks were piloted by strange creatures, they also shone beams of light into the car, and those beams of light appeared to *pull* on the car and draw it toward the mother ship. At this point the mother ship descended, vertically, almost to ground level, appeared to split along the bottom, and then the car, by

mysterious means, was drawn up into it.

The period of amnesia appears to have begun at this moment, ending three days later when the patient awakened and found himself on a hill in *Dartmoor* – approximately thirty miles from the scene of the alleged incident. Neither the woman nor her car were to be seen.

According to the medical report, the patient could remember nothing of his 'missing' three days, but was suffering numerous nightmares, all of which were obviously related to the period immediately prior to the beginning of the amnesia. As a consequence of the amnesia, or of the alleged incident itself, the patient became alcoholic, suffered either insomnia or nightmares, developed severe headaches and skin inflammations (usually around the face and neck) and also succumbed to acute depression and anxiety.

Regarding this, it is to be noted that the young man's physician described him as being, prior to the incident, highly intelligent, emotionally stable, and imaginative.

The patient was, at the time of the incident, a student at the Hornsey College of Art in North London, where he was studying to be a graphic designer, but he dropped out shortly after the incident and is now living off what you Americans call 'Welfare.'

According to the police, young Richard reported the incident about a week after it allegedly occurred. According to Richard himself (a story repeated under hypnosis), he was held in the police station all night and then interviewed, the following morning, by two men in plain clothes who claimed they were from a government data department. Also, according to Richard's conscious and unconscious statements, the men who interviewed him told him that they had already located the female driver of the car, that she had denied the whole incident, and that she described Richard as being extremely drunk when she dropped him off near Bodmin. Richard was, in fact, drunk at the time, but insisted, even under hypnosis, that the incident had actually

occurred and that the woman had been a witness to it.

It was shortly after the interviews with the police and government officials that Richard, obviously depressed and less confident about the reality of his experience, began to develop the headaches and skin inflammations. As you can judge from the transcripts, the skin inflammations might well be psychosomatic manifestations of the ‘burn mark’ on his neck which he believes was caused by one of the so-called extraterrestrials.

For the following sixteen months Richard continued suffering the nightmares and attendant insomnia, and subsequently his drinking increased. During this period he was regularly seeing his doctor for unsuccessful treatment of the headaches and skin inflammations. Dissatisfied with Richard’s progress, his doctor recommended psychiatric treatment, which Richard was reluctant to undertake. Then, in late August, 1975, his girlfriend’s father, my friend and colleague Dr Robert C. Parker, recommended that he come to me for hypnotherapy. The first session was, as I have stated, on 9 September, 1975, and there were eighteen further sessions, the most recent being on 10 February this year.

The reality or nonreality of UFOs is hardly my province; I therefore centered my treatment on the patient’s anxiety reaction to the amnesia which formed part of the alleged experience. Since Richard had obviously developed a strong aversion to the thought of reliving the experience, I was forced to attempt a penetration of the amnesia by taking him gradually through the three prime stages of hypnotism: light, medium and heavy, the latter being a state of somnambulism.

The treatment has so far been successful only to a limited degree. As you will notice when you read the transcript of the most recent hypnotic session, there is a point beyond which the patient simply refuses to go – and to try to force him to do so could be dangerous.

Whether the amnesia is a means of obliterating a real experience or an

extremely painful fantasy is, in a certain sense, immaterial; what matters is that the memory appears to be real to the patient and that the climax of the experience, or hallucination, was obviously traumatic. It is therefore to be noted that in the period between the last two hypnotic sessions – during which I attempted by suggestion to break down the patient's resistance to a total recall – his mental and physical condition have degenerated, with a full return of the headaches and skin inflammations. These symptoms have naturally led to a return of the patient's former acute anxiety.

This regression, brought about by the patient's fear of a total recall, has so far made me reluctant to use Sodium Amytal or Pentothal to facilitate the breakthrough. However, should such a breakthrough fail to occur during the forthcoming hypnotic session, which is scheduled for tomorrow, I feel that these alternatives will have to be risked.

Since the events leading up to the period of amnesia are detailed in the enclosed police and doctor's reports – and since these events have been corroborated by the patient's recall under hypnosis – the attached transcript covers only the most recent hypnotic session, during which the patient finally recounted what happened during the period of amnesia. As you will note, there is a point beyond which the patient still refuses to go.

I look forward to seeing you upon your arrival here in London.

Yours fondly,

James S. Campbell

PATIENT: Richard Alexander Watson

AGE: 19 yrs. 7 mths.

SYMPTOMS: Nightmares, attendant insomnia and acute anxiety centered around a three-day period of amnesia.

HISTORY: See attached police and medical reports, both released unofficially and in confidence.

DOCTOR: James S. Campbell

SESSION 18/February 10, 1976

DOCTOR

You are relaxing, relaxing, you are very relaxed. You are sleeping, deep sleep, sleeping deeper, very deep. You are sleeping, very comfortable, relaxed, very relaxed, you are deeper and deeper in sleep, very comfortable, deeper. You are relaxed and comfortable. You are deep, deep in sleep. You are relaxed and you will remember everything and you will answer my questions.

RICHARD

Yes.

DOCTOR

All right, Richard. You are going back to the evening of March 7, 1974. You are going back now.

RICHARD

Yes.

DOCTOR

Do you know where you are?

RICHARD

I am in the car. The woman is beside me. The car has stopped… a roaring

sound… a humming… I don’t know… And the light… Oh, my God, it’s all white! *The whole sky is exploding*!

DOCTOR

It’s all right. It won’t harm you. Calm down. Relax. You can see it. Are you all right? Can you see it?

RICHARD

Yes.

DOCTOR

All right, Richard, we’ve already discussed how you were given a lift by the woman in the Audi, how the car stalled in the middle of Bodmin Moor, how the sky became bright, and how the car was eventually drawn into the large saucer. Before discussing what happened inside the saucer –

RICHARD

I don’t want to remember that.

DOCTOR

Before discussing what happened inside the saucer, I would like to clarify some points about the previous period. I want us to do this, Richard.

RICHARD

Yes.

DOCTOR

I want to start with the emergence of the two smaller, three-foot diameter disks from the larger craft.

RICHARD

Yes.

DOCTOR

You said that the two smaller disks flew around the car as if they were examining it.

RICHARD

Yes.

DOCTOR

Why do you think they were examining the car?

RICHARD

They were humming. They made some whistling sounds… Not whistling… Strange, high-pitched beeping, almost like Morse Code. They made me think of computers. I was thinking of computers. I had the feeling they were examining the car, photographing it, making some kind of calculations.

DOCTOR

That’s a strange thing to think. Why did you think that?

RICHARD

Because of the way the disks circled the car. Because of the sounds they were making. Because they shone lights into the car and the car began to shake and a beam of light fell on the woman’s eyes and made her act strangely.

DOCTOR

She changed when the beam of light struck her?

RICHARD

Yes.

DOCTOR

How?

RICHARD

She was very frightened initially. She seemed paralyzed with fear. Then the beam of light caught her in the eyes and she changed almost instantly. I remember this clearly. I was fascinated by it. The woman gasped and then shuddered, closed her eyes and settled back, then, when she opened her eyes again, she was remarkably calm. She told me not to be frightened. She kept saying, ‘It’s all right.’ She stared at me as if I didn’t exist, and she seemed almost happy. I thought that was strange.

DOCTOR

Why didn’t the light affect you that way?

RICHARD

It didn’t reach my eyes. I doubled over on the seat. The light passed over the back of my head and just burned my neck.

DOCTOR

I see. Please continue.

RICHARD

Then the small disks flew away. They returned to the large object. Each disk

went into a separate opening. Then the panels at each end of the large object winked out, leaving darkness.

DOCTOR

Describe the large object, the large saucer, again.

RICHARD

It was dark, but it grew bigger. It was surrounded by a glowing haze. The colored lights along the bottom started flashing on and off, and I could see the object itself very clearly. It was definitely solid. It appeared to be made of white metal. It had long, narrow windows running right along the front, curving back on both sides, as if running right around the whole object, as if the object was circular. There were people at those windows. I couldn't see them in any detail – they were just silhouettes. They were moving to and fro across the windows, pretty small, faraway. That object, that saucer, was immense. At least three hundred or four hundred feet wide, two or three stories high.

DOCTOR

Fine, Richard. Then the two panels opened again and two more flying saucers emerged.

RICHARD

Yes.

DOCTOR

Describe them, please.

RICHARD

They flew straight at the car. They hovered just above the ground. There was

one on either side of the car and I saw that they were different from the previous ones. They were an awful lot bigger. About thirty-five feet in diameter. Their perimeters swept up to form a dome made of something like glass. There were people inside.

DOCTOR

That's right. You mentioned two crew members.

RICHARD

Two crew members in each saucer.

DOCTOR

How far away was the saucer nearest to you?

RICHARD

The part of the circular perimeter closest to me was about three feet from the car. And the glass dome, maybe Perspex, about fifteen feet away, was just a little above the level of my head.

DOCTOR

You more or less looked directly at the crew members?

RICHARD

Yes, I looked directly at them.

DOCTOR

You are relaxed. You are very relaxed. You have nothing to fear. I want you to remember. I want you to remember it clearly. I want you to tell me what the crew members looked like.

(*The patient does not immediately respond*.)

DOCTOR

There is nothing to fear. You are relaxed. Tell me what the crew members looked like.

(*The patient moves into the present tense*.)

RICHARD

Strange. They look strange. They look strange and I’m frightened.

DOCTOR

There is nothing to fear. You are relaxed. What do they look like?

RICHARD

No lips. A mask. It must be a mask. The cabin dome has a rippling effect, so it must be a mask.

DOCTOR

What else?

RICHARD

It has to be a mask. The nose is metallic. The nose is made of metal – it’s covered in metal – so it must be a mask.

DOCTOR

Go on.

RICHARD

The eyes are just slits. They seem a bit Oriental. I think they're slits, but this could be the rippling effect again. They seem Oriental.

DOCTOR

And their faces?

RICHARD

White. Very wrinkled. Sort of gray.

DOCTOR

White or gray? Be specific.

RICHARD

Sort of gray. Very wrinkled. It looks like dead skin. It doesn't look like human skin at all. I have the feeling it's dead skin.

DOCTOR

Dead skin?

RICHARD

I don't know… It made me think of a corpse.

DOCTOR

Think very hard. Is there anything else you can tell me about the crew members, the pilots?

RICHARD

Oh, Jesus, he's just lifted up his hand! He's lifting I up right now! Oh, Jesus

Christ, *the hand is a metal claw* !

DOCTOR

Easy, relax, deep deep sleep, very deep sleep, very deep, you are very relaxed, you have nothing to fear… Now can you tell me anything else about the pilot?

(*The patient reverts to the past tense*.)

RICHARD

He raised his hand. No hand. A metal claw. A sort of metal replacement.

DOCTOR

A prosthetic hand?

RICHARD

I don’t know what that is.

DOCTOR

Never mind. He raised his hand as you were looking at him. Then what?

RICHARD

I woke up.

DOCTOR

What do you mean, you woke up?

RICHARD

I woke up.

DOCTOR

You weren’t asleep, Richard.

RICHARD

I must have fallen asleep. He raised his hand and then a beam of light hit me and then I blanked out.

DOCTOR

All right, Richard, let’s assume you blanked out. How long do you think you were unconscious?

RICHARD

Not long. Just a few seconds.

DOCTOR

How did you know that?

RICHARD

The saucers were still outside the car. They were still in the same position. The woman was still in the same position. She seemed to be in a trance.

DOCTOR

Fine. What happened next?

(*The patient reverts to the present tense*.)

RICHARD

Oh, God, it’s coming down! The big mother ship’s coming down! Its lights

are all flashing and it doesn't make a sound and it's dropping down slowly, too slowly, not making a sound. Oh, God, *there it is*!

DOCTOR

Where is it?

RICHARD

Oh, God! *Oh, my God*!

DOCTOR

Relax, relaxed, you are relaxed, you are comfortable, you have nothing to fear, you are relaxed, you can tell me.

RICHARD

Yes,

DOCTOR

Where is the mother ship, Richard?

RICHARD

It's settled just above the ground. It's hovering just above the road. It's close to the road, but no on it – it's sitting just above it.

DOCTOR

It's now in front of the car?

RICHARD

Yes.

DOCTOR

It’s straddling the road?

RICHARD

Yes.

DOCTOR

How far away is it?

RICHARD

It stretches right across the road. It’s resting just above the road. It’s about fifty yards from the car and it’s really enormous… Oh, God, *the car’s shaking again*!

DOCTOR

It’s all right, it’s all right, the car’s shaking. Why is it shaking?

RICHARD

Everything’s shaking. The whole car’s going wild. Everything’s flying about inside the car and sticking to the windscreen… I can’t breathe, I’m choking, all this stuff’s flying around me, the car’s shaking and moving forward, no sound, just moving forward, being pulled by the saucers at both sides, being drawn toward the mother ship.

DOCTOR

What’s pulling the car forward, Richard?

RICHARD

The saucers. The saucers on both sides. They're pulling us forward?

DOCTOR

How are they pulling you forward?

RICHARD

I don't know. I think it's the beams of light. The beams of light come from the saucers, they're shining on both sides of the car, and the saucers are moving toward the mother ship and pulling us with them.

DOCTOR

Beams of light or cables?

RICHARD

Not cables. Not rope. Nothing! Just beams of light.

DOCTOR

Do you really believe that, Richard?

RICHARD

Yes, I believe it. The beams of light are drawing us forward and… Oh, Jesus, *it's opening up*!

DOCTOR

The mother ship is opening up?

RICHARD

Yes, the mother ship is opening up. It's splitting along the bottom, just above

the flashing lights… It's *not* splitting open: it's forming a ramp. The bottom part's dropping down to become a ramp leading up into the mother ship and the car is being drawn up and inside… Oh, my God, *it's all white in there*! All those people… *Oh, Jesus*!

DOCTOR

All right, Richard, you are relaxed, very comfortable and safe, deep deep in sleep, very relaxed, very comfortable, peaceful, you have nothing to fear. You are being drawn up into the mother ship, but you have nothing to fear. You are relaxed and can remember everything. You are being drawn up into the mother ship. What happened next?

(*The patient does not immediately respond.*)

DOCTOR

What happened next, Richard?

RICHARD

I'm on the hill. I'm cold. I don't know where I am. I…

DOCTOR

You are not on the hill, Richard. You are jumping ahead. You are in the car with the woman and you are being drawn into the mother ship. Now what happened next?

(*The patient does not immediately respond.*)

DOCTOR

Can you hear me, Richard?

RICHARD

Yes.

DOCTOR

What happened next, Richard?

RICHARD

I'm on the hill. I'm cold. I don't know where I am. I…

DOCTOR

You're skipping ahead, Richard. You are three days ahead. Go back to when you were drawn into the mother ship. What happened then?

RICHARD

Oh, God, it's all white! It's all white! It's so bright! All the people! Silhouettes! This is crazy! Oh, Jesus, oh God, I don't want to! *I don't want to*! *I don't want to*!

DOCTOR

Relax, you will relax, you are relaxed, you have nothing to fear. You are sleeping, deep sleep, sleeping deeper, very deep. You are deep, deep in sleep. You are relaxed and comfortable. You are relaxed and you will remember everything and you will answer my questions.

RICHARD

Yes.

DOCTOR

I want you to tell me what you believe happened during the missing three days.

RICHARD

I don’t know.

DOCTOR

But you think about it a lot?

RICHARD

Yes.

DOCTOR

Would you like to know what happened?

RICHARD

Yes. No! I don’t want to know.

DOCTOR

You just said you would like to know.

RICHARD

I want to know. I don’t want to know. The thought of it frightens me.

DOCTOR

It won’t frighten you if you discuss it. It won’t frighten you anymore. You can remember without feeling any fear. You will remember. You are remembering.

RICHARD

Yes.

DOCTOR

You are in the car. You are in the car with the woman. The car is being drawn into the mother ship and you see the white light. Do you see the white light?

RICHARD

Yes.

DOCTOR

The car is being drawn into the mother ship and you see the white light and silhouettes. Do you see the white light and silhouettes?

RICHARD

Oh, Jesus!

DOCTOR

Do you see the white light and silhouettes?

RICHARD

Oh, Jesus! *Oh, no*!

DOCTOR

You are relaxed, very relaxed, deeply relaxed, there is nothing to fear. You are deep, deep in sleep, you are relaxed, and nothing can harm you. You are all right. You can answer my questions. Do you see the white light and silhouettes?

(*The patient does not immediately respond*.)

DOCTOR

Can you hear me, Richard?

RICHARD

Yes.

DOCTOR

The car is being drawn into the mother ship. You can see the white light and silhouettes. Now I want you to recall everything that happened. Tell me what happened.

RICHARD

All white.

DOCTOR

White?

RICHARD

Everything.

DOCTOR

Please explain that, Richard.

RICHARD

The walls are all white and the place is filled with light and the light is so bright it temporarily blinds me. That’s all I can see. The white walls, the bright haze. The silhouettes are moving all around me, moving in on the car.

DOCTOR

Go on.

RICHARD

I’m starting to see better. The place is really very bright. The silhouettes are men in coveralls, moving in on the car. Most of the men seem very small. They all seem about five feet tall. They’re wearing one-piece coveralls, some black, others a silvery-gray, and they have this sort of gray, wrinkled skin, metal noses, no lips.

DOCTOR

All right. You are comfortable. You have nothing to fear. You say they have metal noses, no lips. Just what do you mean by that?

RICHARD

Metal noses. No lips.

DOCTOR

They’re wearing masks like the other crew members?

RICHARD

I don’t know. I’m not sure. (*The patient reverts to the past tense*.) They looked like masks, but they seemed permanent. The masks covered their nose and the lower half of the chin and seemed to be molded out of a single piece of very thin metal. That’s why there were no lips. The metal covered their lips. I could see the wrinkled skin on their foreheads and around their strange eyes.

DOCTOR

Strange eyes?

RICHARD

Oriental.

DOCTOR

You mentioned that before. Anything else?

RICHARD

The eyes were like the skin – they seemed dead.

DOCTOR

They were blind?

RICHARD

No. They eyes were looking at me, but they seemed dead.

DOCTOR

All right. So these creatures surrounded the car.

RICHARD

Yes.

DOCTOR

What happened then?

RICHARD

They opened the doors of the car and pulled us out.

DOCTOR

They had to pull you out?

RICHARD

I don’t understand.

DOCTOR

Did they have to pull you out because you were frightened?

RICHARD

They didn’t actually pull us out. This creature opened the door and took me by the arm and just sort of assisted me.

DOCTOR

You didn’t resist?

RICHARD

No.

DOCTOR

I thought you were frightened.

RICHARD

I was numb. I think I was numb with fear. I was dazed and felt weak. I got out automatically.

DOCTOR

And the woman did the same?

RICHARD

I don’t know. I wasn’t looking. I assume she did the same. I saw her standing beside me, fascinated, looking around her, smiling with that strange gleam in her eyes.

DOCTOR

Could she have been in a trance?

RICHARD

She could have been. Not quite. She was wide awake.

DOCTOR

Posthypnotic suggestion?

RICHARD

I don’t know what that means.

DOCTOR

It doesn’t matter. The creatures pulled you out of the car. Where was the car?

RICHARD

The car was inside the mother ship.

DOCTOR

You’re sure of that?

RICHARD

Yes. I looked around me and saw the ramp swinging up to form part of a wall. The ramp swung up from the floor. It closed and formed part of the

wall. It didn’t make a sound when it closed, and then I saw the wall properly. The wall was white. It was very slightly curved. It curved horizontally and vertically to form part of a dome. It was only part of the dome. It was shaped like a slice of orange. It was very large, very white, very bright, like part of a painted aircraft hangar.

DOCTOR

What made you think of an aircraft hangar?

RICHARD

I was in an aircraft hangar once. I remember that hollow ringing sound. The car was parked on the kind of ramp that you see in a garage, and the whole place looked like an aircraft hangar, a sort of very large workshop.

DOCTOR

You saw machinery?

RICHARD

Yes.

DOCTOR

What sort of machinery?

RICHARD

I don’t know. I don’t know much about machinery. It just seemed like an aircraft hangar because it had all this machinery and because it was big and sort of echoing. Also, all the men, the creatures, were wearing the coveralls.

DOCTOR

And the curved wall? What did you think it was?

RICHARD

It was just a curved wall. It was the inside of the outer wall of the mother ship, where the ramp had come down.

DOCTOR

Okay. So the car was drawn up the ramp into the mother ship, the ramp was then drawn up to form part of the wall, and the car came to rest on a sort of platform close to the inner wall.

RICHARD

Yes.

DOCTOR

Fine. Now you and the woman are standing beside the car, surrounded by the men, the creatures, in coveralls.

RICHARD

Yes.

DOCTOR

What happened next?

RICHARD

I look at the creatures around me, wondering if they were wearing masks, metal masks, and my fear deepened and I started to shake. The one of the creatures approached me. Oh, Jesus, those dead eyes! He stared at me and passed his hand across my face and then I felt a lot better.

DOCTOR

You weren’t frightened anymore?

RICHARD

I went sort of limp. I mean, I went limp inside. I just emptied out, feeling drained and light-headed, a bit removed from it all. It became like a dream.

DOCTOR

Yet you still felt awake?

RICHARD

I was aware of where I was. It just seemed more distant and unreal, as if I was dreaming.

DOCTOR

Were there any distinct sounds in the hangar?

RICHARD

A humming. A sort of humming vibration. All the time. It was constant.

DOCTOR

Was this similar to what you’d experienced in the car?

RICHARD

Similar, but almost imperceptible. I hardly heard it at all.

DOCTOR

Heard it or felt it?

RICHARD

Both.

DOCTOR

Did the creatures talk to you?

RICHARD

No. No lips.

DOCTOR

They made no sound?

RICHARD

No.

DOCTOR

Go on.

RICHARD

There was an escalator near the car. They made us go up the escalator. One creature walked ahead of us, another stayed behind us, and a third took my elbow and guided me to the escalator.

DOCTOR

What did the others do?

RICHARD

They surrounded the car.

DOCTOR

Why did they surround the car?

RICHARD

I don’t know. I didn’t look back.

DOCTOR

All right. The creature guided you and the woman to the escalator. What then?

RICHARD

The escalator door opened and the creature pushed us inside and followed us in. The other two then followed him in. The escalator took us up past plain white walls to a corridor that curved out of sight.

DOCTOR

The corridor ran parallel to the curved wall of the mother ship?

RICHARD

Yes, I think so. It think it ran around the rim of the whole ship.

DOCTOR

Any windows?

RICHARD

No windows on the right-hand wall, the outer wall, of the corridor. There were doors on the left. These doors were the kind that slide in and out of hollow spaces in the wall – they didn’t swing back on hinges.

DOCTOR

Go on.

RICHARD

Surrounding us, the three creatures walked us along the curving corridor, past a lot of closed doors, and then, when we reached a particular door, the leading creature ordered us to stop.

DOCTOR

Just a moment, Richard. You say the leading creature ordered you to stop?

RICHARD

Yes.

DOCTOR

But you said previously that these men never spoke.

RICHARD

They never spoke. They had no lips. The metal covered their lips.

DOCTOR

Yet you say one of them ordered you to stop.

RICHARD

Yes.

DOCTOR

How did he do that? Did he speak to you?

RICHARD

He didn’t talk. He just told us. I just knew.

DOCTOR

Did you actually *hear* him?

RICHARD

He told us to stop. I must have heard him.

DOCTOR

You think you heard him? You heard a voice in your head?

RICHARD

I don’t know. I just heard him.

DOCTOR

But you’re convinced that this man, this creature, didn’t actually speak?

RICHARD

He didn’t talk. I just heard him.

DOCTOR

Okay. You are standing at one of the closed doors.

(*The patient reverts to the present tense*.)

RICHARD

The door opens. It seems to open automatically. It slides open, disappearing

into a hollow in the wall, and we step through the doorway. The door makes me think of ships. It's like the hatchway of a ship. We step in and the door closes behind us and we're in a dimly lit room, a circular room, the walls white… Oh, my God… *I don't want to*!

DOCTOR

It's all right, you are relaxed, very relaxed, deep, deep in sleep and relaxed. You can see and tell me.

RICHARD

It's eerie.

DOCTOR

Yes. The room is circular and dimly lit.

RICHARD

The wall is white and completely circular. There are beds forming a circle around us. There are people on the beds, ordinary people, men, women and children, and they're all wrapped in surgical gowns and have wires running out of them.

DOCTOR

Wires?

RICHARD

The wires are taped to them. Wires and rubber tubes. All these things trail back to the wall behind the beds and are fixed to machines. The machines have colored screens. Not colored: a sort of monochrome. I thought at first they were colored because I saw lines of bright light jumping up and down.

DOCTOR

Have you ever seen an ECG monitor?

RICHARD

I think so. In the movies.

DOCTOR

Is that what these machines look like?

(*The patient reverts to the past tense*.)

RICHARD

Yes. The room looked like a hospital ward – except for its shape.

DOCTOR

The circular shape.

RICHARD

Yes.

DOCTOR

Okay. Continue.

RICHARD

We were led to the far side of the room and taken through another door, and we entered another circular room, but bigger and brighter. There were a couple of surgical beds – no, like operating tables. There were people around the beds and the walls were all lined with long glass cabinets… *Oh, please*

God, I don’t want to!

DOCTOR

It’s all right, you are relaxed, you are deep, deep in sleep, you are very relaxed and you can tell me, you have nothing to fear. What is it that you didn’t want to do?

(*The patient reverts to the present tense*.)

RICHARD

I don’t want to look at them.

DOCTOR

At what?

RICHARD

I don’t want to look at the glass cabinets.

DOCTOR

Why don’t you want to look? What do you see in the glass cabinets?

RICHARD

People. Naked people. There are naked people in the glass cabinets. The glass cabinets are like coffins, the glass seems to be slightly frosted, and the naked people are lying in the cabinets with tubes running out of them. Oh, God, *I can’t look at them*!

DOCTOR

All right, Richard, it’s all right, you’re relaxed, you don’t have to look at

them. Relax, Richard. I just want to go over something I might have missed. In the room you've just come from, where the people were lying on the beds, did any of those people actually speak to you?

RICHARD

No. They couldn't. They were unconscious.

DOCTOR

And the people in the frosted glass cabinets?

RICHARD

I don't want to look at them!

DOCTOR

It's all right, Richard. You don't have to look at them again. Just tell me: Are they unconscious?

RICHARD

They're unconscious or dead.

DOCTOR

Do you see anything that looks like an ECG monitor?

RICHARD

Yes. There are screens like that above and between the glass cabinets.

DOCTOR

Are the lights on the screens jumping up and down?

RICHARD

Yes.

DOCTOR

Fine. That means they’re alive.

RICHARD

They’re alive. They’re unconscious.

DOCTOR

Fine, Richard. Now tell me about the people in the room. The ones standing around, fully conscious.

RICHARD

They’re ordinary.

DOCTOR

They look like normal human beings?

RICHARD

Yes.

DOCTOR

Please describe them.

RICHARD

The two nearest to me seem pleasant enough. They’re smiling at me and the woman who drove the car. One is tall and slim, white hair, suntanned, I think

in his late forties or early fifties, but his forehead is unlined. It looks unusually smooth.

DOCTOR

That was the only oddity you noticed?

RICHARD

He was ordinary, but his forehead was unlined.

DOCTOR

And the other man?

RICHARD

He has no hair on his head. He looks normal, but he's bald. He seems older than the other man – not much, but a bit older – and the skin on his face seems unreal, as if he's had plastic surgery.

DOCTOR

Do you know what the results of plastic surgery look like?

RICHARD

Yes. I had a friend who was badly burned in a traffic accident.

(*The doctor deliberately reverts to the past tense*; *the patient does the same*.)

DOCTOR

Were there any other people in the room?

RICHARD

Yes. There were four other men, all wearing white smocks and trousers, pretty young, adolescents I think, quite small, foreign looking.

DOCTOR

Explain that, please.

RICHARD

They looked like Vietnamese. Something like that – I wasn't sure. They had peculiar eyes, narrow, Oriental… I'm not sure. It seemed unreal.

DOCTOR

You still felt as if you were dreaming?

RICHARD

I never felt as if I was dreaming. It was just different, somehow. I didn't feel frightened anymore. I felt nothing. Removed from it.

DOCTOR

Did any of these men talk to you?

RICHARD

They talked to the creatures who'd brought us there. They made them all leave. The men in white stood all around us, but they never said anything. The two standing close to us spoke to us.

DOCTOR

The same as before?

RICHARD

Pardon?

DOCTOR

Did you just hear their voices in your head or did they speak to you orally?

RICHARD

They were normal. They spoke to us. They spoke to me and the woman. They were pleasant and they asked us how we felt and I said I felt fine.

DOCTOR

Did you feel fine?

RICHARD

No. I felt weak. I felt very removed. I was confused and I felt half asleep, as if not really there.

DOCTOR

So why did you tell them you felt fine?

RICHARD

I just said it. I didn’t want to upset them.

DOCTOR

What did the woman say?

RICHARD

She didn’t say anything. She just smiled.

DOCTOR

What did the men sound like when they talked?

RICHARD

They sounded normal. They were both speaking English. The younger man, the tall one, had a normal English accent – a sort of everyday American accent – but the older man spoke English like a foreigner. His English was very good, very good, but he had a strange accent.

DOCTOR

What kind of accent?

RICHARD

I don't know. It sounded slightly European. I think it might have been German.

DOCTOR

What else did they talk about?

RICHARD

They talked quite a bit. They wanted to know all about us. Our names, our ages – things like that – and they were very polite. The old man was fairly distant. He watched more than he talked. I had the feeling he was older than he looked, and he seemed pretty cold. The younger man was more informal. I think he said his name was Wilson. He kept asking us how we felt, if we were frightened, and he seemed really pleasant. The woman didn't say anything. I said I felt very tired. The man I think was called Wilson asked me if I knew where I was, and I confessed that I didn't. He asked me if I'd like to know. I said that I would. He walked over to the wall and pressed a button and two white panels slid apart. There was a very large window there. I went over and looked out. I thought at first that what I was looking at was a

painted screen… and then I became really scared.

DOCTOR

It’s all right. There’s no need to be scared. Now what did you see?

RICHARD

Stars.

DOCTOR

Pardon?

RICHARD

Stars. Lots of stars. No real sky – just the stars. No up or down, left or right, just the stars in a blackness. Then the stars moved. The Earth suddenly filled the window. The curved edge of the Earth, wreathed in cloud, blue and white – like those movies the astronauts sent back… It all seemed too fantastic.

DOCTOR

You were above the atmosphere?

RICHARD

Yes. I could see Brazil and the Argentine. We were way up in space.

DOCTOR

Are you sure this wasn’t some kind of an illusion?

RICHARD

Illusion?

DOCTOR

You said that at first you thought it was a painted screen.

RICHARD

At first I thought it had to be. I think I was hoping that. I wanted it to be a painting or a film, because the other thing frightened me.

DOCTOR

What other thing?

RICHARD

Actually knowing that I was up there.

DOCTOR

Did the man at the window say anything at this point?

RICHARD

I asked him where we were. He said we were up in space. He said we were landing briefly in Paraguay and then flying on.

DOCTOR

Flying on to where?

RICHARD

He didn’t say. I didn’t ask him.

DOCTOR

Didn’t you want to know?

RICHARD

I didn’t think of asking. I was frightened. I think I was frightened.

DOCTOR

You said before that you weren’t frightened anymore.

RICHARD

I can’t explain it. I wasn’t as frightened as I should have been. I felt a bit unreal, I felt drugged… but there was fear. A sort of fear in the background. The fear was just there, if somehow distant… I just wanted to please them.’

DOCTOR

You say you felt drugged. Did you feel they had some control over you?

RICHARD

I felt that I didn’t control myself. I felt kind of helpless.

DOCTOR

You were looking down at the Earth. What happened next?

RICHARD

The man, the younger man, pressed the same button and the two panels closed again. Then they took the woman away. I mean, the bald man took her away. I think I must have looked a bit worried, because the younger man tried to reassure me.

DOCTOR

The one called Wilson.

RICHARD

Yes. He told me they wanted to examine the woman and that she wouldn't be harmed. He said that the bald man was going to examine her and that he – I mean Wilson – wanted to examine me. He said it wouldn't hurt. He said it was just routine. I don't know why, but that really reassured me. It seemed a natural thing to do.

DOCTOR

You didn't wonder why he wanted to examine you?

RICHARD

I think I might have. I can't remember it clearly.

DOCTOR

Why can't you remember it clearly?

(*The patient reverts to the present tense*.)

RICHARD

I just can't. I'm trying to think. I'm more tired than ever. I'm suddenly feeling very tired, so I stretch out on the bed.

DOCTOR

Are you still inside the spaceship, Richard?

RICHARD

Yes.

DOCTOR

Has Wilson told you to lie on the bed?

RICHARD

It’s more like an operating table.

DOCTOR

But has Wilson actually told you to lie on it?

RICHARD

I think he must have. I can’t remember. He passes his hand over my face and I lie down. I’m feeling really tired.

DOCTOR

Go on.

(*The patient does not respond* .)

DOCTOR

I said, continue.

(*The patient does not respond*.)

DOCTOR

Can you hear me, Richard?

RICHARD

Yes.

DOCTOR

You are lying on the operating table. What happens next?

(*The patient now alternates between past and present tenses*.)

RICHARD

I woke up.

DOCTOR

You were asleep?

RICHARD

I woke up. I must have been asleep. I am in another room and the man, the one called Wilson, is shaking me awake. This room is very small. It's relatively small. There are only two beds and the woman is on the other bed. She's unconscious. She's wearing a metal cap. There are wires running out of it, their other ends plugged into a monitor above the bed.

DOCTOR

How long were you sleeping?

RICHARD

No time. There is no sense of time. I just feel very drowsy.

DOCTOR

So, the man shakes you awake.

RICHARD

No. He's just there. I waken up. The man doesn't touch me.

DOCTOR

Yes.

RICHARD

He’s still pleasant. He smiles at me. I’m frightened because of the way he’s smiling. It doesn’t seem natural that he’s pleasant, and I feel really scared.

DOCTOR

Did he say anything?

RICHARD

He smiled and then asked me how I felt. I said I felt very tired. He said that was all right, that it was natural to feel tired, and that I had very strong will, great resistance, and would have to come back. I didn’t know what he meant. I said I didn’t understand. He told me that I didn’t have to worry, that I was going home soon. I said I didn’t understand. I asked him where I was. I felt drugged and I asked this automatically, not thinking about it. I asked him where I was. He said if I got up he would show me. I got up and he led me out of the room and we passed through a laboratory.

DOCTOR

A laboratory?

RICHARD

A laboratory. It looked like a laboratory. It frightened me because of what was in there and I tried not to look.

DOCTOR

What frightened you?

RICHARD

The big jars. The things in cages. All the things in the big jars. The big jars were filled with a clear liquid and these things were just floating there. I felt a bit sick. I was even more scared. I didn't recognize half of these things, but I still felt upset.

DOCTOR

You didn't recognize half of the things. What *did* you recognize?

RICHARD

Eyeballs. Tongues. Maybe brains – I'm not sure. Things that looked like liver and intestines… things that made me feel ill.

DOCTOR

Were these items from humans or animals?

RICHARD

I don't know. I didn't look much… There was a corpse on a table, a human corpse, but its head was missing.

DOCTOR

Anything else?

(*The patient does not respond*.)

DOCTOR

Can you hear me, Richard?

RICHARD

Yes.

DOCTOR

You mentioned cages. What was in the cages?

(*The patient does not respond*.)

DOCTOR

It’s all right, Richard. You have nothing to fear. You are asleep, deep, deep in sleep, you are relaxed, you will be calm. You have nothing to fear, you will be calm, relaxed, you are calm. You are relaxed. Can you hear me?

RICHARD

Yes.

DOCTOR

What was in the cages?

RICHARD

Heads… *Human heads*!

DOCTOR

It’s all right, Richard, forget it. You have forgotten it. You are calm, relaxed, you are just passing through. Remember: I want you to remember. Are you still in the laboratory?

RICHARD

We passed the laboratory. We continued along a curving corridor. The man was telling me that I would come back some day and that I should at least see

it.

DOCTOR

See what, Richard?

RICHARD

Where we were.

DOCTOR

You mean you were still in the mother ship?

RICHARD

No, I don’t think I was still in the mother ship.

DOCTOR

What made you think that?

RICHARD

The walls of the corridor were solid rock. They had been hacked out of the rock. The corridor led into a giant workshop with walls of sheer stone. This place was really enormous. Not a mere workshop – a kind of factory or machine-shop, filled with workers and machines.

DOCTOR

What kind of machines, Richard?

RICHARD

I don’t know. Large machines.

DOCTOR

You are in the machine-shop. What else did you see?

RICHARD

The walls were stone or rock. The roof was stone or rock. I think it was underground. In the ground. Maybe deep in a mountain.

DOCTOR

Anything else?

RICHARD

I can’t really remember. I can’t remember it clearly. There were lots of machines, lots of people, hundreds of people, men and women, and there were catwalks running around the stone walls, catwalks above one another, running past what looked like giant computers, past brightly lit rooms. It looked like a factory. An underground factory. The people all worked like automatons. Hundreds of people.

DOCTOR

These people looked like normal human beings?

RICHARD

All the people looked normal.

DOCTOR

What else did you see?

RICHARD

He showed me where we were. He took me up some steps to a platform and then pressed a button. There were steel panels on the wall. The steel panels slid apart. There was a really huge window, like a CinemaScope screen, and the panels slid apart to expose it, and I saw where we were.

DOCTOR

Where were you?

RICHARD

I don’t know. He wouldn’t tell me.

DOCTOR

All right, Richard, what did you see?

RICHARD

Ice.

DOCTOR

I’ll repeat the question: What did you see?

RICHARD

Ice. All ice. Hills and valleys of ice. The sun was shining and it flashed off the ice and the light nearly blinded me.

DOCTOR

Nothing but ice?

RICHARD

No. There was nothing but ice. Ice, maybe snow, a bright sky, very blue, the sun beating down and flashing off the ice and turning the ice into prisms. It was incredibly beautiful. It took my breath away. There was nothing out there but the ice and the bright, flashing light. The ice went out to the horizon. The sky was sheer blue. I looked up at the sky and saw a green valley surrounded by more ice. The ice was everywhere – down below, in the sky – and I stared at it and thought it was beautiful and that really frightened me.

DOCTOR

Why did it frighten you?

RICHARD

Because I knew that it must be another world, that I was far, far away.

DOCTOR

It looked like another world?

RICHARD

It had to be another world. There was nothing like that on Earth. It was simply incredible.

DOCTOR

But the man, this Wilson, refused to tell you where you were?

RICHARD

I asked him. I had to ask him. He wouldn’t tell me.

DOCTOR

What did he say?

RICHARD

He said I would find out soon enough. He said we had to go back now.

DOCTOR

Back to where?

RICHARD

I thought he meant back to the mother ship, but I couldn’t be sure.

DOCTOR

Okay, what next?

RICHARD

He pressed the same button and closed the panels. He said he thought I had seen enough. He said that I wouldn’t remember this, that I might remember some of it, but that whatever I remembered would be confused and wouldn’t mean much to me. Then he repeated that I had great resistance. He said that was interesting. He said that most people forget it, but that I might be different. He thought I was interesting. He wanted me to come back. He said that when I ceased my resistance I would be very useful. After that, we went back along the corridor.

DOCTOR

Wait a minute, Richard. What do you think he meant by all that?

RICHARD

I don’t know.

DOCTOR

You didn’t think about it?

RICHARD

I didn’t remember it.

DOCTOR

All right. You went back along the corridor.

RICHARD

We went back along the corridor, through the laboratory, then into another room. There were a couple of surgical beds. The men in white smocks were there. The leader, the man called Wilson – I think he was the leader – told me to lie down on a bed. It wasn’t a bed: it was an operating table, with a metal cap attached to its headrest. I didn’t want to lie on it. I lay on it and the men moved in around me and then one of them pulled the metal cap down. I didn’t want them to do that. I didn’t want them to *do* that! I tried to resist, but I can’t move as they put the metal cap on my head. I don’t *want* them to do that! *I don’t want to I don’t want to*! I don’t want them to put that on my head, oh please God… *I don’t want to I don’t want to I don’t want to* !

DOCTOR

It’s all right, Richard, you are calm, you are safe, you are relaxed, you are deep, deep in sleep, it’s all right. Are you calm now?

(*The patient does not respond* .)

DOCTOR

Can you hear me, Richard?

RICHARD

Yes.

DOCTOR

What happened next, Richard?

(*The patient does not respond* .)

DOCTOR

What happened next, Richard?

RICHARD

I’m on the hill. I’m cold. I don’t know where I am. I…

DOCTOR

You are not on the hill, Richard. You are jumping ahead. You are on the operating table and they are placing the metal cap on your head. Now tell me what happened.

(*The patient does not respond*.)

DOCTOR

There is nothing to fear, Richard, you can tell me, you will tell me what happened.

RICHARD

I’m on the hill. I’m cold. I don’t know where I am. I…

DOCTOR

Deep, deep sleep, you are deep, deep in sleep, you are relaxed, you have

nothing to fear, you are very relaxed… You are on the operating table. They are placing the metal cap on your head. You have nothing to fear, you are relaxed, you can tell me what happened. What happened, Richard?

(*The patient does not respond* .)

DOCTOR

You can tell me, you have nothing to fear, you are relaxed, you can tell me. What happened, Richard?

RICHARD

No.

DOCTOR

You can tell me, you have nothing to fear, you are relaxed, you can tell me. What happened, Richard?

RICHARD

I didn’t want to lie down. I lay down. I didn’t want to be there. I lay there and the men all stood around me and one of them pulled the metal cap lower. I didn’t want them to do that. I didn’t want them to *do* that! I try to resist, but I can’t move and they’re putting the metal cap on my head. I don’t *want* them to do that! I don’t want to I don’t want to! I don’t want to have that thing on my head, oh please God, *I don’t want to I don’t want to I don’t want –*

DOCTOR

It’s all right, Richard, you are calm, you are relaxed, you are deep, deep in sleep, it’s all right, you can tell me… What happened, Richard?

(*The patient does not respond*.)

DOCTOR

Can you hear me, Richard?

RICHARD

Yes.

DOCTOR

What happened next, Richard?

(*The patient does not respond*.)

DOCTOR

What happened next, Richard?

RICHARD

I’m on the hill. I’m cold. I don’t know where I am. I…

DOCTOR

All right, Richard, we’ll leave it for now. You are in deep, deep sleep, very deep, deep sleep, you are relaxed, you are very relaxed, you are sleeping, deep sleep, In a moment you can wake up. You will remember nothing that has been said between us. You will not remember until I ask you to remember, you are asleep, deep deep sleep. All right, Richard, you are wakening now, you are wakening, wakening slowly, you are very slowly, gradually, wakening. You can wake up, Richard.

CHAPTER NINETEEN

Looking out of the rear window of the large, comfortable London taxi, the first thing that struck Epstein with pleasure was the peculiar beauty of the pearly-gray afternoon light, falling now, through a drifting layer of clouds, on the stately grandeur of Parliament Square, on the Guildhall and Big Ben, on the tourists who milled about on the pavements dominated by statues. Epstein loved the English light. He had loved it since the war. There was something about that mild, misty gray that pacified the most fearful soul.

‘How do you like being back?’ Campbell asked. ‘It’s been an awfully long time.’

‘How long?’

‘About ten years,’ Campbell said. ‘You came over quite a lot in those days. You were a regular tourist.’

Epstein smiled and rubbed his eyes. The taxi was passing the Cenotaph. He gazed at the Foreign Office, at Downing Street and the Treasury Buildings, saw more tourists around Horse Guards Parade, the soldiers stiff in red uniforms.

‘There were a lot of conferences then,’ he said. ‘There isn’t much happening now. The British are very secretive about UFOs, so there’s normally no point in coming.’

‘It’s better in America?’

‘For good and for ill. But once you sort the wheat from the chaff, then, yes, it’s better.’

Sitting beside Epstein in the back of the taxi, wearing a pinstripe suit, polished black shoes and a flamboyant tie, Campbell studied the glittering ring on his finger and nodded judiciously.

‘I know what you mean,’ he said. ‘We British are tight-lipped. The Official Secrets Act blankets all; we’re not as free as we think we are.’

The taxi was pulling out of Whitehall, into the dense traffic of Trafalgar Square, the four lions staring eternally, flocks of pigeons above the fountains, Nelson’s Monument soaring to the cloudy sky, the National Gallery beyond it. Epstein studied the scene with some sadness, recalling other days, better days, when he had felt more assured, his youthful innocence shielding him. Those days were gone forever and would never return. They had slipped away quietly, stealing hopes and good health, leaving him more restless and defeated, overwhelmed by shrinking future possibilities. He didn’t want to think of the hospital. He couldn’t pretend to be that brave. He coughed into his fist and looked out and saw the steps of the church.

‘St Martin in the Fields,’ Campbell said.

‘What are those people doing there?’

‘Some sort of demonstration,’ Campbell said. ‘They often demonstrate there.’

The light was different here, darker, subtly tainted with carbon monoxide: the waste of the traffic that endlessly circled the square and caused chaos in the surrounding West End streets. Epstein rubbed his tired eyes, slumping deeper into his seat, suffering the acute disappointment that comes to old men when they discover that the past has slipped away and cannot be recaptured.

‘It’s a pity about Stanford,’ Campbell said. ‘I’m really sorry he couldn’t come. It’s not like him to miss a trip to London. You must he keeping him

busy.’

‘He didn’t want to come this time,’ Epstein said.

‘Stanford? You can’t be serious.’

‘I’m serious. He didn’t want to come. He’s been a bit obsessed lately.’

‘Don’t tell me he’s in love.’

‘It’s not a woman,’ Epstein said.

‘With Stanford it’s *always* a woman… and our young friend can pick them.’

Epstein smiled. ‘You sound disappointed,’ he said. ‘Anyway, it really isn’t a woman. He’s obsessed with his work.’

‘You mean UFOs?’

‘That’s right.’

‘That doesn’t sound like Stanford.’

‘Stanford’s changed a lot,’ Epstein said. ‘He’s not the man you remember.’

‘You believe the UFOs are real?’

‘Yes, I believe they’re real. And now Stanford… he thinks they’re real as well, and it’s made him obsessed.’

As the taxi slowed down at Cambridge Circus, inching carefully into the traffic, Epstein glanced out and saw the shuffling crowds, the gutters littered with rubbish. The city was less enchanting here, packed with modern shops and fast-food cafes, the pervading grayness no longer romantic, enshrining neglect. Everything changed, Epstein thought, decayed, visibly crumbled, and he turned his eyes away to gaze inward, ashamed of his dark thoughts.

‘Those transcripts were remarkable,’ he said. ‘What’s your assessment?’

‘I agree with you,’ Campbell said. ‘It’s an amazing story. I’ve gone over the tapes time and time again, but can’t come to any kind of conclusion.’

‘Why not?’

‘I’m simply confused. I don’t know what to believe. It’s the most incredible story I’ve ever heard to come out of hypnosis, and I’m afraid it’s left me rather baffled.’

‘Is it a true experience or isn’t it?’

‘It’s a true experience to *Richard*.’

‘But that doesn’t necessarily mean that it actually happened?’

‘No, I’m afraid it doesn’t.’

Epstein sighed and stared out at Tottenham Court Road, feeling weary after his flight from New York to Heathrow, a slight nausea in his stomach, his head throbbing, a little dizzy from jet lag.

‘It’s a very elaborate story,’ he said. ‘He always returns to the exact same story. If the story isn’t true, what can it mean? Why does he *believe* that it’s true?’

‘I’m not sure,’ Campbell said. ‘*Something* traumatic obviously happened to him when he was hitchhiking to Cornwall, and it’s possible that he’s just trying to conceal it.’

‘From himself?’

‘Yes.’

‘Even under hypnosis?’

‘Yes, even under hypnosis. They can be pretty tricky.’

Epstein glanced outside again to see the shops with plate-glass windows, an abundance of tape-recorders and televisions and stereo equipment, the audio and visual stimuli of a society increasingly divorced from its senses. There was input and output. The Western world was being programmed: plug in, turn on and forget that the real world exists… Yet what was the real world? Where did fact and fantasy blend? Young Richard Watson’s experience was real to him – and yet may never have happened.

‘All right,’ Epstein said. ‘Let’s suppose he’s hiding something. He’s been shocked and he can’t face up to it, so he creates his self-protecting fantasy. Yet, if that’s true, what would make him think of UFOs? He’d never *thought* about UFOs before, so why think of them now?’

‘It’s not true that he’d never thought about UFOs before. He thought *occasionally* about UFOs. Like most of us, he’d read about them and discussed them now and then – not often, but he definitely must have done it, so they were there in the back of his mind.’

‘Hardly enough to make him switch on to UFOs to explain his amnesia.’

‘Well, there *is* something else,’ Campbell said. ‘A few weeks back I had a quiet conversation with Richard’s father, and he gave me some interesting information. It seems that Richard’s father – an engineer with British Leyland – was a Royal Air Force navigational pilot during World War Two. When Richard was a child his father used to tell him about the mysterious balls of fire that were seen by a lot of pilots and have since gone down in the literature as the first genuine reports of contemporary UFO sightings. What we’re told, we remember… so Richard could have remembered those UFO stories.’

‘Anything else?’

‘Yes. According to Richard’s father, he used to embellish his stories – just to scare the hell out of young Richard – by telling him that the balls of fire were actually flying saucers, that they were piloted by extraterrestrials, and that the extraterrestrials had a secret base in the Antarctic, from where they made all their forays.’

‘That’s an old UFO myth,’ Epstein said.

‘Precisely.’

‘So you think that this might account for the landscape of ice and snow that Richard talks about?’

‘Yes. There *is* a pattern there. First he remembers the balls of fire, immediately thinks of them as being of extraterrestrial origin, and then associates them with a landscape of ice and snow. This *could* account for his story.’

‘All right. But what would kick it off in the first place?’

Campbell shrugged. ‘Who knows? That’s the area he won’t discuss. As you could judge from the transcripts, there’s a point in his narrative beyond which he refuses to go. That point, obviously, is the actual incident that started the whole business, but he just doesn’t want to face up to it.’

Shifting uneasily in his seat, Epstein rubbed his eyes again, had a spasm of coughing, and felt despair as the taxi turned around Warren Street station, heading for Harley Street. The fantasy and the fact. The dream and the reality. He thought of the mysterious lights outside Galveston, of the enormous disk in the Caribbean, of the deaths and the disappearances and the contradictions in Air Force policy, and he realized that the dividing line was thin and could in truth be a mirage… And yet he had to know. His time was running out. He didn’t want to take his last breath before the truth was revealed to him. Epstein felt a growing rage. He wanted to smash the walls

down. He wanted to do it for Mary, for Irving Jacobs and for himself, for all the researchers who had suffered or passed away while the mystery remained. The taxi turned into Harley Street, stopped in front of Campbell's building. Epstein clambered out, leaving Campbell to pay the driver, and felt a rising impatience.

'Here we are,' Campbell said. 'The home of the brave.'

'How long before Richard's appointment?'

'Twenty minutes,' Campbell said. 'After you, sir.'

He opened the front door, ushered Epstein inside, then led him to the ancient elevator with its polished brass gate. Epstein felt trapped in the elevator, silently cursed its creaking lethargy, was relieved when they stepped out into the upstairs hallway and entered Campbell's suite. Campbell still had the same secretary. She had been with him for fifteen years. Though noticing how much she had aged, Epstein said gallantly, 'You haven't changed a bit, Elaine,' and shook her hand, then he followed Campbell into his office. After closing the door behind him, Campbell pointed to a chair facing the desk. Epstein nodded and gratefully sat down, breathing heavily, coughing.

'That's a bad cough,' Campbell said.

'Yes,' Epstein agreed.

'Did you eat on the plane?'

'Don't remind me,' Epstein said.

'Then a brandy won't do you much harm. Large or small?'

'Make it large.'

Campbell went behind his desk, opened a cupboard below it, pulled out a

bottle of Rémy Martin and two empty glasses. He poured two stiff shots, slid a glass across to Epstein, then sat back and put his feet on the desk, his glass to his lips. Epstein had a sip of brandy, felt it burning down inside him, making his head feel light and bright, his eyes watering slightly. It did him some good, warmed him up, eased his feeling of unease, but it didn't stop the growth of his rage, his increasing frustration. He coughed again and cursed mildly, recall the hospital in New York; they had confirmed what he had sensed all along, but now the truth was tormenting him. One year, maybe two. The doctor telling him this had smiled when doing so. Epstein thought again of what he had learned and then tried to forget it.

'You had another session with Richard,' he said, 'since we talked on the phone. Did you manage to crack him?'

'No,' Campbell said. 'The same routine, the same results. The minute you try to fill in the gaps, he stops giving answers.'

'You tried bullying him into it?'

'Yes. And he panicked. He just won't face up to the missing period, and I can't push too hard.'

'He's coming here twenty minutes from now?'

Campbell checked his wristwatch. 'Fifteen minutes. He's usually punctual.'

'I want to know,' Epstein said. 'I want you to give him the Pentothal. Believe me, James, it's very important to me… We must get him to talk.'

'It could be dangerous,' Campbell said. 'He's not just frightened – he's terrified. I'm not sure what will happen if we force him. The very thought makes me nervous.'

'Listen.' Epstein leaned forward in his chair, placed his glass on the desk, clasped his hands together and spoke urgently, with quiet, clipped precision.

‘This is the most remarkable close encounter case that I’ve come across so far. It *could* be true, and if it is, it’s important. Indeed, it’s more than important – it’s vital – so we have to succeed. I’m not trying to *invent* UFOs. I actually know they exist. I don’t know what they are or where they come from, but I know they’re for real. I’ve seen one myself. Stanford and I saw it together. It was in the Caribbean. It was enormous and bright and very clear, and it was visible a long time. That UFO abducted a scientist. Stanford and I were the last to see him. Now the CIA is breathing down our necks, and their breath doesn’t smell nice. They don’t believe our story – at least they *say* they don’t believe it – but I have reason to think they might actually believe it, and that their concern is really due to the fact that we reported seeing that huge UFO in the Caribbean. Don’t ask me any more for now. I’m begging you, just believe me. Now the CIA is hounding us, they’re calling our story rubbish, and so, apart from natural curiosity, we have good cause to know. Richard might be what we need. He might unlock all the secrets. We have to take the chance – we have to crack him – because we have to find out.’

Campbell stared steadily at Epstein, his eyes bright and searching, then he let his feet fall to the floor and leaned over the desk.

‘You’ve actually *seen* one?’ he asked.

‘Yes.’

‘I can’t believe that.’

‘I repeat: Stanford and I saw it together – and we didn’t imagine it. It was there a long time. There was an old boat beneath it. The UFO cast light and shadow on the boat. It was there. It existed.’

Campbell shook his head from side to side. ‘I can’t believe this,’ he said.

‘I’m not lying,’ Epstein said. ‘I don’t lie. You *know* I don’t lie.’

‘It’s too ridiculous,’ Campbell said. ‘And I don’tjust mean the UFOs.

Richard's whole story is like a dream – a typical dream.'

'Typical? How?'

'Because Richard was *seeing* it. He wasn't involved in it; he was *observing* it. He was on the outside, looking in, observing his own dream. He's not *active* in that narrative. He has no volition or will at all. All his actions are dictated by the other characters, and he never resists. He's not really a participant. He's merely an observer. At no point in the narrative does he display the slightest resistance to the men, or the creatures, he describes: what they will, he then does. It's a denial of responsibility, a repudiation of his own will. It's the classic dream of someone abdicating: the very heart of amnesia.'

'And that's all it is?'

'Probably.'

'Okay, let's assume that it actually happened. Would his total lack of will, in such circumstances, be all that unusual?'

'I don't know what you mean.'

'James, one of the most common aspects of contactee cases is the apparent lack of will, or resistance, on the part of the contactee. Contactees frequently talk of how, though terrified, they felt drawn toward the aliens, felt that they were *obeying* the aliens – even when the aliens appeared not to have actually spoken. Again, just as in Richard's case, the common denominator seems to be a feeling of remoteness, of divorce from the self, with the contactees invariably behaving like zombies. Now, in this particular case we have the same thing. The woman, for instance, is initially terrified, but then, as soon as the beam of light strikes her, she becomes remarkably, unnaturally, calm. Likewise with Richard. The beam of light that strikes the woman misses Richard and therefore leaves him unaffected. However, when the alien raises his hand, or his metal claw, another beam of light strikes Richard and

temporarily renders him unconscious – and this time, when Richard awakens, he still feels fear, but he's also dazed and a bit removed, without much resistance. Thereafter, whenever Richard feels frightened, the aliens simply wave a hand across his eyes and he immediately goes limp and feels remote again. Also, as with other contactees, Richard does what the men tell him to do, but believes that they're not actually speaking to him… Now is that so impossible?'

Campbell folded one hand over the other, his cheeks slightly flushed, his gaze sombre, his interest increasing.

'Are you suggesting a form of hypnotism?' he asked.

'Why not?' Epstein said. 'There's nothing extraordinary about that – and you know its effects. As you yourself have told me, once a person has been conditioned to accept the hypnotic state, a simple phrase or a gesture can be used to put him or her into a trance immediately. Thus, the alien, just has to pass his hand across Richard's eyes to make Richard go into an hypnotic trance – but still awake, his eyes open.'

'That's possible,' Campbell said. 'And you think the beam of light was some kind of hypnotizing device?'

'It could be,' Epstein said. 'There need be nothing especially magical about it. Bear in mind that light and sound can have remarkable mental *and* physical effects on normal people. For instance, a light flickering somewhere in the alpha-rhythm range, between eight and twelve cycles a second, can cause extremely violent reactions in the person exposed to it, including jerking limbs, faintness, lightness in the head, or unconsciousness. It is scientifically possible, therefore, that the beam of light described by Richard was some sort of laser beam that simply flickered on and off at the particular rate which affects the brain's basic rhythmic patterns and encourages hypnosis. As for the strange humming, or vibrating, sounds that also appear to affect the listener, it's a scientific fact that infrasounds, which are just

below the limit of human hearing – hence Richard's uncertainty about whether he heard or *felt* the noise – can affect humans in the same way as flickering lights. Indeed, certain low frequency sounds can lead not only to a change in the brain's rhythmic patterns, but to actual *physical* changes, such as the breaking of glass or the killing of human beings by crushing their insides with pure vibration. Given this, I'm not being particularly farfetched when I suggest that the beam of light, combined with the vibrating sounds, could have led to the initial state of hypnosis.'

'Yes, Frederick, that's feasible.'

'Good. Now while we're still on the subject, there *is* one thing that repeatedly crops up in contactee cases and could possibly tie in with all this. Time and time again we're told about how the so-called aliens pressed the contactee on the side of the neck – either by hand or with a metal device – and thereby rendered the contactee unconscious or temporarily without will. Could this be related to hypnotism?'

'My God, yes, it could… In fact, it's a standard form of hypnotism: the instantaneous technique, or the carotid procedure.'

'Which is?'

'Simple biology,' Campbell said. 'You merely apply pressure to a blood vessel near the ear, thus inhibiting the heart rate, interfering with the circulation of blood to the brain, and rendering the subject dazed and confused, susceptible to hypnotic suggestion.'

'And is there such a thing as *waking hypnosis*?'

'Yes. The subject is wide-awake, knows where he is and what he's doing, but is actually doing what he has been told to do by his hypnotist. Incidentally, on the opposite end of the scale – and this could certainly apply in Richard's case – the subject can be hypnotized when sleeping normally. You simply

attract the attention of the sleeping subject with some sort of physical contact, hypnotize him by repeatedly telling him that he can hear your voice, have him perform what it is you require of him, then very gently put him back to sleep. He will later wake up, as per normal, and know nothing about it.'

'That could have happened to Richard when he awakened on the strange bed and found the man called Wilson standing over him.'

'Precisely.'

'And what about posthypnotic suggestion?'

'What about it?'

'I just thought it interesting that according to Richard's narrative he was told that he would remember nothing that had occurred – or at least that he might remember *some* of it, but that the little he recalled would be confused and probably not make much sense to him. That seems to be what's happened: Richard still can't remember it – it only comes back under hypnosis, but even there, it's pretty vague and disconnected… And there's still something missing.'

'Well, sticking to our hypothesis, yes, that's also quite possible. Assuming that Richard was hypnotized, any instructions to forget what had occurred would certainly make him forget.'

'And there's nothing particularly mysterious about this type of hypnosis?'

'No. Quite routine.' Campbell picked up his glass and had another sip of brandy, then licked his lips and set the glass down and folded his hands again. 'You know, it *is* interesting,' he said. 'According to Richard, the man told him that he had a very strong will, great resistance, and that while most people forgot the experience, Richard himself might remember it – or at least parts of it.'

‘So?’

‘For a start, the remark confirms that the experience has been undergone by other people.’

‘Yes. Richard’s account certainly ties in with a lot of other such cases, most notably the Barney and Betty hill affair of 1961 and the Pascagoula case of 1973.’

‘A great similarity there, certainly. I remember both cases.’

‘That was for a start. What else is there?’

‘Well, dear boy, still leaning on our hypothesis, it’s to be noted that when the woman was hypnotized by the beam of light – assuming, of course, that she *was* hypnotized – she went into what appears to have been a trance, a wide-awake trance, and apparently experienced no more fear. On the other hand, when *Richard* was likewise affected by the beam of light, he became more remote, but did *not* in fact lose his fear. Now this could account for that strange man’s assessment of Richard: that he had very strong will and great resistance. Accepting this, it is then possible that the woman, even if hypnotized, might not remember what had happened to her; whereas a certain kind of person – a person like our Richard – would remember a certain amount under hypnosis. In short, while your so-called aliens can apparently make abductees forget their experiences, their success in this field is rather limited.’

‘And Richard?’

‘Even with Richard, had he not come for hypnosis, he would never have remembered it at all.’

‘Yet his dreams were a sort of recall.’

‘Right,’ Campbell said. ‘Another clue to his resistance. Richard remembered

some of the events in his dreams, but didn't know what they signified. It's also worth noting that his dream – and it was the same dream every time – involves a group of men standing around him while he's lying on a bed, or operating table. From what he's told us, that can only be when he was forced to lie down on the bed and they put the metal cap on his head – the experience he refuses to detail further.'

'Refuses to detail or simply can't remember.'

'Okay,' Campbell said, 'Let's assume that his captors actually existed and that everything we've discussed actually took place. The man called Wilson was obviously intrigued by Richard's unusual strength of will and told him that *he would have to come back.* Let us suppose, then, that the metal cap was a stereotaxic skullcap, that it was used to implant a minute electrode in Richard's skull to reinforce his inability to remember… Now, when one tries to force Richard to recall that particular episode in details, he not only displays considerable stress, but also clutches his head and shakes it with great violence – and later awakens with an extremely bad headache… Is it therefore possible that Richard has been *programmed* to feel pain and fear when he tries to recall that event? And, further, that they want him to return in order to check out the relative success or failure of the implantation?'

Epstein smiled with pleasure. 'You've just come full circle,' he said. 'Now *you're* the one asking questions. You've become a believer.'

Campbell grinned and raised his hands in mock surrender. 'I accept defeat,' he said. 'Now you have me as curious as yourself: another obsessed man.'

'Good,' Epstein said. 'I like to hear that. So, is it possible?'

'Yes,' Campbell said. 'Implantation of electrodes in the brain has been going on for years – overtly in animals, covertly in human beings, with the latter experiments mostly kept secret. What *we* do know at this point is that electrodes implanted in the human brain have been used successfully to

activate both paralyzed and artificial limbs, to control otherwise uncontrollable muscular spasms, such as in Parkinson's Disease, to pacify violent mental patients and prisoners, and even to initial so-called *thought control* between a human controller and a computer. Now, given that any form of human brain manipulation can have frightening social and political possibilities – which is why, for instance, even the Society of Hypnotists is under constant government surveillance – a lot of the experiments on human beings have been conducted behind closed doors, most notoriously in mental institutions and state prisons. The results of such experiments are thus not widely known. Nevertheless, given what has already been accomplished, and what might have been accomplished in secret, it is safe to assume that the sort of programming we're talking about is well within the bounds of possibility.'

'How are the subjects controlled?'

'Well, it's on the record that the reflexes and appetites of various animals have been controlled at a reasonable distance by a controller sitting behind a computer-linked console. These animals can be made to stand up, sit down, eat or starve themselves to death, play, fight, collapse in terror – just about anything. Regarding human beings, we have, to date, only been able to stimulate specific areas of the brain, and do so, reportedly, under immediately visual control. Regarding long-distance control, it's reasonable to assume that the particular response required would be programmed at the time of the implantation – fed into the brain via the computer – and would be limited to one or two responses only. To put it at its simplest – and taking Richard as our hypothetical case – yes, they could have implanted an electrode in his brain and programmed him to feel pain and terror each time he attempted to think of a particular incident. In other words, it's quite possible that when I try to force Richard to recall the skullcap incident, the very thought of it might stimulate the terror and the crippling headaches – a terror and pain caused by the implanted electrode.'

'Another form of hypnosis,' Epstein said.

‘No,’ Campbell said. ‘Total mind control.’

‘You mean that by taking this technology to its ultimate limits we could steal a man’s mind?’

‘That’s right,’ Campbell said.

Epstein stiffened in his chair, suddenly charged with excitement and energy, feeling that he was standing on the edge of a precipice, about to leap across to the unknown. The possibilities were boundless, the implications awesome, and the truth was probably locked in Richard’s mind. They had to pick the lock, had to force the door open. The risk would be great, but the rewards could be greater: the final unraveling of the mystery that now teased the whole world. Epstein shivered, feeling feverish, his head light and bright, no longer drained by fear and depression and thoughts of his grim future.

‘We have to!’ he exclaimed. ‘We have to use the Pentothal! We have to use it during this coming session and find out what happened!’

‘I’m not so sure,’ Campbell said.

‘*We have to*!’ Epstein insisted.

‘It might be too early for that. Too early. Too dangerous.’

‘Damn you, James, it’s important!’

‘It’s not *that* important, Frederick. I mean, you’ve been at this game for thirty years – you can wait a bit longer.’

‘I can’t,’ Epstein said, and felt ashamed as soon as he said it. ‘I have cancer. I have two years at the most. I won’t live beyond that.’

Campbell stared at him, shocked. Both of them: shocked. They stared at one another for a long time, the silence enslaving them. Then Epstein looked

away, keeping his eyes on the floor. He suddenly felt very old, very frail, as if in finally acknowledging what was happening to him, he had made it real.

‘I have to know,’ he said eventually. ‘I can’t die without knowing. As you say, I’ve been at it for thirty years, but now I believe I can solve it. It’s the most important thing in my life. A lot of others have suffered for it. I can’t come this close and let go… and every day it’s more urgent. It’s not just for me. It’s not purely selfish. It’s for Irving and Mary and all the others who were ruined trying to crack it. There’s something going on, James. It’s not an illusion; it’s real. Now my time is running out and I’m close, very close, and I can’t sit back and hope that Richard remembers… I have to know *now*.’

Campbell sighed and stood up, turned away, stared out the window, turned back to face Epstein again, checked his wristwatch and frowned.

‘All right,’ he said. ‘I’ll give Richard Pentothal. After that, no matter what he tells us, I’ll have his head X-rayed.’

He sat down again. They stared silently at one another. The neat room was as quiet as a tomb and neither knew what to say. They both sat there, feeling stricken. They kept checking their wristwatches. They both sat there for a very long time, but Richard never showed up.

CHAPTER TWENTY

When did Kammler and Nebe die? It was a long time ago. They were gassed as they slept in their rooms, and then I had them cremated. I didn't really have a choice. My implants were not perfected. We were still using the Death's Head SS and their obscene forms of discipline. It was shortly after the war. Kammler and Nebe showed much resentment. Powers corrupts and they both had great power and started plotting against me. I could not let this happen. My life's work was reaching fruition. Hidden deep in the immense, frozen wilderness, the colony functioned. Thus I had to get rid of them. Their room doors locked automatically. They never knew all the time they were there that the walls could spit gas. They died on their own beds. The room was aired and they were removed. They were taken to the crematorium in the base of the mountain, incinerated, turned to ash and smoke, leaving me independent.

How ironic was their death! It was a death befitting both. For how many had they themselves sent to the gas chambers during those nightmare years? I think particularly of Kammler. SS General Hans Kammler. Kammler planned the concentration camps, supervised the plans for Birkenau, was responsible for its four great gas chambers and its vile crematoria. A handsome, ruthless man. Energetic and decisive. His gross ambition, and his total lack of scruples, made him someone worth knowing.

August 1943. Hammler was then at his peak. His lust for power had increased every year and he was then almost godlike. Yet that wasn't enough for him. He wanted more and more. Most particularly, he wanted control of the V-2 rockets and all those who worked on them. He had tried for that and

failed. Then Peenemünde was bombed. Himmler suggested to Hitler that Peenemünde had been betrayed, and that his SS should take control immediately. Hitler agreed to this. Himmler now had full control. He immediately moved mass production of the rockets to the caves near Nordhausen. General Kammler was put in charge. He became Himmler's right-hand man. When that happened, I had to do something to protect my own project.

Those were dangerous years. The war was not going well. The Russian offensive was a disaster, Italy had fallen to the Allies, Hitler's physical and mental health was collapsing, and the Reich was in ruins. My own position was no better. As it recall, it was precarious. I now doubted Himmler's sanity and will, and this made me uneasy. The slaves were still being sent to Kiel. From there they were shipped to the frozen wilderness. The great caves were expanding under the ice, but they seemed far away. I wondered if I would ever get there. I no longer trusted Himmler. As disaster followed disaster for the Reich, I saw his brimming hysteria. I still wanted the wilderness. I knew I couldn't depend on Himmler. His hysteria was making him indecisive and that meant he was dangerous. I still wanted the wilderness, I didn't want Himmler there, and I met Kammler in 1943 and was drawn to his ruthlessness.

Kammler knew of my project. Himmler sent him to check it out. I was then at the BMW Platz near Prague, still working unceasingly. I knew the war would soon be lost. I was playing a double game. The game was highly dangerous, very tricky, and I had to be careful. I still badly needed Himmler. His facilities were essential. Yet I knew that he now lived in fear of being found out by Hitler. After all, it was betrayal. Himmler was building his private empire. If the Führer discovered his intentions he would have Himmler executed. Thus Himmler became frightened. In his mild eyes there was frenzy. He had promised to give der Führer great new weapons, and der Führer was restless. I didn't dare complete my saucer. Not until I reached the wilderness. I was frightened that Himmler's growing confusion might make

him give it to Hitler. That would mean the end of everything. The Allies would take it over. As for myself, I would be classed as a war criminal, and probably hanged.

On top of this, there was Schriever. The Flugkapitän was ambitious. Yet another of Himmler's scientific pets, he had the need to impress him. Schriever's eyes devoured my saucer. He was in competition with me. I knew that if the saucer was completed, he would take all the credit. Already I had seen him do this. He had the slyness of a simple man. Himmler insisted that we share the whole project, and I knew what he meant. I was Himmler's secret. The Flugkapitän was not. Once the project was completed I would simply disappear, and then Himmler could offer der Führer my saucer as a German achievement. So, Schriever was a threat. He wanted credit for my achievements. Because of this, I withheld a great deal and understated my progress. Schriever worked from doctored drawings. I gave him enough to make it credible. The Schriever saucer could rise and hover briefly, but it didn't yet fly. I had to let it progress slowly. Not much, but enough. Meanwhile, in the BMW Platz, I quietly finished the real work.

My sole thought was for the wilderness. The hangars were multiplying beneath the snow. Sooner or later, I would have to escape and join the vast, hidden colony. I could not depend on Himmler. His rising panic had made him treacherous. I could see, in his fear and indecision, that he might never leave. I needed another ally. Another man of gross ambition. I met Kammler in the BMW Platz and knew that here was my man.

Kammler was an organizer. He was decisive and ruthless. More importantly, his ambition was boundless, his selfishness total. I worked on him slowly. It took months, but I was patient. Kammler's one thought, at the time, was self-survival, and that's what I played on. He already knew of the secret colony. He was startled and intrigued. I could see, as I unveiled further facts, that he was drawn to the notion. The Reich was crumbling all about him. There were plots and counterplots. The Nazis were devouring their own kind and survival

was difficult. Then, of course, there were the Allies. Kammler knew the war was lost. He also knew that if the Allies took him prisoner they would certainly hang him. Kammler had to get out of Germany. He had to disappear completely. When I knew this, I told him of my plan and he said he would join me.

That same month he went to see Himmler and blatantly lied to him. He painted me in a black light. He praised Schriever to the skies. He claimed that my project was a mess, that I was stealing from Schriever. I was too old, he said. Flugkapitän Schriever was young and bright. He said that Schriever should be given his own project and encouraged much more. Himmler wasn't too sure, but Kammler pressed home his point. He reminded Himmler that the Allied invasion had begun and that he should take precautions. Kummersdorft West should be evacuated. The American and Schriever should be separated. Kammler suggested that I be moved to the mountainous region of Thuringia, and that Schriever be moved to Mahren. It was better that way, he said. Schriever could then work unencumbered. Himmler, now dependent on Kammler, promptly gave his consent.

I was moved out shortly after. At last I was free of Schriever. In Kahla, in the mountains of Thuringia, I completed my major work. Himmler never knew about it. Kammler told him I was useless. Eventually, Himmler turned his attentions away from me and focused them all on young Schriever. That was just what we wanted. We were not concerned with Schriever. I had insured that Schriever's flying saucer project would never succeed.

June 25, 1944. In my office in the research center at Kahla, I talked to Kammler and Nebe. I remember it well. SS General Artur Nebe. A man whose very name suggested terror and the screams from the basements. General Nebe was ice and fire. He had the cunning of a rat. He was a man who did not show his feelings, who worked quietly and ruthlessly. An exemplary record with the Gestapo. Extermination squads in Russia. With such work he had gutted his soul and embraced the unthinkable. Nebe knew

how to survive. He was a master of intrigue. He had trampled on the bones of countless comrades to protect his own skin. A dangerous man, certainly. Also, a cold realist. And that day in my office in Kahla his eyes were wide open.

General Nebe was escaping. There had been an assassination attempt. The Führer had survived the explosion and was now seeking vengeance. The reprisals were terrible. Himmler's men were butchering hundreds. A lot of officers were fleeing for their lives, disappearing forever. General Nebe was such a man. He had been forced to desert. Kammler had told him of what we were doing and he now wished to join us.

Nebe controlled the escape route. His most fanatical SS men joined him. Those men formed the chain that stretched from Kahla to the port in the Baltic. I often watched the trains pull out. The SS cracked their whips. The dogs snapped at the ankles of the children as they wept on the platform. Many came from the concentration camps. Others came from the Lebensborn. We stole children from all over Europe and marked them for slavery. The trains took them to Kiel. The ships and submarines transported them farther. They vanished off the face of the Earth and were not seen again.

Meanwhile, I continued working. My time was running out. The final components for the saucer were in production, but had not yet been tested. The Red Army was in Warsaw. Very soon it would reach the Oder. I had to complete the saucer and test it before the Russians arrived.

Kammler helped me all he could. His authority was considerable. What we didn't have, he took from other scientists and less powerful research centers. Hitler was dreaming of secret weapons. He spared no expense in getting them. All over Germany, even as the bombs were falling, the scientists worked night and day. There was an Atomic Bomb project. There were electrical submarines. There were laser beams and infrared warheads and remote-control systems. The Kaiser Wilhelm Institut. The Forschungsinstitut

of Lindau am Bodensee. From such places I stole what might help to enhance my own project. The swirling energy of the Feuerball. A porous metal called Luftschwamm. In the laboratories of the Kreiselgerate, not far from Berlin Britz, I solved the problems of gyroscopic control and Prandtl's infamous boundary layer. This latter proved to be the breakthrough. The boundary layer was the key. By the end of 1944 we had conquered it and started final construction.

The thought of Schriever amuses me. Perhaps it always will. I look out upon the gleaming ice caps and think of what that man lost. Schriever lived for fool's gold. His saucer designs were all useless. While I finished the real work in Thuringia, he chased phantoms in Mahren. His flying disk was an abortion. All my guidelines had been false. Nevertheless, Schriever they would work, and that's what I wanted. Himmler rarely asked about me. He kept visiting Schriever. The Schriever disk could hover just above the ground, but could do little else. No matter: it was impressive. Schriever thought he could make improvements. He told Himmler that it only needed time and the Reichsführer believed him. That was just what I wanted. It was exactly what I had planned. As Himmler focused all his attention on Schriever's disk, I got on with the real one.

It was a miracle that I managed it. It was a desperate, frantic race. The skies overhead were filled with Allied aircraft, the horizon was smokey. The Ardennes offensive had failed. The Soviets had now crossed the Oder. The Allied armies were advancing in the south and our towns were in ruins. Hitler had moved into the Chancellery. He was preparing his Götterdämmerung. His Reichsführer, Heinrich Himmler, was in panic and had almost forgotten me. Himmler wanted a flying saucer. He wanted Schriever's flying disk. Because of this, I was free to continue without interference. The war raged far away. The smoke thickened on the horizon. We stepped out of our caves to see this, and then we went back to work.

I remember it all vividly. The sounds of labor still reverberate. The great

underground complex at Kahla represented my future. The caves were inside the mountain. From the air they were invisible. Inside them were thousands of slave workers and dedicated technicians. The bright lights stung our eyes. Walls of stone cast eerie shadows. Machines roared and plates of silvery porous metal dangled over our heads. The flying saucer was a skeleton, but it soon grew to fill the hangar. The technicians clambered under its steel ribs, their eyes covered in goggles. The searing white flames of the welders. The laborers sweating under the Perspex dome of the pilot's cabin. The lights beamed down and flashed off the cabin and hazed the slave workers. The great caves dwarfed them all. They were cathedrals carved from stone. The sounds of riveting and welding and drilling reverberated throughout. The men looked very small. They were like ants in an ant-hill. They climbed ladders, crossed catwalks, stood on platforms and girders, now removed from the real world, isolated inside the mountain, working long hours and sleeping little, supervised by Nebe's soldiers.

We kept working night and day. We heard the thunder of distant guns. Every night our trains snaked down the mountain and headed for Kiel. The flying saucer took shape. Its gleaming mass filled the hangar. The final plates were welded around the pilot's cabin and the body was finished. The large saucer hung from chains. It was lowered onto the sturdy legs. The legs housed the four jet propulsion boosters that would aid its ascent. The disk locked onto the legs. The noise echoed throughout the caves. The slaves looked on in silence, their eyes dulled with exhaustion, while the technicians all cheered and applauded, their hands linked in triumph.

As historic day. I will never forget it. I stood beside Kammler and Nebe and felt as if I was dreaming. The enormous hangar doors opened. Light and cold air rushed in. The Kugelblitz, now supported on metal blocks, had its own kind of beauty. We wheeled it out of the hangar. The date was 14 February, 1945. The sun shone upon the base of the mountain, but was darkened by gray smoke. Then the rain and snow came. We had to cancel the test flight. Two days later, on 16 February, the piloted saucer soared to the heavens. It

climbed vertically and gracefully, stopped abruptly and then shot south. It became a winking light above the battlefields, a bright star in the smokey haze.

The next week, we destroyed it.

CHAPTER TWENTY-ONE

The minute he saw the house the pain left, but the fear lingered on. Richard stood by the gate. The gravel path ran through the gardens. The moonlight fell over the flowers, over the Audi car in the driveway, over the Italian tiles that led up to the front door of the elegant Georgian house. Richard pressed his head again. He couldn't believe that the pain had gone. The pain had pulled him from his bed, the voices whispering, urging, and sent him on the next train to Cornwall, determined to find her. Now he shivered with trepidation. The pain had gone, but the fear lingered on. He glanced up at the house in the moonlight and wondered how he had found it. In truth, it had not been easy. She had told him she was from St Nicholas. It was a very small village, he had discovered when he arrived here, and those he had spoken to knew the lady.

He had asked about her in the local pub, feeling dazed, the headache blinding him, and the men with the pints of beer and whiskies had all chattered at once. Aye, lad, they knew the lady, knew the expensive foreign car; the lady and her bloody great car were located just outside the village… And so he had walked here, still dazed, the headache killing him, and now stood by the wide, open iron gates, not believing he'd made it. The headache had gone, but the fear lingered on. Richard kicked the gravel nervously with one foot, then looked up at the large house.

What had he come? He didn't know why he had come. Yes, he knew – because the headaches had defeated him and the voices had urged him. What voices? *The voices*. The voices? Was he mad? Sitting slumped in the train, his head throbbing, he had sensed his own lunacy. Not voices. Couldn't be.

He had gone to the bar carriage. The bar was crowded and the smoke stung his eyes and made his throbbing head worse. And the voices. *I won't listen*! He drank a double Scotch. It burned down inside him, a thin flame, and made him feel better. Yet the headache grew worse. Forced back to his seat, he sat slumped again. Closing his eyes, he tried to block out the voices, but they refused to be silenced. What voices? *I won't listen*! He wanted to scream with pain. The pain was killing him and the voices were whispering and making him dizzy. Five hours on the train. Shadows creeping across the hills. He had glanced once at the moors and closed his eyes and felt the fear breathing over him. What voices? *I won't listen*! The train had pulled into Bodmin. He had disembarked and walked to the village like a man in a trance. Then the smokey pub, the noisy chatter and ringing glasses. He had asked about the lady with the Audi car and they had pointed the way. A short walk through the darkness. The night silent, stars glittering. He had arrived at the gate of the house… and then the headache had gone.

The fear lingered on. It was with him right now. He stood by the open gates and kicked the gravel and saw lights in the windows. The house looked white in the moonlight. It was a converted, eighteenth century manor: elegant, romantic, dreamlike, the stars glittering above it. Richard advanced through the gateway, stopped again and felt the fear. Why fear? There was nothing to fear, and yet he felt it, and shivered. Then he moved forward again, knowing he couldn't turn back now. When he thought of turning back, his head hurt and the voices returned. He was imagining it, of course. He tried to turn back and his head hurt again and the voices returned. Licking his lips, he studied the house and then moved forward again.

Silence. A light breeze. The light breeze hissed through the silence. Richard walked along the broad, curving driveway toward the white Audi. It was definitely the same car. There could be no doubt about it. Richard looked at the car and felt a chill and remembered the white haze. No, he should not have come here. Yes, he had to go on. The voices whispering in his head confirmed the latter as he approached the car. He stopped, glanced above

him, saw the black sky, the stars, felt fear and something else, a sense of wonder, then moved forward again.

He stopped at the car. His fear and wonder had increased. He shivered, felt the ice in the breeze, and reached out to the car. His ran his fingers along the hood. He had to confirm that it was real. Satisfied, he gazed up at the house, the tall windows in white walls. All the lights were on. The whole house was ablaze. He saw velvet drapes, a chandelier, a rich mahogany table. There were lanterns about the front door, a door made of polished wood. The door was open and he thought that was strange and it made him more frightened.

Fear. The inexplicable. He moved slowly around the car. The breeze hissed and chilled the sweat on his brow and made him shiver again. He advanced across the Italian tiles. The fear closed in and held him. He had the urge to turn around and run away, but he just couldn't do it. Then he was on the porch. Italian tiles and potted plants. There were vines writhing along the balustrades then gleamed white in the moonlight. He stood there, uncertain, thinking of Jenny and the doctors; remembered them, forgot them, heard the voices, then walked up to the front door.

Why was the door open? He knew why: she was waiting for him. She had known he would come, somehow known that, and now she expected him.

Fear. The inexplicable. The need to know and the fear of knowing. He reached out and touched the door with his fingertips, lightly stroking it, testing it. The door was real enough. A bright light poured out from inside. He stepped forward and pushed the door farther back and then stepped into the house.

Silence. The hall was empty. Paintings hung from paneled walls. There was a chandelier glittering below the ceiling, illuminating the stairs. Rich carpets, shining glassware. Richard stood there, couched in fear. The stairs ran up to a balcony that was angled around the hall, closed doors concealing numerous other rooms and offering only more silence.

Richard licked his dry lips and looked reluctantly around him. Two varnished doors, one at either side, leading into more rooms. One of the doors was open. Light poured out around it. He knew it was the room that he had seen from the driveway: the room with the velvet drapes and chandelier and rich mahogany table. He took a deep breath, not alone, sensing someone, remembering the silhouettes in the white haze, the woman's red hair and green eyes. Then he walked to the open door. The silence swam out to surround him. He pushed the door back and stepped in and then stopped, feeling even more frightened.

She was sitting at the far end of the table, her red hair tumbling down, the green eyes very bright, even now, at this considerable distance. She was staring directly at him, perfectly still, almost frozen. She was wearing a black evening gown, flowery frills around the sleeves, and her right hand was holding a glass of what looked like red wine. Though a chandelier was hanging above her head, the table was further illuminated with flickering candles.

Yes, Richard was frightened. Her green eyes were insane. She raised her glass and sipped at the wine and then set the glass down.

'I was expecting you,' she said.

'Why?' Richard asked.

'I just knew you were coming,' she said. 'Don't ask me how. I just knew.'

Richard didn't move toward her. He was frightened and confused. He didn't know why he was here, couldn't believe that he was here, felt unreal and divorced from himself, not in charge of his actions. The woman just sat there, staring at him, not smiling. In the black dress, surrounded by flickering candles and antiques, she looked like someone from long ago. Another time, another age. Richard hardly knew where he was. He had the feeling that he had stepped into a dream from which he might not escape. His headache had

gone, but the fear lingered on. He stood there, near the door, staring at her, wondering who had informed her.

‘How did you know?’ he said.

‘I told you not to ask that.’

‘I had to come,’ he said. ‘I just had to. I have to know why.’

She smiled bleakly and raised her glass, sipped more wine, set the glass down. The glass made a sharp ringing sound that made Richard’s heart leap.

‘Why did you have to come?’

‘I’m not sure,’ Richard said. ‘I’d forgotten – I was trying to forget – and then it all rushed back to me. I started having bad headaches. I thought the headaches were going to kill me. I heard voices, or I thought I heard voices, and kept thinking of you. I just had to come. It seemed imperative that I come. I had the feeling, I had this thing in my head, that said to come here would cure me. The headaches were really bad. They drove me out of my apartment. I didn’t know what to do, I couldn’t think of anything else, just… the train… I thought of catching the train, and that made it seem better.’

‘And your headache has gone?’

‘I think so. I hope so.’

‘How strange,’ she said. ‘My headache’s gone as well. It’s very strange… I’m not frightened.’

Her declaration frightened Richard. He glanced nervously around the room. He didn’t know what he was expecting to see, but he had to look anyway. A long wall lined with books. Velvet curtains, framed paintings, various trophies, the glint of bottles and glasses. The long table was illuminated. Her green eyes were slightly shadowed. The shadows deepened where they

swallowed the corners, creating eerie, gargoyle shapes. Richard shivered, feeling cold, wondering vaguely where he actually was. He glanced around him and then stared at the woman, feeling desperate, in need of her.

‘How are you?’ he asked.

‘Pardon?’

‘How are you?’

She looked bemused, brow furrowed, not believing what she had heard, then she put her head back, the hair gleaming, burning red, tumbling over her bare, convulsed shoulders as her laughter exploded.

‘What…?’

‘Oh, my God!’ Her laughter reverberated around the room, a shocking sound, possibly insane, devoid of humor or warmth. ‘Oh, my God, what a question!’

Richard froze where he stood. ‘Shut up,’ he said quietly.

‘*How are you*?’ the woman gasped, getting her breath back. ‘What a question to ask me!’ Then she burst out laughing again. Hysterical laughter.

Richard stepped forward, hardly knowing what he was doing, seeing bright light, deep shadows, glinting glass, flickering candles, the chairs stacked against the table, all empty, there for ghosts, her laughter whiplashing the silence, demented, a jagged sound. He slapped her face. It was a single, precise blow. The laughter ceased as her head jerked to the side, and froze there, green eyes wide. She took a deep breath. She stared at the opposite wall, her eyes unnaturally bright, her lips forming a tight line, holding in a cold fury. Richard stepped back, pulled a chair out and sat in it. The woman stared at the wall, leaning forward, turned sideways, then she straightened up and took a deep breath and touched her cheek with her left hand.

‘You hurt me,’ she said.

‘I’m sorry,’ Richard said. ‘I didn’t know what else to do. You sounded hysterical.’

She touched her cheek again, smiled ruefully, picked her glass up, sipped some wine and then put the glass down and pushed the bottle toward him.

‘Have a drink,’ she said. ‘I think you need a drink. Before the night’s out, you’ll need it more, but you probably won’t get it.’

‘What does that mean?’ Richard asked.

‘I don’t know,’ she replied. ‘I don’t know what any of this means… I only know that it’s happening.’

Richard poured himself a drink, noticed that his hand was shaking, quickly set the bottle back on the table and returned his gaze to the woman.

‘How did you know I was coming here?’

‘I just knew,’ the woman replied. ‘I just had the feeling… a very strong feeling.’

‘You left the front door open.’

‘Yes, I left it open.’

‘You don’t leave a front door open for a mere feeling. It must have been more than that.’

The woman just smiled. Her green eyes were strange. They were bright, but they were looking straight at him as if not really seeing him. Richard felt himself shivering. He reached out for his glass of wine. He picked it up and turned it around and saw the candlelight reflected in it, forming a blood-streaked, yellow eye.

‘Drink it,’ the woman said. ‘It’s not poisoned. It won’t hurt you, I promise.’

Richard drank some wine. He set the glass back on the table. The woman watched him with that strange, bright intensity, her left hand tightly clenched.

‘Where’s your husband?’ Richard asked.

‘He’s not here right now.’

‘Where is he?’

‘I don’t know,’ the woman said. ‘He left me five months ago.’

‘Left you? You mean for good?’

‘Yes, I mean for good. The poor man thought his wife was going mad, so he packed up and left.’

‘So *are* you going mad?’

‘Possibly. I think so.’ She picked her glass up and drank some more wine, then licked the rim with a pink tongue. ‘I rarely sleep these days,’ she said. ‘I get nightmares when I *do* sleep. I get angry, start smashing things up, wreck the place, rip the phones out.’ She set her glass back on the table, lit a cigaret, inhaled, turned her head aside to exhale the smoke, slowly turned back to face him. ‘We had dreadful rows,’ she said. ‘I never knew what I was saying. I just hated him – no reason – just hated him and wanted to get rid of him. I had to be on my own. I don’t know why – I just had to. I wanted to be alone in this mausoleum, where I could wait… wait for something… Naturally, he left me. I could barely live with myself. I had headaches, like migraines, bad dreams, really terrible, then he left me and it all went away and I sat back and waited. I’ve been waiting for five months.’

She exhaled cigaret smoke, let it swirl around her face, a blue haze disguising

her fading good looks, the lines of tension and loss. Yes, she had changed. Her face advertised the fear. Richard now saw a woman much older, quietly mad, disappearing.

‘Waiting?’ he asked. ‘Waiting for what?’

She shrugged, shook her head, studied her glowing cigaret, looked at him as if looking through him, nicked ash to the floor.

‘Fucked if I know,’ she said. ‘I just know there’s something happening. Last night I had a headache, went to sleep and dreamed about you. I woke up and thought my head was coming apart, but I kept thinking of you. I knew then that you were coming. I was convinced that when you came I’d be cured, so I opened the front door.’

‘That’s crazy,’ Richard said.

‘Is it? You really think so? And yet *you* had a headache, it drove you out of your apartment, it compelled you to catch a train to Cornwall, it drove you all the way here… Are we both…? Are we crazy?’

Richard glanced around the room. A nineteenth-century drawing room. The shadows swallowed the corners, crept along the bookshelves, crawled across the floor and faded out against a bright pool of light. Another time, another age. Another age, another place. He sipped his wine and felt the shifting of his mind, slipping away through a black hole. He wasn’t here; he was there – somewhere else, far away – here and there, which were one and the same, divorced from reality. Then he stared at the woman. Her green eyes swam in the shadows: mad eyes, obsessed with what was coming, seeing more than they understood.

‘What happened?’ Richard asked. ‘That day on the moors. I remember the silhouettes in the white haze. Only that. Nothing else.’

The woman licked her upper lip, unfocused eyes wandering, returning, fixing

upon him, looking through him and beyond him, going back, finding nothing.

‘Why ask me?’ she said. ‘I remember no more than you. I woke up three days later, in the car, in the same place, and drove straight home, not understanding what had happened, not really believing it. I remembered the start of it. That huge aircraft in the haze. I remembered the saucers flying around us, the lights beaming in on us. Then nothing. Oblivion. I woke up and you weren’t there. It was dawn and I thought I’d slept there all night, that I’d somehow passed out. So, I drove back here, went to bed and slept all day. I got up, had some food, watched TV, and found out that three days had passed. Then the headaches started. The nightmares, the fear. When my husband asked me where I had been, I told him to fuck off. Later, when he tried to make love to me, I flinched with revulsion. I couldn’t understand it. I just knew I had to get rid of him. I had fits and started wrecking the house, and he left me eventually. It was easier after that: no more nightmares, no headaches. Just people… I couldn’t stand to see people, so I stayed in the house. I just hung around all day. I drank a lot and that helped me. I knew something was happening, *would* happen, but I didn’t know what. No nightmares, no fear. That all started again last night. I knew then that it had happened, that it hadn’t been a dream, and I knew that you would come here tonight and that soon it would end.’

‘*What* would end?’ Richard asked.

‘I don’t know. I just know it will end.’

She stubbed her cigaret out, picked her glass up, drank some wine, set the glass back on the table, looked at it, then smacked it away. The noise made Richard twitch. He glanced at the table. The glass was lying on its side, reflecting the candlelight, still rocking slightly from side to side, the red wine pouring out across the table and dripping down to the floor. Richard looked at the woman. She stood up and smoothed her dress. She was tall and slim, her face pale and fatigued, still elegant, her hair gleaming in the light, falling onto her shoulders.

‘Did the police come?’ Richard asked.

‘The police?’ She looked puzzled. ‘No, not the police… Some men came, wearing black suits. Briefcases… From the government… Took notes.’

‘About a week after it happened?’

‘No. About a month. They said it was just routine. They took notes. I haven’t seen them since then.’

‘They came *a month* after the event?’

‘That’s right. A good month.’

‘What did you tell them?’

‘I told them what I remembered about the incident. I don’t think they believed me.’

Her gaze was steady, but unfocused. She was still standing in front of her chair. The shadows fell across her face, across the swell of her breasts. Richard stared at her, mesmerized. She moved slightly and the light from the chandelier fell upon her hands. Her fingers were locked loosely together, long and thin, a pale web.

‘What did they say?’ Richard whispered.

The woman shrugged. ‘Nothing much. They told me they had seen you, that you’d told them what had happened, that they just wanted to confirm that it was true. I told them what I remembered. It wasn’t much, but they wrote it down. Two men, quietly spoken, polite. I haven’t seen them since then.’

‘You confirmed that it really happened?’

‘I confirmed what I remembered. When I got to the beam of light, they just smiled, not believing a word of it. They said I had seen the planet Venus.

They got in their car and drove off and have not been back since.'

She still stood there, gazing around her, far away, not really present, a ghostly lady in a long, flowing dress, the walls behind her in shadow. Richard couldn't grasp what was happening. His fear blossomed in the silence. He looked up and saw her glittering eyes, their bright, unfocused depths. What was he doing here? What were they both waiting for? Richard thought of standing up and walking out, but his head tightened instantly. He knew then that he wouldn't leave. His gaze fastened on the woman's breasts. He breathed deeply and the threatened pain faded and his head felt more normal.

'This is crazy,' he said.

'Yes,' she said, 'it's crazy.'

'I'm frightened, but I don't really know why.'

'It's all right. It's all right.'

Richard felt a sudden chill, remembering the dazzling white haze, remembering that what she'd said at that moment had frightened him more. *It's all right. It's all right*. He recalled the words clearly. He now looked at her green eyes, too bright, surveying the room, and he knew, even through his mounting fear, that in some way he needed her.

'We've been brought together,' he said.

'Yes,' she said, 'I think so.'

'Why?' he said. 'I don't understand.'

'It's all right. It's all right.'

She gently bit her lower lip, staring past him, through the windows, looking up at the black, star-flecked sky, her eyes searching, appealing. A shiver ran

down Richard's spine, made him feel more defenceless. He saw the darkness lying over the lawns outside, a fine line of mushrooming trees. The stars were bright and multitudinous, offering silence, revealing nothing, and he returned his gaze to the woman and felt the fear deepening.

'I feel tired,' he said obliquely.

'It's very tired,' she replied.

'Do I stay here? Is that what I do? I *have* to stay here… the headaches.'

The woman just smiled, a strange smile, not her own. She raised her right hand and stroked her red hair, flecks of steel in her green eyes.

'Yes,' she said, 'the headaches… Something's happening… It's all right… Yes, of course, you have to stay here… We both have to stay here.'

Richard was mesmerized. Her black dress flowed on her body. She was tall, her skin white, very elegant, spectral in the shadowed light.

'Can I sleep here?' Richard asked.

'Yes,' she said. 'You should sleep. You'll feel better.'

They stared at one another. The wind moaned across the lawns. The candles flickered on the table, their light defeated by the light from the chandelier, a larger pool of light around them both: a pool of light in the darkness.

'I'll take you up,' the woman said.

'Thanks,' Richard said. 'I haven't actually brought anything with me… No pyjamas… No towels.'

The woman waved her right hand, a languid, eloquent gesture. 'Don't worry,' she said. 'It's all right. I'm always ready for guests.'

Richard stood up awkwardly, his body aching and weak, glanced up and was blinded by the chandelier, looked away, his eyes sparkling. The corners of the room were dark. Glasses glittered in a cabinet. He saw his shadowy reflection in the glass, a wavering ghost, nonexistent. Then he saw another reflection, a flowing form, incorporeal, felt a chill and turned around and saw the woman advancing slowly upon him.

‘This way,’ she said, touching him lightly as she passed, her long fingers outspread, brushing briefly across his chest, then falling back to her side as she walked on, the dress rustling around her.

Richard followed her out, stepping into the hallway, a pulse beating nervously in his stomach as he walked toward the stairs. The hall seemed very large. It looked bigger than it was. They advanced across the carpet, the woman’s dress rustling lightly, then the woman put her hand on the bannister and calmly walked up.

Richard followed her, feeling strange, more unnerved by her calmness, confused, not really knowing what was happening, wondering if he was still sane. None of this seemed real – not the house, not the stairs, not the lights that bled weakly from the walls and fell over the woman. He reached out for the bannister. It was smooth to his touch. He looked up at the woman, at the swaying of her hips, his gaze traveling along her bare arm to her wrist, the white flesh on the polished wood. She was real. It was happening. They both stepped onto the landing. The woman looked back over her shoulder and smiled enigmatically… then she walked away from him.

Richard followed her, feeling cold, along the balcony, through the shadows, the wall-lamps hanging downward, glowing dimly, a modest aid in the gloom. The woman stopped at a closed door, put her hand out, turned the knob, gently pushed the door open and then stepped back, waving Richard inside. He glanced at her, saw the smile, a strange smile, not her own, then he shivered and brushed past her and stepped in, his should grazed by her breasts.

‘Will this do?’ she asked quietly.

Richard hardly saw the room, just the bed, the covers turned back, a lamp burning on a table beside the bed, a pool of light in the shadows.

‘Yes,’ he said. ‘It’s fine.’

‘You look tired,’ she said. ‘Exhausted. That other door leads to the bathroom. In there you’ll find towels… pyjamas.’

Richard nodded, but said nothing, too nervous, confused, mesmerized by her eyes, by that green, opaque glittering, by the long line of her body, the black dress, the shadowed light all around her.

‘Don’t worry,’ she murmured. ‘It’s all right. It’s all right. Have a good sleep and then you’ll feel better. We’ll just stay here. We’ll wait.’

He wanted to know what she meant, what she thought they were waiting for. He opened his mouth and then closed it again, now afraid of his own voice. The woman stepped forward, put her hand on the doorknob, stepped back and pulled the door as she went, disappeared, the door closing.

Richard stood there in the silence, in a noise that seemed like silence, his ears ringing, the closed door in his eyes, feeling tense and light-headed. He stood there a long time. He heard her walking away. She stopped walking, a door opened and closed, and then the silence was total.

Richard sighed, feeling dazed, still frightened, then turned around to have a good look at the room, a spacious room, neat and comfortable. He studied it carefully, drank it in and saw nothing, just the bed and the lamp on the table in a window-framed darkness. He crossed the room to the window. Feeling nervous, he looked out. He saw the far edge of a patio, a low wall, a few steps, a flat lawn disappearing in the darkness, some trees, a small garden shed. He looked up at the sky. The moon glided beneath the stars. He shivered and turned away, feeling desolate, then went into the bathroom.

He turned the light on. Blue and green tiles, blue rugs. A toilet, a marble bath and a shower, expensive and tasteful. He turned the light off. He didn't feel like a bath or shower. He crossed over to the bed and stood there, then went back to the bathroom. He turned the light on. It was bright and stung his eyes. He used the toilet and then took his clothes off and stepped under the shower.

He turned the water on to hot, let it scald him and revive him, remained there for a very long time, then turned it off, dried himself. He walked out of the bathroom, closing the door behind him; naked, he went to the bed and lay down, sighing forlornly. He lay there for some time, hearing the silence of the house. He heard the wind blowing outside the window, then he turned out the bedside lamp.

The darkness was divided. Moonlight fell in through the window. Richard heard the moaning wind, felt the pounding of his heart, looking up, looking around, seeing the ceiling, the looming walls, his fears multiplying and joining and becoming a blanket. He suddenly felt claustrophobic, rubbed his face with his hands, saw the moonlight trickling over a cupboard and a wicker chair. He lay there, breathing deeply, forcing himself to stay calm. He wanted to get off the bed and leave the room, but he just couldn't do it. What was happening? *Why stay*? He rubbed his face and closed his eyes. He saw the moonlight – or imagined he saw the moonlight – and then it seemed like a dream.

The door clicked as it opened. Richard opened his eyes. He looked around – or imagined he looked around – and saw her shadowy outline. She was standing in the doorway, silhouetted in yellow light. She was naked beneath her nightgown, a short nightgown, transparent, and he saw her slim waist, her broad hips, her long legs parted slightly. She didn't say a word, just stood there, breathing evenly. Richard rubbed his face and then licked his lips and blinked a few times. The woman closed the door and padded toward him and lay down beside him.

Flesh. The warmth of skin. There were dreams within the dream: the

moonlight falling on the white sheets, on the edge of a pillow, on a flash of red hair, the gleaming eyes, the pink tongue on the wet lips. They came together and merged, their limbs colliding, embracing, warm skin, willing flesh, her flattened breasts, his sweating spine, searching fingers, scratching fingernails, outspread thighs, thrusting groin, a dream within a dream, shadows writhing in the moonlight, rising up and coming down and rolling over and biting like animals… He had to have her, couldn't stop, either dreaming or awake, not caring, not knowing, seeking release from his fear, a child again, helpless, lips and tongue on the nipple, wanting solace, revenge, forgiveness, final answers, his hands searching for her breasts, his belly sliding on her belly, thrusting up, trying to hide himself inside her, sweat and blood, life's reality… Was it really happening? Did it matter? The red hair across his eyes. Her lips sliding down his chest, down his stomach, soft and moist, opening wide to receive him… Release. No more fear. He looked up and saw the moonlight. He closed his eyes and let himself be devoured, flowing out, pouring into her.

The moonlight. The darkness. Stars swimming in the void. He lay back and dissolved and disappeared and defied space and time. To touch and be touched. The beating blood and pounding heart. To touch and to feel and to know and to drift toward peace. He remembered her touch. He awakened, still remembering. He blinked and rubbed his eyes and looked around him, his body still burning.

'It's all right. It's all right…'

Richard saw her in the doorway, her back turned toward him, naked beneath the white transparent gown, slipping out of the room. Then she was gone. He felt her warmth on his skin. He blinked again and looked hard at the door and saw the light on the balcony. Then the fear returned. He sat up straight on the bed. The moonlight fell into the room, met the light from the doorway, illuminating the necklace she had dropped before entering his bed.

The fear slithered in slyly, crept over him, enveloped him, turned to ice that

first froze and then burned to leave him sweaty and shaking. He glanced wildly around the room. The moonlight fell in through the window. He felt the fear and it forced him from the bed and made him rush to the door.

He saw the woman on the stairs, walking down toward the hallway, still naked beneath the white transparent gown, her lean body outlined. Richard watched her, terrified. She moved as if in a trance. The short nightgown rippled over her breasts, on her thighs, as she padded down on long legs. Richard took hold of the bannister, seeing pale light on her face. He shouted at her – someone shouting; someone urging her to come back – but she continued on her way down the stairs, her gaze fixed on the front door.

Richard glanced over the balcony. The lights in the hall were dim. The front door was open, moonlight falling on the hall, a small figure silhouetted on the porch outside, featureless, not moving.

The fear grabbed Richard and crushed him, made him step back from the bannister, pressing his spine to the wall and glancing around him, paralyzed, his head spinning. Then he suddenly moved again. He felt a need to touch the woman. She was real, a vibrant presence, flesh and blood, and she was all that he had. Richard hurried toward the stairs. He saw the woman in the hallway. The figure standing on the porch had disappeared, but the moonlight still poured in. Richard cried out again. The woman didn’t respond. Richard hurried down the stairs, his heart pounding, as she walked out the door.

Richard froze again. He held the bannister with one hand. He looked down at the door, at the moonlight, the fear slicing through him. Then he moved again, scarcely knowing that he was doing so, his sole thought for the woman, for her presence, for that touch of reality. He reached the bottom of the stairs. Moonlight fell across the floor. He stepped forward and saw the woman on the lawn, the darkness swimming around her.

Richard walked to the door. The fear was choking him, draining him. He reached the door and stepped out onto the porch and saw the woman ahead of

him. She was in the middle of the lawn. She stopped walking and just stood there. The wind blew around her, pressed the nightgown to her body, her hips and her legs emphasized in singular beauty. Then she slowly turned around. She was looking directly at him. He saw her pale face, her red hair, and her strange, haunting smile.

Richard stood on the porch, felt the wind and its ice. He was draining out of himself, the fear destroying him, dulling his senses. The woman stood there on the lawn. Her red hair blew in the wind. He heard the wind and then he heard the humming sound, *felt* the sound, was crushed by it. He stepped forward slowly, keeping his eyes on the woman. He saw the line of trees behind her, the light appearing beyond the trees, a hazy light that rose and spread out to become a pulsating fan.

'Oh, my God,' Richard whispered.

After that, he said nothing. There was nothing to say. He knew that it had ended, that it was over, and that he could not turn back. No turning: the fear. No resisting: the pain. Richard shook his head and licked his dry lips and stepped onto the lawn.

The woman was waiting for him, her arms hanging down by her sides. He stopped when he was halfway toward her, searched in vain for her green eyes. A trick of light and shadow. Richard blinked and looked again. He saw the smile on her face, that ghastly grimace, but her eyes were missing. Richard shook his head and shivered. He stared hard at the waiting woman. He stepped forward and saw that her eyes were closed, that she was standing there dreaming.

Richard almost stopped breathing. He felt the pounding of his heart. He walked over to the woman and touched her, but her eyes didn't open. Then the fear really shook him. He stared wildly at the sky. He saw the moon gliding under the stars, a few dark, drifting clouds. Richard looked past the woman. He saw the light above the trees. The light pulsated and formed a

hazy fan, a spectral glow in the dark night.

Richard started to weep. The tears rolled down his cheeks. He heard the sound, *felt* the sound, was crushed by it, and he clenched both his fists. Then he saw them coming toward him. They were faceless in the darkness. There were three of them, all of them small, spreading out, walking slowly.

Richard stared at them. The fear slithered down his spine. He forgot the woman by his side, forgot Jenny and the doctors, thought of nothing but the dread that was embodied in the men coming toward him. The tears rolled down his cheeks. He saw his history dissolving. He watched the men spreading out, coming toward him, and he knew he must join them. His grief and fear combined. His head tightened and throbbed. The men advanced out of the darkness, the light fanning out behind them, their shadows shifting and falling before them, creeping over the damp grass. Richard stood still. The men approached him and stopped. They were small and they wore silvery masks and were encased in gray coveralls. Richard stood there, transfixed. One of the men walked up to him. The man reached up and touched Richard's neck and the fear fell away from him.

'Yes!' Richard said.

CHAPTER TWENTY-TWO

New York in December was a bitch of a city, the wind blowing like ice along the canyons of concrete, stabbing at Stanford's eyes and raw face, his Californian blood frozen. He cursed and turned his collar up, saw the bright lights of Broadway, breathed the dust and the exhaust fumes of the traffic, appalled by the clamour. He wasn't in a good mood, hadn't been for a long time; he now lived with a cold, suppressed rage that often threatened to choke him.

'New York,' he murmured. 'Shitsville.'

He didn't know what was happening to him, was lost in his obsessions, haunted by the lights of Galveston, by the girl on the porch, by what he had witnessed in the Caribbean, by the mysteries that increased every day and made sleep more difficult.

Stanford felt the freezing wind. He cursed again and walked faster. The traffic ran along Broadway, lights flashing, horns honking, the sidewalks crowded with junkies and prostitutes and pimps, passengers tumbling out of cabs, out of restaurants and theaters, the neon signs winking brilliantly in the night, a kaleidoscopic display. Stanford studied it with distaste. He had never liked New York. He cursed again and then turned into a disco-bar, hurrying down the steep steps.

The bar was in a basement, beyond a silver-gleaming arch, past the blond girl who sat behind a desk and cash register. The girl was wearing a negligible halter, her breasts ballooning dramatically, her tanned belly exposed, her

crotch emphasized by hot pants, long legs in black stockings crossed languidly. Green lipstick. False eyelashes. Stanford paid her and went in, passing a man in black leather, the amplified rock music exploding over him, almost deafening him, strobe lights flashing on and off the small stage where a rock group was screaming.

‘Are you alone?’ someone asked him.

‘What’s that?’ Stanford said. He looked around to see a shock of purple hair, rainbow eyes, the girl a cross between an Apache Indian and a Buddhist monk, her lips lined with glitter dust and pouting invitingly, blowing smoke in his face.

‘Thirty bucks,’ she said. ‘Make it fifty for all night. We go to my place and I’ll show you some tricks that you’ll never forget.’

Stanford silently moved on, pushing his way through the crowd, brushing against creamy breasts and jolting asses in hot pants, the air smelling of nicotine and marijuana and sweat, the strobe lights flashing on and off the heads that bobbed up and down frantically. Stanford just kept going, concentrating on the bar. He saw phosphorescent shirts and tight denims and sunglasses, the girls elegant and tatty, displaying tits and belly buttons, the men rattling with necklaces and bracelets, their talk loud and pretentious. Scaduto wasn’t at the bar. Stanford moved on, looking elsewhere. He cut across the dance floor, the band shrieking above him, the dancers gyrating on all sides, asses jolting like pistons. He ducked waving hands and whipping long hair and finally reached the far side. A line of girls held the wall up, looking sexy or limp, and he avoided their eyes and went past them, entering another, marginally quieter room.

The band sounded more distant here, the sound muffled, the talk clearer, customers crushed between a parallel line of booths that led back to a second bar. He saw Scaduto at the bar, unmistakable, flamboyant dressed, wearing a fringed buckskin jacket, very tight purple pants, knee-length boots, a mess of

chains around his neck, hanging over the counter. Approaching him from behind, Stanford, grinning, grabbed a fistful of his long blond hair.

‘What the fuck – ?’ Scaduto yelped.

‘Hi, hotshot,’ Stanford said. ‘Why the hell did you decide to meet me here? I can hardly hear myself speak.’

Swivelling around on his bar stool, Scaduto grinned crazily and slapped Stanford’s shoulder, making the latter release his hair. ‘You old shitface!’ Scaduto exclaimed, patting his disheveled hair down. ‘How you been? Good to see you.’

‘So what are you doing here?’ Stanford said, glancing around him. ‘You’re getting a bit old for this, aren’t you? I mean, these girls… they’re all kids. Jailbait.’

Scaduto rolled his eyes and grinned again, formed his right hand into a fist, pumped it up and down above his groin and groaned loudly, theatrically.

‘That’s the idea,’ he said. ‘A guy doesn’t get any younger. At forty you’re almost put out to grass, and these kids soothe the pain. I like ’em tight, Stanford. God, yes, I like ’em tight! Some day I’m gonna find one so tight, they’ll have to cut my dick off.’

‘You want a drink?’ Stanford asked.

‘I’ve already got one, old pal.’

‘Have another,’ Scaduto said. ‘I’m only in town for one night. Let’s have an old-fashioned reunion. We’ll throw us a big one.’

Scaduto slapped the counter with one hand. ‘Goddammit!’ he exclaimed. What a pleasant surprise. It’s been a long time, old buddy.’

‘What do you want?’ Stanford asked.

‘A bourbon on the rocks will do for now. A chaser to follow my beer. Fuck it, the night’s just begun; let’s have us a good time.’

There was only one barman, moving fast but overworked, serving two or three groups at a time, his head down, his brow furrowed. Stanford tried to attract his attention, failed, tried again, started wondering if the barman was ignoring him or if the noise had just deafened him. Scaduto came to his rescue, getting off his stool to bend over the counter, his long hair falling around his face. ‘Hey, greaser!’ he bawled. ‘What the fuck? Are you jerking off back there?’ The barman glanced at him, face swarthy above a bow tie, glared hard and then recognized Scaduto and broke out in a grin. ‘Does it feel good?’ Scaduto bawled. ‘You got blisters on your fingers? Two bourbons on the rocks, you fucking greaser, or I won’t pay the check.’ The barman grinned and shook his head, poured the drinks, disappeared, and Scaduto grinned at Stanford and laughed as if he just couldn’t stop.

‘Here’s to you,’ Stanford said.

‘Fucking A,’ Scaduto responded. He drank some bourbon and wiped his lips with the back of his free hand, his glassy gaze slipping sideways. ‘Just look at it,’ he said. ‘All that tight cunt, all that honey. I swear, the young aren’t what they used to be – they just can’t get enough of it.’

‘You’re kidding yourself,’ Stanford said. ‘You’re just a middle-aged *roué*. You can’t stand the thought of being forty and now you’re making an ass of yourself. It’s called the male menopause.’

Scaduto leered as he glanced around him, almost falling off his stool, then he reached out and grabbed Stanford’s shoulder and grinned like a lunatic.

‘Damned right,’ he said. ‘I stand unzipped and corrected. I’m a middle-aged prick, a wilting cock, and I’m having a great time. So how are you, Stanford?

What have you been up to lately? How long's it been? Five years? Ten years? I hear you're still working with that guy, Epstein.'

'That's right,' Stanford said. 'I'm still with Professor Epstein. You and I, we last met in '69, as I recall, when you finally left the NICAP.'

Scaduto's stomach was flopping over his broad, glittering belt and his gaudy, flowered shirt was too tight. He was not ageing gracefully.

'Great days,' he said, grinning. 'I had a damned good time. Wandering over the whole country, meeting folk, seeing places, chasing UFOs like they were going out of fashion – a great time, a fond memory.' Clearly drunk already, he almost fell off his stool, but steadied himself and then stared curiously at Stanford's shoulder bag. 'Hey, what you got there, pal?'

'It's just an overnight bag,' Stanford replied.

'Oh, yeah? Carrying anything of interest? Anything I can swallow or smoke or inject? I mean, anything, old buddy, to let my fire and help me through the long night?'

'No,' Stanford said.

'Not to worry,' Scaduto said. He closed one eye and waved a finger across his face, a stage Irishman, far gone. 'We can only go back to my place. I've a few syringes there. A wee nip, a little jab and then it's Heaven, a sublime glide through inner space. You fancy that, old buddy? We might even get some snatch. Something warm and as tight as a glove, to make the dawn look more pleasant.'

'Who knows?' Stanford said.

They ordered more drinks. The cigaret smoke was dense. The room was packed and becoming noisier, people tugging and pushing, colored lights gliding over the walls in surreal, dreamy patterns. Scaduto drank too fast. He

kept ordering more drinks. He was obsessed with the girls, their long legs and plunging necklines, his glassy eyes darting restlessly around the place, his wolfish leer unappealing. Stanford was quietly shocked by him, found it hard to recognize him, was embarrassed to see this forty-year-old man in his juvenile clothes. In truth, he was ridiculous, pathetically trying to fool himself, and Stanford couldn't reconcile the man before him with the one he had known. Scaduto had been with the NICAP for close to twelve years, had investigated UFOs up and down the whole country and built up an admirable reputation. He had left in 1969. He had been in Arizona then. He and Stanford had gone drinking, had painted Tucson red, and had then gone their separate ways without keeping in touch. That's why Stanford was shocked: he couldn't recognize the old Scaduto. The man swaying on the bar stool, talking loudly, leering openly, was a pathetic shadow of his former self, obsessed with drugs and jailbait.

'I'm still at it,' Stanford told him. 'I'm still out there chasing UFOs. I've probably been at it too long. Why did *you* give it up?'

'I thought, fuck it,' Scaduto said. 'That's all: I just thought, fuck it. There was too much coming down, too much flak, and I just didn't need it.'

'What sort of flak?'

'Just flak,' Scaduto said. 'Flak from the left, right and center, day in and day out. A real drag, believe me.'

'I've bought a bottle,' Stanford said. 'Here, fill your glass up… I don't understand. What kind of flak? Who was giving you flak?'

Scaduto swayed from side to side, almost fell off his stool again, but held onto the counter, cursing, and picked up his glass.

'Everyone,' he said. 'Fucking flak from all sides. Who needs the CIA, the FBI, the fucking Air Force? I couldn't take it anymore. Too much shit on my

desk. When they started coming to see me at midnight, I decided to quit.'

'Midnight?' Stanford said.

'Would you believe it?' Scaduto said.

'Who came to see you at midnight? I don't understand that.'

Scaduto glanced at the girl beside him, had a drink, smoothed long hair, gazed down at the bar and started snorting like a horse at the starting post.

'Fucking CIA,' he said. 'Those bastards came to see me. Came at midnight, got me out of my bed, my cock still standing straight. No rough stuff. Just questions. A formality. A mere formality. Sat me naked in a chair, froze my balls and talked quietly, politely, like we're having a business lunch. Very pleasant. Civilized. Didn't mind if I poured a drink. Said, it's your house, you do what you want, we're just here for a talk. Asked me some questions. About my work at the NICAP. Said they'd heard from a friend of a friend that I was digging too deep. Then we had a serious chat. Woke me up. Interesting. They said they hoped I wasn't feeling too tired, but could they make some suggestions. Suggest, I say, I'm breathless. They suggest I clip my wings. They say I shouldn't be mixed up with UFOs, that they don't really like that. I say it's a free country. They agree that it is. They also say they saw some drugs in my bathroom and they're highly illegal. I tell them it's a setup. I say you're setting me up. They tell me that's a nasty thing to say and that I could get ten years. You want me to leave? I say. You want me to leave the NICAP? We wouldn't dream of suggesting such a thing, they say, but now that you mention it… You can do what you want, they say. It's a free country, pal. I can work any place that takes my fancy. It's just that they're worried about those drugs that they found in my bathroom. I say I'm sorry about that. I say I'm truly repentant. They say maybe it's the strain of chasing UFOs that's making you take them. You have a point there, I say. I say I'm gonna resign from the NICAP. They say that's a wise decision, we respect you for that, and maybe, if you really leave the NICAP, we'll forget

what we found here. That's real decent, I say. I confirm that I'm resigning. They both shake my hand, very pleasant, and walk out the door. So, I resign from the NICAP. I get a job with RCA. I forget that I ever knew the NICAP – and those guys never come back. Hallelujah. Peace, brother.'

Staduto burped and glanced around him, smiled beatifically, eyes blinking, then he picked up his glass and stared at it, surprised.

'Fuck,' he said, 'it's empty.'

'Here,' Stanford said, picking up the bottle. 'Have another. It's on me. So what were they worried about?'

He topped up Scaduto's glass, watched him put it to his lips; Scaduto burped and put his glass down, his red eyes slipping sideways.

'Motherfuckers,' he said.

'What bothered them?' Stanford asked.

'Secrets,' Scaduto said, slurring the word. '*Secrets*! I knew things I shouldn't have known. Those sonsofbitches, they knew I'd been to Canada – and they didn't like that.'

'Canada?'

'Right,' Scaduto said. 'Very cold in the forests, very quiet, and at night the winds haunted you.'

'I don't understand,' Stanford said. 'What's Canada got to do with it? They accused you of digging too deep. What did they mean by that?'

Scaduto, more drunk than ever, grabbed Stanford by the arm, leaned closer to him, breathing into his face, and whispered melodramatically, 'So what have you really got in that shoulder bag?'

‘Nothing,’ Stanford said. ‘Some spare clothes, pyjamas, various papers, a calculator, odds and ends… I told you: it’s just an overnight bag.’

‘You’re going somewhere?’ Scaduto asked.

‘I just got here,’ Stanford said.

‘Of course, Stupid of me. Forgot. So what you really got there?’

‘Nothing,’ Stanford repeated.

‘Jesus Christ,’ Scaduto said. ‘A little smoke, a little coke, a little something to shoot up with? What the hell, we can’t go on like this all night – I’ll take just about anything.’

‘I didn’t bring anything,’ Stanford said. ‘I’m only here for one night. Here, have another drink. We’ll find something else later.’

‘Shit, yes, let’s do that.’

Stanford filled Scaduto’s glass and received a nod of appreciation. Scaduto drank deeply, shook his head to clear it, then looked around him again.

‘Sonsofbitches,’ he said. ‘Those sonsofbitches made me leave. I was having a good time at that time, but those bastards just killed it.’

‘Why?’ Stanford asked.

‘My discoveries,’ Scaduto said. ‘Very cold up in Canada, the forests, all that shit in the woods.’

‘What shit?’ Stanford asked.

‘The fucking truth,’ Scaduto said. ‘I found out and I braced them with the facts and so they paid me that visit.’

‘You took the facts to the CIA?’

‘Whistled in like the breeze. You bastards know all about it, I said. You bastards knew all along.’

‘Knew what?’

‘They kicked me out. Took my papers and kicked me out. They said don’t come around again, you’re fucking crazy, these are lies, then they paid me that cute midnight visit and made me leave the NICAP. No more research for me.’

‘What research?’ Stanford asked.

‘Hey, listen,’ Scaduto said, grabbing Stanford by the arm, leaning closer and hissing into his face, his red eyes darting left and right. ‘Let’s go back to my place. To hell with these women; they’ll only give us the pox. Let’s get high the clean way. I’ve some really hot shit back there; blow your fucking head off. Okay, buddy? Let’s go!’

He tried standing, but tripped over the lower leg of his bar stool, crashing into Stanford’s shoulder and spinning off and bumping into some other drinkers. Stanford reached out and grabbed him, held him upright, shook his lightly, and he straightened his shoulders and looked around him, outraged by the angry stares. ‘Stupid cunts,’ he said. ‘Standing there right in front of me.’ Then he grinned and threw an arm around Stanford. ‘Let’s go, old buddy, let’s get out of here, let’s blow our minds through the roof.’ They made their way back across the packed dance floor, the lone line of lonely ladies, the screaming rock band on the small stage. Scaduto waved to some friends, shouted greetings, his good teeth gleaming, still clinging onto Stanford, unsteady, his face a jigsaw of colors. It took a while to reach the stairs, the crowd thicker than before, the pert buttocks and bulging breasts teasing as they struggled for release. Eventually they made it, stepping under the silvery arch and going up the stairs, Stanford still supporting Scaduto as they stepped

back onto the busy sidewalk.

‘Jesus Christ,’ Scaduto said. ‘All the lights! They’re fucking blinding me. Jesus, I just love it here on Broadway. I love the Big Apple.’

‘Where do you live?’ Stanford asked.

‘In SoHo,’ Scaduto said. ‘I’ve got a little loft in Broom Street. We’ll be there in no time.’

He started off along the sidewalk, swaying dangerously from side to side, and Stanford stuck close beside him, not wanting to lose him. The neon signs flickering crazily, the car drivers honked their horns, and the sidewalks were crowded, people queuing for the theaters, the whores waiting impatiently in the side streets in their come-hither outfits, hopeful clients silhouetted in the bright lights of the stores’ plate-glass windows. Stanford ignored it all, now obsessed with cracking Scaduto, just wanting to get him back to his loft, sober him up, get him talking some sense.

‘These hookers,’ Scaduto said. ‘They sure as hell turn me on. Just look at that little bitch wearing candy floss – I mean, she’s practically naked. What about it, Stanford? You think we should take one back with us? We’ll take that Amazon and share her between us, shoot some stuff, have a threesome.’

‘I’d rather not,’ Stanford said. ‘I don’t like to pay for it. Let’s go back to the loft and shoot up and then I’ll make a few phone calls.’

‘That’s my Stanford,’ Scaduto said. ‘Always in there with the phone book. The most famous phone book in Lover’s Lane and it’s always paid dividends. You had a reputation, Stanford. I’ll have to hand you that. When it came to getting pussy, you could do it, no two ways about it.’

They turned into Broome Street, still close together, passing art galleries and antique shops, health food stores and fresh food restaurants, the old warehouses converted, repainted, decorated, the fire escapes saluting the past,

the bedlam falling behind them.

‘Those sonsofbitches,’ Scaduto mumbled. ‘Those CIA bastards. I’m now earning twice as much as I did before, but it’s just not the same.’

‘A raw deal,’ Stanford said.

‘Damned right, a raw deal. Now I’m a rep’ for RCA and that’s why I’m fucked up.’

‘What worried them?’ Stanford said.

‘What I found out.’

‘What did you find out?’ Stanford asked.

‘Fucking Canada. My *God*!

Scaduto stopped at a converted warehouse, almost fell against the wall, straightened up and plunged his hands in his pockets and eventually withdrew a door key. He had trouble finding the keyhole, kept cursing and mumbling, eventually managed to get the door open and stagger inside. Stanford followed him in, opened the gates of the elevator, a large elevator once used for heavy goods, now used only by residents. Scaduto swayed as they went up, holding languidly to the gate, tried to open it when the elevator stopped, then had to let Stanford do it. The door opposite was large and ugly, the paint stripped off it, paint flaking, but the left behind the door was luxurious, a plush *Playboy*-styled penthouse.

‘Wow!’ Stanford explained. ‘Is this yours?’

‘Shit,’ Scaduto said, ‘I feel sick. I gotta fix myself up.’

He burped and slapped his belly, shook his head to clear it, then made his way along the clean, waxed floorboards of the spacious, rectangular loft. The

walls and ceiling were painted white, stretching away to a wall-length window, the living area located near the window, illuminated by spotlights. Stanford stuck close to Scaduto, ready to prevent him from collapsing; they passed a large, framed Andy Warhol reproduction that covered the right-hand wall, its colors bleached out on their approach to the big window where in daytime the light poured in. Scaduto stumbled and almost fell, but somehow managed not to do so, straightening up and skirting around a modern couch to stop beneath an arched Flors lamp.

‘Christ,’ he said, ‘I feel shitty. I think my head’s stuck up my ass. The room’s spinning, the walls are closing in. What the hell are we doing here?’

‘I want to talk to you,’ Stanford said.

‘You want to shoot up first?’ Scaduto took his jacket off and threw it carelessly on the couch and started rolling up the sleeve of his left arm. ‘Those fucking sonsofbitches killed. They put the fear of God into me. Very nice. Polite. Perfect gentlemen. Planted cocaine in my bathroom.’

‘I thought you took that anyway.’

‘I didn’t have it at the time. I was clean as a whistle, the bathroom was bare, and those bastards had me set for ten years because I hit them with Canada.’

‘I want to talk to you about that.’

‘No way, Stanford, I’m not talking. That bathroom’s note bare anymore and I want to shoot up.’

‘I’m not joining you,’ Stanford said.

‘Then have a drink,’ Scaduto said. ‘Relax. Put your feet up. Watch TV. We’ll call some broads and have us a good time.’

‘I have to know,’ Stanford said.

‘Fuck you, baby, I’m not talking. It never happened. I can’t remember. I know nothing. I won’t talk. It’s not worth it.’

Scaduto finished rolling his sleeve up, slapped and pinched his bared arm, licked his lips and then staggered to the door that led to the bathroom. Watching him disappearing, Stanford felt desperate and outraged, wondering what he could say to this lunatic, his former friend, to shake him out of his stupor. The loft had central heating. Stanford felt uncomfortably warm. He also felt explosive with frustration and had the urge to smash something. It couldn’t happen again: he couldn’t let this one go. He stood there and let the rage take him and shake him awake. Then he cursed and turned around, hurried across the rush matting, hesitated, clenched his fists tight, then entered the bathroom.

Sky-blue walls. Mirrored panels. The bath unit was charcoal brown. Scaduto stood there with one foot on the bath, his knee supporting his elbow. He was tying a tourniquet to his arm. He had one end between his teeth. His fist was clenched and a vein throbbed in his neck, beads of sweat on his forehead. Stanford glanced at the sink. He saw the gleaming syringe. Scaduto grunted and tugged at the tourniquet and then looked up at Stanford.

‘I have to know,’ Stanford said.

The tourniquet slipped from Scaduto’s teeth. ‘What the fuck are you talking about?’ he said. ‘Can’t you see what I’m doing here?’

‘I have a contact,’ Stanford said. ‘A strong CIA contact. He said that you’d found something out that could blow this whole thing.’

‘Fuck off out of here, Stanford. Sonofabitch, that’s why you came. I must be fucking dumb. I should have known. Now just get the hell out of here.’

‘I have to know,’ Stanford repeated.

‘I know nothing,’ Scaduto said. ‘If I knew, I’d have blown it to the media and

made myself rich.'

'You're frightened,' Stanford said.

'Go to hell. Get out of here. I don't know what the hell you're talking about. Fuck off, Stanford. Just leave me.'

'Tell me.'

'I want to shoot up. Jesus Christ, I can't think straight. I've got my head up my ass, my nerves are singing, and you're starting to kill me. I don't know anything, Stanford. I don't remember, I don't care. I'm going to shoot up and you're not going to stop me and that's all there is to it.'

Stanford moved in fast, his left hand swinging sideways, sweeping Scaduto's bent leg off the bath and making his foot slam to the floor. Scaduto jerked forward, following the line of his leg, and Stanford moved in and grabbed him by his long hair and jerked his head back. Scaduto yelped and jerked back up, his head shaking, mouth agape, hands flapping, trying to cover his belly when he saw Stanford's punch. A sluggish gesture, too late: Stanford punched him in the belly. Scaduto doubled up and Stanford grabbed him by the hair and threw him into the wall. Scaduto gasped and seemed to dance, hands waving, legs akimbo, then he groaned, turned around, his hands reaching for the sink, then leaned over the sink and vomited, his body shaking in spasms.

Stanford stood there, feeling cold, far removed from himself. He waited until Scaduto had turned around, and then he hit him again. It was another punch to the stomach, one blow, sharp and brutal, and Scaduto grunted with shock, doubled over, reached out, grabbed Stanford and slid down his legs and then collapsed to the floor.

Kneeling above Scaduto, Stanford rolled him onto his back, grabbed him under the armpits and pulled him up as he mumbled and moaned. He dragged

Scaduto to the shower, inched in backward, laid him down, pushed him into a fetal position and then turned the shower on. Scaduto yelped and wriggled wildly, shocked back to his senses, the water drenching his clothes, forming a pool around him, as he groaned and kicked his legs and waved his arms, a fish flung on the shore. Stanford kept changing the temperature, first hot, then icy cold, and Scaduto opened his eyes and bawled a stream of obscene abuse and slithered around like a drowning rat. He got up on his hands and knees, shaking his head, dripping water, cursed again and tried to crawl from the shower and was pushed back by Stanford. Scaduto howled and waved his hands. He managed to get up on his knees. He was gasping as he swayed from side to side, the water hissing down over him. Stanford turned the shower. Scaduto groaned and flopped forward. Stanford grabbed him and dragged him over the sky-blue tiles, past the bath, through the doorway. Scaduto kicked and waved in protest, sluggish movements, devoid of strength, while Stanford dragged him across the living area, then left him on the floor beneath the couch and stood there and just stared at him.

Scaduto was shivering. He shook his head and groaned and cursed. His fingers scrabbled at squares of rush matting, the steam still rising off him. Stanford stood there, saying nothing, breathing deeply, fists clenched, feeling cold and removed from himself, but now determined to finish it. Eventually Scaduto moved, pushing himself with his hands, shaking his head and struggling up on his hands and knees, a colt learning to walk. He coughed to clear his throat, took a deep breath, turned sideways, then hauled himself on to the couch and slumped there, looking stunned.

Stanford walked across the loft. He had left his shoulder bag on a table. He picked the bag up and unzipped it and pulled out a small tape-recorder. He set the tape-recorder on the table, letting the bag fall to the floor. Scaduto watched him, his glassy eyes wary, still red and unfocused. Then Stanford went back to him, knelt down in front of him, reached out and grabbed him by the shoulder and shook him a little.

‘You’re going to talk to me,’ Stanford said. ‘You’re going to tell me all you know. We’re going to stay here all night, you’re going to talk and keep talking, and we’ll go over it again and again until I’ve got what I need. You don’t have to be formal about it. Just lay it on me as it comes. I’m putting it all on tape, I’m going to cross-check and edit, and when I’ve finished it should be in sequence and sound reasonably intelligent. I’m not bullshitting, Scaduto. I want to drain your brain. I want everything, from your first day to your last, and I want no evasions. If you’re a good boy I’ll reward you: I’ll let you shoot up. If you’re a bad boy, I’ll beat the shit out of you and then start again. And don’t try lying, Scaduto. Don’t leave anything out. If you lie, or if you leave anything out, I’ll go straight to the CIA. I’ll show them what you’ve given me. That should be enough to excite them. They’ll be around here so fast, you won’t know your balls from your ass. So don’t mess with me, Scaduto. Talk long and talk well. If you give me what I need, if it’s believable, I’ll never mention my source. I’m turning the tape-recorder on now. I’m going to sit right here beside you. Just relax, put your feet up and talk, and the night will soon pass.’

Stanford went back to the table, picked the tape-recorder up, bent down and picked up his shoulder bag and then returned to the couch. He sat down beside Scaduto. He reached into the shoulder bag. He withdrew a lot of cassette tapes and set them down on the arm of the couch, where they formed a neat pile. Scaduto stared at all the tapes. He licked his lips and shivered slightly. Stanford picked up the first tape, slipped it into the tape-recorder, turned the machine on and then sat down, looking right at Scaduto.

‘That’s it,’ he said. ‘Talk.’

CHAPTER TWENTY-THREE

‘My phone’s been bugged,’ Epstein said quietly. ‘That’s why we’re out walking.’

It was night time in Washington, DC, and they were strolling through the busy streets of Georgetown, passing discos and restaurants, hopefully anonymous in the crowd. The town looked like a Christmas card in its blanket of snow.

‘Bugged?’ Stanford said. ‘You’ve been *bugged*? Why the hell would they do that?’

Epstein turned his collar up. He looked older and extremely frail. He coughed a lot and rubbed his eyes constantly, rarely raising his head.

‘I’m not sure,’ he said. ‘It must have been done when I was away. I think it has something to do with young Richard Watson.’

‘No one knew about that.’

‘My passport,’ Epstein said. ‘It makes me nervous. They must have us under surveillance. I think it may have started in the Caribbean.’

‘Mr Gerhardt.’

‘That’s right. They’re disturbed about how much we witnessed. I’d like to know why.’

‘Damned CIA.’

‘Yes,’ Epstein said.

‘Where we go, people disappear. It’s not a comforting thought.’

They were in Wisconsin Avenue, passing kids wearing baubles, the outdoor vendors bravely hawking their wares despite the freezing cold. Stanford saw little around him, now buried inside his head, obsessed by the girl in Galveston, by his experience in the Caribbean, by the revelations of Gardner and O’Hara, by Scaduto’s minutely detailed story. Stanford couldn’t leave it now: he was a fish hooked through the throat. No matter what might befall him in the future, he now had to continue.

‘You said Scaduto was sensational,’ Epstein said. ‘All right, let me hear it.’

‘I need my notes.’

‘No, you don’t. You have that famous photographic memory, handed down from your family. All gifted. All with photographic memories. So you don’t need your notes.’

This was true enough. Stanford still had fond memories of his childhood in San Jose, California, the family breakfasts over the long pine table, his mother and brother and two sisters competing noisily with the facts and figures that the five of them all held in their photographic memories. It was a family inheritance, his mother had informed him. Her own mother and her brothers and sisters had all possessed the same gift. And it was that gift, the gift of instant, accurate recall, that had helped Stanford to be a brilliant researcher. So, no, he didn’t need his notes. He remembered Scaduto’s every word, down to the very last, minute detail.

‘I don’t know where to start,’ he said. ‘The whole story’s just incredible – and it’s pretty damned complex.’ He glanced briefly around him, his vision dazzled by the neon lights, hearing the disco music pounding out from

crimson-lit, basement doorway. ‘Okay,’ he continued. ‘The basic background to Scaduto is that he was working for the National Investigations Committee on Aerial Phenomena way back in 1957, when it first started up.’

‘The NICAP,’ Epstein said. ‘A civilian organization. Not too strong a background at all. The outside looking in.’

‘They’re an efficient organization,’ Stanford said, ‘and damned well you know it.’

Epstein smiled, huddled up against the cold, almost lost in his thick, fur-lined coat, the street lights washing over him.

‘So,’ Stanford said. ‘I trust I can now continue… You know, of course, about the Levelland sightings.’

‘Naturally,’ Epstein said. ‘The most remarkable sightings on record so far. November 2, 1957. Seven different automobile drivers, all at different locations around Levelland, Texas, suffered at approximately the same time inexplicable automobile disablement and subsequent recovery after coming across large, egg-shaped, glowing metallic objects that were sitting on the roads before ascending vertically and disappearing. The Air Force later caused themselves acute embarrassment by (a) not examining the reported landing sites; and (b) attributing the cause of the sightings to an electrical storm that was not in fact in the area of Levelland at the time.’

‘Full marks,’ Stanford said. ‘So, the Levelland sightings formed a sort of grand climax to the biggest UFO flap since 1952. Those sightings did indeed cause the Air Force a lot of embarrassment – and led to the NICAP pushing for congressional hearings. In August, 1958, John McCormack’s House Sub-Committee on Atmospheric Phenomena requested a week-long hearing in closed, secret session, but the NICAP’s pleasure in this was quickly squashed. Any hope that the hearing would be a fair one was destroyed by the evidence of Captain George Gregory, then representing Project Blue Book,

who came out with so many half-truths, he made Donald Menzel seem almost Christlike. Given this, as you can imagine, the House Sub-Committee decided to take no further interest in the matter.'

'So?'

'So the members of the NICAP were furious. And they were even more furious when, in December of that year, the Air Force published a staff study that came down heavily on the civilian UFO groups, accusing them of being biased and sensationalist. To make matters worse, it was during the same month that the NICAP learned, through one of the more influential members of the NICAP board, that the Robertson Panel, in making their recommendations back in 1953, had, when discussing civilian UFO groups then in existence, used the chilling phrase: "The apparent irresponsibility and the possible use of such groups for subversive purposes should be kept in mind." And, further, when they discovered that both the FBI and the CIA had been keeping extensive records on people involved in UFO investigations, including quite a few members of the NICAP.'

Epstein nodded wearily, rubbed his eyes and coughed again, looking away in embarrassment when an elegant prostitute started coming toward him. Skipping around her, Epstein and Stanford kept walking, both aware that the prostitute had turned around and was following them, though keeping her distance, possibly still hopeful of some trade.

'Now,' Stanford said, 'stories about the CIA's involvement in the UFO phenomenon had been circulating for years, but a lot of people put it down to paranoia. However, after Gregory's performance in front of the Sub-Committee, and after learning about the Robertson Panel recommendations, some of the members of the NICAP, including Scaduto, decided to check out the situation. Then, just after they began their investigations, one of the members of their board came up with a pretty amazing story.'

The prostitute kept trailing them, swinging her shoulder bag, looking

prosperous in her long coat and boots, as Stanford noticed when he glanced back over his shoulder. Seeing her, Stanford thought of the girl in Galveston, experienced a sudden, shocking lust, and then waved his hand from left to right, indicating 'No.' Glancing back over his shoulder again, he saw the woman shrugging and turning away, prepared to look for trade elsewhere. A neon light flashed green and red, and the snow drifted lazily along the sidewalk as Epstein stared at his own feet.

'Apparently,' Stanford continued, 'just a few weeks earlier – this was 1959 – the Office of Naval Intelligence had heard of a woman in Maine who claimed to be in regular contact with extraterrestrials and brought this fact to the CIA's attention. Since this seemed like a typical crank contactee case in which the woman, a psychic, had used automatic handwriting for communication with the extraterrestrials, the CIA naturally gave it a miss. However, the Canadian government had also heard about the woman and they sent their leading UFOlogist to interview her. According to the Canadian expert, the woman, during a trance, had correctly answered highly complex questions about space flight. Surprisingly, when the US Navy learned about this, they sent *two* intelligence officers to investigate. During the subsequent interview, one of the Navy intelligence officers, who had been trained in ESP, tried to tune in to the woman's contactee; this experiment failed, so he and his associate returned to DC and informed the CIA. This time the CIA showed more interest than before and arranged for the ESP-trained intelligence officer to try making contact in CIA headquarters. Six witnesses – two of them CIA employees and one of them from the Office of Naval Intelligence – get together in the office in Washington to observe the results of the experiment – and this time, when the intelligence officer went into his trance, he reportedly made contact with *someone*.'

Stanford glanced at Epstein, trying to gauge his reaction, but his friend was gazing down at the snow-covered ground, looking frail even in his heavy coat.

‘At that point,’ Stanford continued, ‘one of the men in the room demanded some kind of proof that they were in contact with extraterrestrials. The intelligence officer, still in his trance, said that if they looked out the window they would see a flying saucer over DC. The other three men went to the window and were amazed to see a UFO in the sky – a description of which has never been released. However, it *has* been established that at the time of the supposed sighting, the radar center at Washington National Airport reported that its radar returns had been blocked out in the direction of the sighting.’

Epstein glanced up at the night sky, saw dark clouds drifting lazily, lowered his gaze and stared forlornly at the snow, rubbed his eyes, coughed again.

‘So,’ Stanford said. ‘Major Robert J. Friend – who had since replaced Captain Gregory as head of Project Blue Book – was informed of these events by the CIA and asked to sit in on a latter trance session during which, reportedly, nothing unusual took place. Nevertheless, Friend felt that Duke University’s parapsychology lab should investigate both the female psychic and the intelligence officer, which subsequently they did… but their report never materialized, Blue Book released no analysis of the UFO sighting report, the government did nothing about the Washington radar blackout, and what the intelligence officer saw over DC remained a tight secret. Not only that, but the CIA then took, quote, “punitive action” against the men involved, and had them transferred to other positions in other locations.’

‘That story is authentic,’ Epstein said. ‘Major Friend wrote about the whole affair in a Memorandum for the Record – a memorandum that can now be found in the Air Force Archives at Maxwell AFB, Montgomery, Alabama.’

‘Right,’ Stanford said. ‘And that’s exactly what got Scaduto going… First, Scaduto wondered at the unusual amount of official interest shown in a civilian female with supposed telepathic abilities. Scaduto was aware that the Russian KGB and the CIA had both been investigating the espionage potential of telepathy, psychic photography and other forms of

parapsychology, and he therefore wondered if there could be any connection between that fact and the female psychic from Maine. Since communication by telepathy had already been achieved with moderate success both in Russian and American laboratories, and between submarines and land bases, it was possible that the CIA was genuinely concerned with the woman's knowledge of the more complex aspects of space flight. It also stands to reason, since they themselves were interested in the espionage potential of telepathy, that they would have certain men trained in ESP – thus, they'd sent one of their men to attend the trance sessions.'

'I don't see what this is leading,' Epstein said.

'Patience,' Stanford said. 'The first thing Scaduto had to accept was that telepathic communication had been made with *someone* in that CIA office in Washington, DC, and that the man in a trance, if not actually making it materialize, had been informed that there was a UFO in the sky. If he then kept in mind the fact that certain secret military laboratories had succeeded in training people in telepathic communication – which had been done in primitive fashion years before – it then seemed more believable that the woman from Maine had actually been in contact with some telepathically trained *government* employee.'

'Wait a minute,' Epstein said, looking a lot more interested. 'Are you suggesting that the UFO over Washington, DC, was a *government* aircraft?'

'Yes,' Stanford said. 'And for Scaduto, this possibility became even more intriguing when he thought of the US Navy Intelligence's interest in the matter; and, even more intriguing, when one of the members of the NICAP's board of directors, reminded him that the Canadian government and the US Air Force had both acknowledged their involvement in supposedly unsuccessful flying saucer construction projects.'

Epstein stopped walking, glanced up at the night sky, then looked all around him, at the snow on the ground, at the discos and restaurants and bars, his

eyes bright with excitement.

‘I’m hungry’ Stanford said. ‘Let’s get something to eat. Also, I’m not keen on all this working and I’d like to sit down.’

They went into Clyde’s, instantly savouring the warmth and the saloon atmosphere; once seated, they gave the waitress their orders and didn’t speak again until she left. Stanford studied Epstain’s face: he looked alive, but more alive. Stanford thought of them both, of Epstein’s fate and his own obsessions, and he had to control the cold rage that now drove him relentlessly. His old friend was soon to die. The pains of cancer now assailed him. Stanford wanted to give him something – all the answers – before death cut him down.

‘Okay,’ Stanford said. ‘Bear in mind that at least *some* kind of flying saucer prototypes had actually been built by the US and Canada: first, the US Navy’s Flying Flounder and the Air Force’s Flying Flapjack – projects reportedly worked on between 1942 and 1947 – then the mysterious flying saucer that the Canadian government claimed they had aborted and passed over to the US in 1954. Now, the most interesting thing about those projects was that, one, the US Navy claimed to have dropped their project back in 1947, but were known to be still involved in super-secret aeronautical projects scattered around the White Sands Proving Ground; and, two, the Canadian government, while admitting that the enormous UFO seen over Albuquerque in 1951 was similar to the one they had tried to build, then claimed that they had passed their project on to the US because they couldn’t afford to continue it.’

‘So what you’re saying is that the UFO over Albuquerque might have been a US product based on the 1947 Canadian designs.’

‘Correct… And that everyone who admitted that they’d once tried building flying saucers, were now denying that they’d succeeded. Which could well be a lie.’

‘I see,’ Epstein said.

‘Now remember,’ Stanford continued, ‘that Scaduto had started to investigate these mysteries in the Year of our Lord, 1959. One of the things he remembered was that the first major UFO sightings – the Kenneth Arnold sightings of June 24, 1947 – had taken place near Mount Rainier in the Cascades in the state of Washington – which divides Canada from Oregon – and that Arnold had stated that the *nine* UFOs had flown off in the direction of the Canadian border. What is *not* so widely known is that on the very same day another man, Fred Johnson, prospecting about four thousand feet above the Cascades, reported seeing six similar objects, and that three days before, on June 21, Harold Dahl, on harbor patrol in Puget Sound – which runs from the Canadian border to Tacoma – was following the coastline of Maury Island when he reportedly saw five UFOs maneuvering about fifteen hundred feet above the coast before disappearing toward the open sea. Throughout that whole month – even ignoring the crank reports encouraged by the initial sightings – there was a disturbing number of sightings over the northwest corner of the United States; and by the first week in July there were reports of, quote, “strange, luminous bodies” in the skies over the Province of Quebec, Oregon, and New England. The following week those sightings spread to California and New Mexico, and by the end of that year – the same year that the US Navy had, apparently, *dropped* their flying saucer project – flying saucers were being reported from all over the world.’

‘So you’re suggesting that the US Navy, the US Air Force and the Canadian government were all working together to build those saucers.’

‘Yes,’ Stanford said. ‘The next major flap was the Washingto, DC, flap of 1952. On reinvestigating the case, Scaduto found that while the real flap had begun on July 19, there was a record, dated June 17, of several unidentified red-colored spheres that flew at supersonic speeds over the Canadian Air Base of North Bay in Ontario and then crossed over some of the southeastern states. He also discovered that nearly all of the subsequent DC UFOs were

described as disappearing toward the north, and that when they UFOs returned *en masse*, on July 26, their disappearance in a general northerly direction also applied.'

'All heading toward the Canadian border,' Epstein said.

'Right,' Stanford said.

The waitress brought their food, set it down and smiled at Stanford, did not receive a smile in return and so flounced off in a huff. Epstein had ordered a Spanish omelet and a glass of cold milk; he drank the latter down in one thirsty gulp and then stared at the former. Stanford was distressed, feeling sorry for Epstain's plight, but he picked up his own bacon cheeseburger and sank his teeth into it.

'It adds up,' Epstein said. 'Lake Ontario and Lake Eyrie are as notorious as the Bermuda Triangle for the unexplained destruction of hundreds of aircraft and boats, the failure of gyroscopes and radio instruments, irrational behaviour in normally sane crew members and, of course, the sighting of numerous UFOs. It's also worth noting that Canada, contrary to popular belief, is one of the greatest aeronautical powers in the world, that as far back as 1952 it had been described as the Promised Land of Aviation, that it has a truly remarkable range of world-famous aircraft companies, and that it also has vast areas of heavily wooded and uninhabited land – ideal for hiding secret aeronautical research establishments.'

'That,' Stanford said, 'is what Scaduto found out. So, the next thing he had to ascertain was whether or not the Canadian saucer project had *really* been passed on to the US Air Force and if the Air Force had then simply dropped it.'

'And the answer was both accounts was "No".'

'Correct. His research revealed that on February 11, 1953, the *Toronto Star*

announced that a *new* flying saucer was being developed at the Avro-Canada plant in Malton, Ontario – ’

‘The word “new” suggesting that it wasn’t the first one.’

‘Exactly. Then, on February 16, the Minister of Defense Production, C. D. Howe, informed the Canadian House of Commons that Avro-Canada was in fact working on a, quote, “mock-up model of a flying saucer, capable of flying at fifteen hundred miles an hour and climbing straight up in the air.” By February 27, Crawford Gordon Jr., the president of Avro-Canada, was writing in the *Avro News* that the prototype being built was so revolutionary that it would make all other forms of supersonic aircraft obsolescent. Next, the *Toronto Star* was claiming that Britain’s Field Marshal Montgomery had become one of the few people ever to view Avro’s mock-up of the flying saucer, and short after that Air Vice Marshal D. M. Smith was reported to have said that what Field Marshal Montgomery had seen was the revolutionary construction plans for a gyroscopic fighter whose gas turbine would revolve around the pilot, who would be positioned at the center of the disk.’

Epstein winced with pain, ignored his Spanish omelet and swallowed a tablet; he washed the tablet down with a glass of water and then looked right at Stanford.

‘Good God,’ he said. ‘I think I remember it. The American media dubbed that then legendary machine the *Omega* and in 1953 the *RAF Review* gave it a semi-official respectability by reprinting most of the unclassified Canadian research and including doctored drawings of the machine.’

‘What did it look like?’ Stanford asked.

‘According to the sketches, it was a relatively small, horse-shoe-shaped flying wing, with numerous air intake slots along its edge, ten deflector vanes for direction control, a single pilot cabin topped by a cupola of transparent

plastic, and a large turbine engine that revolved around the vertical axis of the main body.'

'Fantastic,' Stanford said. 'Now listen to this. In early November, 1953, Canadian newspapers were reporting that a mock-up of the *Omega* had been shown on October 31 to a group of twenty-five military officers and scientists; then, in March the following year, the *American* press was claiming that the US Air Force, concerned at Soviet progress in aeronautics, had allocated an unspecified sum of money to the Canadian government for the building of a prototype of their flying saucer, that the machine had been designed by the English aeronautical engineer, John Frost – who had worked for Avro-Canada in Malton, Ontario – and that it would be capable of either hovering in midair or flying at a speed of nearly two thousand miles an hour. This hot bit of news was followed by Canadian press assertions that their government was planning to form entire squadrons of flying saucers for the defense of Alaska and the far regions of the North, and that the machines would require no runways, were capable of rising vertically, and were ideal weapons for subarctic and polar regions.'

'Did the Canadian government make any comment about all this?'

'Not until December 3, 1954, when they suddenly announced that the flying saucer project had been abandoned.'

'Any reason?'

'Oh, yeah. Because, although it was believed that the saucers would fly, they would, quote, service no useful purpose. The Minister of Defense then confirmed their decision, adding that the project would have cost far too much for something that was, in the end, highly speculative.'

Epstein picked up his fork, poked distractedly at his omelet, set the fork down again and glanced around him, his normally weary gaze still excited.

‘All right,’ he said. ‘All these facts merely confirmed what your friend Scaduto had known for some time: that the Canadian government had officially dropped their saucer project in 1954.’

‘I would stress the word “officially”,’ Stanford said.

‘Why?’

‘Because that announcement by the Canadian government was clearly contradicted on October 22, 1955, when the US Air Force Secretary, Donald Quarles, released an extraordinary statement through the press office of the Department of Defense. Among other things he said that an aircraft of “unusual configuration and flight characteristics” would soon be appearing, that the US government had “initiated negotiations” with the Canadian government and Avro-Canada for the preparation of an experimental model of the Frost flying disk, and that the aircraft would be mass-produced and used for the common defense of the subarctic area of the continent.’

Epstein rubbed his eyes, studied his omelet with distaste, then returned his gaze to Stanford and smiled, his hands spread on the table.

‘So what am I to make of all this?’ he asked. ‘First, the Canadian government announces that they have abandoned their saucer project. Next, ten months later, the US Air Force officially announces that such a project is underway. Was it or wasn’t it?’

‘It was,’ Stanford said. ‘By February 1959 the press was receiving ambiguous Air Force statements about a revolutionary new aircraft that had been undertaken jointly by the US Air Force, the US Army and the Canadian government. Then, on April 14, during a press conference in Washington, DC, General Frank Britten implied that the first test flight of the aircraft was imminent and that it was destined to revolutionize traditional aeronautical concepts.’

‘That doesn’t necessarily imply a saucer.’

‘It did,’ Stanford said. ‘In August, 1960, the Air Force, giving in under pressure, allowed reporters to view the very machine they had all been writing about. What the reporters were shown was the Avro Car, an experimental aircraft that combined the characteristics of air-cushion machines and airplanes – in short, a crude flying saucer based on the principles of the jet ring and barely able to rise above the runway. Small wonder, seeing this, that they experienced no surprise when, in December the following year, the Department of Defense announced that they were withdrawing from participation in the project.’

Stanford finished off his bacon cheeseburger, wiped his lips with a paper napkin, then sat back and stared intently at Epstein, not smiling at all.

‘There the story of the *official* flying saucers ended,’ he said. ‘Scaduto spent months trying to work out what it all meant, but in the end he grew increasingly baffled. First, he tried to find a correlation between the fact that an awful lot of UFOs seemed to come from and return to Canada and the fact that the Canadian government had been engaged in trying to build flying saucers – but there could be no remote comparison between the capabilities of the unknowns and the pathetic performance of the government-sponsored saucers. On the other hand, there were a few lingering mysteries…’

‘Let me try to guess,’ Epstein said. ‘Why did the Canadian government announce that they had dropped their flying saucer project when in fact, at least according to the US Air Force, they were still working on it? And why did the US Air Force Secretary announce that aircraft like flying saucers would soon be flying? And why, after that announcement, was there a four-year gap – with no sign of the magical aircraft – before a remarkably similar announcement was made? And why, after this latest announcement, did the Air Force unveil their magical offering, let it be known that it was a failure, and then announce that they were dropping the project? And finally, why, if the Canadians had genuinely dropped their flying saucer project, did the US

Department of Defense, in announcing the termination of their own project, state that they were *withdrawing* from *participation* in the project? Withdrawing from participation with *whom*?'

'Those were the burning questions,' Stanford said. 'The suspicion remained that the Canadian government and the US Air Force were both still involved in the construction of flying saucers, that those saucers were vastly more advanced than the rubbish the Air Force had deigned to show us, that some of the supposed UFO landings on or around various top-secret military establishments were actually the products of Canadian-US cooperation, and that the Canadian and American statements, with their contradictions and ambiguities, had been designed to deliberately confuse the facts and turn them into rumors.'

'Good God,' Epstein said.

Stanford didn't smile at all. He paid the check and stood up. Epstein followed him out into the street and turned his fur collar up. Neon lights flickered spasmodically. The snow was turning to slush. The street was crowded with beaded youngsters and politicians and whores, with well dressed secretaries and generals wearing suits, all defying the biting cold. Stanford headed for M Street. Epstein coughed at his side. They both walked in a deliberately casual manner, rarely looking around them.

'Anyway,' Stanford said eventually, 'unable to solve the mystery, Scaduto finally had to let it go. Then, in 1965, it all came back with a bang.' Glancing up at the sky, scarcely aware that he was doing so, he saw a patch of glittering stars above the clouds, the black void all around them. 'In 1964, 1965 and 1966 there were three singular events that really put the Air Force in a fix. It was the culmination of those events that finally stung the Air Force into getting rid of its much publicized Project Blue Book – and that also encouraged Scaduto into re-examining the whole Canadian mystery. The first of these events was the close encounter of the third kind of Socorro, New Mexico, in 1964, when Deputy Marshall Lonnie Zamora claimed to have

seen two schoolboy-sized people in coveralls standing beside an egg-shaped, metallic craft that was resting on legs extending from its body. The machine took off with a roar, spitting flames and ascending vertically, before Zamora could get down there to investigate.'

'An extraordinary case,' Epstein said. 'Witnesses, including Allen Hynek, later confirmed that the four landing marks and the burned greasewood plants, a local verified that he had seen Zamora's squad car heading toward a strange, oval-shaped object that was descending in the direction of the sighting, and a check with NASA, the Jet Propulsion Laboratory, and fifteen industrial firms to see if they were working with experimental lunar landing modules in the area received nothing but negative replies. Hynek later described the incident as one of the major UFO sightings of all time.'

'Jesus,' Stanford said, 'your photographic memory's better than mine… Anyway, that was the first event. The second was when, on March 20, 1966, at Hillsdale College, Hillsdale, Michigan, *eighty-seven* female students and a civil defense instructor saw a glowing, football-shaped object hovering over an empty swamp a few hundred yards from the women's dormitory, repeatedly racing at and retreating from the dormitory, dodging an airport beacon light, and generally flying back and forth for hours before disappearing – and when, the next day, in Dexter, Michigan, five people including two police officers reporting seeing the same. The third event was merely the widely reported fact that by 1966 a Gallup poll had indicated that approximately *nine million* Americans thought they had seen a UFO. It was these major events, plus the Great Northeast Blackout of November 9, 1965, that led directly to the infamous Condon Report and the final closing down of Project Blue Book. Now while the Great Northeast Blackout was actually the second incident, I've left it to the last because it was the incident that really resurrected the Canadian mystery at the NICAP – particularly with Scaduto.'

Stanford saw Epstein swallowing another tablet while passing the numerous pedestrians on the sidewalk as if they didn't exist. His old friend looked

exhausted and very ill, which made Stanford feel both helpless and angry.

‘As you already know,’ he said, ‘there’s a long history of UFOs being seen over power lines and of subsequent, unexplainable power failures. Now, during the first week of August, 1965, thousands of people in Texas, Oklahoma, Kansas, Nebraska, Colorado and neighbouring states witnessed one of the biggest UFO displays ever. Unidentified lights flew across the skies in formation, were tracked on radar, and played tag with civilian and Air Force aircraft. This major display of UFOs eventually faded away, but a milder flap continued over the next three months until, on the night of November 9, unidentifieds were reported from Niagara, Syracuse and Manhattan. Then, the same night, all the lights went out – in Connecticut, Massachusetts, Maine, New Hampshire, New Jersey, New York, Pennsylvania, Vermont and a section of Canada – went out over a total area of eighty thousand square miles and a population of twenty-six million people.’

‘I remember it,’ Epstein said. ‘The huge power grid that controlled all those blacked-out areas – an interlocking network linking almost thirty utility companies, with hundreds of automatic controls and safety devices – was considered to be invulnerable… yet the cause of the blackout was never ascertained.’

‘Right,’ Stanford said. ‘They never found out what caused it. The only thing they knew for certain was that the failure had occurred somewhere in the flow between the Niagara Falls generators and the Clay power substation, an automatic control unit through which the electric power flowed from Niagara Falls to New York.’

‘There was a UFO connection,’ Epstein said.

‘Yes,’ Stanford said. ‘First report of an unidentified was made by the Deputy Aviation Commissioner of Syracuse, Robert C. Walsh, and several other witnesses, all of whom, just after the power failed at Syracuse, saw what

resembled a huge fireball *ascending* from a fairly low altitude near Hancock Airport. Approaching for a landing at that time was Flight Instructor Weldon Ross and his passenger, computer technician James Brooding, both of whom saw the same object, at first mistaking it for a burning building on the ground – something corroborating the fact that the fireball was at low altitude – then quickly realizing that it was something in the air: a single, round-shaped object about a hundred feet in diameter, which they later described as a flame-colored globe. And, according to Ross's calculations, that object was directly over the Clay power substation.'

'So,' Epstein said, 'we're back with Canada.'

'*Yes,*' Stanford said with some emphasis. 'For obvious reasons this whole damned mess resurrected the Canadian mystery at the NICAP, particularly with Scaduto. Now, more than ever, he was convinced that there was some sort of connection between Canada and the UFO phenomenon. He was convinced even more of this when a friend pointed out that until the United States defensive radar network was extended to the Far North, which was in 1952, Soviet long-range reconnaissance planes from Siberian and subarctic bases had flown frequently over Alaska, the Yukon territory, and the MacKenzie District areas to spy on what was supposed to be relatively uninhabited territory. This just didn't make sense. What the hell were the Soviets spying on? And so wondering about this, Scaduto pulled out his Canadian files and started working again.'

They crossed M Street, drawn forward by the traffic lights, turned left on the sidewalk and kept going, rarely looking at anything. Eventually they turned again. They both walked like blind men. The residential streets were empty and quiet, the snow gleaming in darkness.

'Scaduto found nothing new in the files,' Stanford said, 'but by accident he finally struck gold. One of the members of the NICAP board of governors had managed to run down one of the CIA agents who'd been transferred after the Woman from Maine affair. This agent, who'd been transferred to London,

England, before being eased out of the service, was naturally feeling embittered and was willing to talk as long as it was off the record. Consequently, Scaduto met him in a room in the Drake Hotel in New York, and what Scaduto was told knocked him out.'

Epstein shivered with cold, rubbed his eyes and coughed painfully, cursed softly, but kept listening to Stanford.

'Apparently,' Stanford said, 'one of the agent's assignments in the CIA was to undergo specialized training in Duke University's parapsychology lab, the psychology department at McGill University in Canada, and a sensory-deprivation establishment at Princetown. The purpose of all this was to open his mind – a naturally responsive one – to mental telepathy, sightless vision and psychokinesis. The reason for this, it was explained to him, was that the US was about thirty years behind the Soviets in this field, and that the Russians were already employing such skills for espionage purposes.

'After a year of training, the agent found that he could, like Ted Serios, cause photographs to appear on a film by merely focusing intently on the camera. A year after that, in 1959, he was working with US Naval Intelligence with the US *Nautilus*, the then renowned atomic submarine. And that same year, when the press exposed the *Nautilus* experiments, he was transferred back to Washington, DC, to work with the female psychic from Maine.

'During his first session, in the presence of the psychic, the agent wasn't able to make contact. However, at the second session, in the CIA office in DC, when the woman wasn't present, he went into a trance and made contact with *someone*. Now, like the woman from Maine the agent was scribbling down, automatically, what it was he was hearing in his trance. He never actually found out what he wrote… because by the time he woke up one of the senior officers present had spirited the message out of the office.'

'So they didn't want him to know who he was talking to.'

‘Correct,’ Stanford said. ‘No matter: when he finally woke up he found everyone at the window, all excitedly scanning the sky where the UFO, apparently, had been. Intrigued – and annoyed because his notes had been stolen from him – the agent later had a clandestine meeting with one of his colleagues and asked him if the UFO had been real. His colleague, pretty drunk at the time, told him that it was real, that it was part of a top-secret government project, and that one of the crew on board had been ESP trained. The woman from Maine had picked up his thoughts by accident.’

They were nearing Epstein’s house, the streets were empty and quiet, and Epstein kept his head down, breathing harshly, coughing too much, his head filled with what Stanford was telling him, his heart pounding excitedly.

‘That wasn’t all,’ Stanford said, speaking almost in a monotone, his gaze fixed on the street straight ahead, on the tall, brownstone buildings. ‘According to the agent’s colleague, the UFOs reported to have landed at Cannon AFB, Deerwood Nike Base, Blaine AFB and, apparently, Holloman AFB, actually existed. Those saucers were the products of years of highly secret activity between the Canadian and United States governments – but in no way did they resemble the aborted projects that were leaked to the press. They were, in fact, highly advanced flying saucers of the most extraordinary capability – and there was a total of about twelve in existence.’

Now Epstein felt really excited. He ignored his aching stomach. He didn’t sense Stanford’s rage, had no thoughts of betrayal, felt nothing but an exalting vindication of all he had lived for. The UFOs existed. He had not pursued phantoms. He could die without dwelling on failure, and that made it all worth it.

‘Only twelve?’ he asked instinctively, still a researcher first and foremost, needing every detail to hand.

‘Yes,’ Stanford said. ‘According to the agent, his colleague had previously been seconded to the Royal Canadian Air Force Intelligence where he was

given the task of implementing internal security on the flying saucer project. This project, he soon discovered, had been in existence since 1946, and was being run jointly by the Canadian government, the US Air Force and Navy, and a few high-ranking officers from the Pentagon. They had managed to maintain secrecy by locating the underground productions plants in the vast, deserted regions of southern Canada between British Columbia and Alberta; by ensuring that production of the numerous components for the saucers was distributed between hundreds of different, international companies, none of whom could have guessed what they were for; by undertaking the more specialized research in the super-secret installations of the White Sands Proving Ground and similar establishments all over Canada; and, finally, by deliberately confusing the media and public with a continuous stream of ambiguous leaks and misleading statements. In other words: those saucers are real and they're hidden in Canada.'

Epstein stopped at the street corner, turned around to stare at Stanford, looking up, his eyes bright in the lamplight, flecks of snow on the gray beard.

'You *do* realize,' he said, 'that this leaves a mere twelve saucers to account for all the sightings of the past thirty years?'

'Yes,' Stanford says, 'I realize that. But it's not what I'm saying.'

'Oh? And just what *are* you saying?'

Stanford didn't hesitate. 'It transpires that the Allied Air Forces had been harassed by UFOs – mostly in the shape of balls of fire – from as far back as 1944. Then, shortly after the war, in the summer of 1946, the more familiar types of UFOs, mostly cigar-shaped, swarmed across Scandinavia, seemingly coming from the direction of the Soviet Union. The conclusion at the Pentagon was that German scientists, seized by the Russians at Peenemünde where the V-2 rockets had been developed, were constructing advanced weapons for the Soviets, and that the unidentified, so-called *missiles*, were being launched from the rocket test site of Peenemünde, which was then in

the Russian-occupied zone of Germany. This suspicion became stronger when the British, who had also seized and taken back to Britain a wealth of Germany's top-secret scientific and weapons research material, announced that the Germans had been working since 1941 on extraordinary aeronautical projects and on processes to release atomic energy. Included in the former was a "remotely controlled, pilotless aircraft" and a "device that could be controlled at a considerable distance by another aircraft." So, faced with this, and thinking of the supposed Soviet *missiles* over Scandinavia, there was a sudden British-Canadian-United States alliance to beat the Soviets in the race to follow through the German designs and complete their remarkable aeronautical projects.'

They stood together at the corner, a cold wind beating at them. Stanford was totally humorless, his eyes unusually intense, and Epstein looked up at him in wonder, either dazed or still doubtful.

'Listen!' Stanford said. 'As we've just been discussing, the actual concept of a flying saucer is not a new one. The US Navy and the British Navy have both been interested for a long time in the possibility of constructing either a vertical rising aircraft or a simpler air-cushion machine that would be particularly suitable for use at sea. Regarding this, the Navy Flounder and the Flying Flapjack were crude examples of the former, the normal Hovercraft a perfect example of the latter. However, what they were attempting to build in the underground plants in Canada was a machine with the extraordinary capabilities of the ones suggested in the incomplete German research material. They wouldn't achieve this goal for another twenty years, but the first, extremely crude versions of their saucers were successfully tested over the Canadian border on June 21, 1947: a total of five disk-shaped aircraft, two of them piloted and approximately fifty feet in diameter, the remaining three remote-controlled by the pilots flying nearby, these three a mere six feet in diameter. These particular flying saucers could reach an altitude of approximately seven thousand feet, could hover uncertainly in the air, and had a horizontal speed of about six hundred miles an hour.'

‘That test flight,’ Epstein said, ‘could account for the Harold Dahl sighting of that same day.’

‘Right,’ Stanford said. ‘However, it was what happened *after* that test flight that really got the ball rolling. On June 24, three days after the first successful test flight of the five Canadian-US saucers, a total of nine, highly sophisticated, *unknown* saucers flew down over the Canadian underground plants, hovered there for about twenty minutes, shot off toward the Cascades where they reportedly circled the test area, then returned, circled the plant for another twenty minutes, then shot off at incredible speed. And from that day on – the day, incidentally, of the famous Kenneth Arnold sightings – those UFOs, and others, returned again and again, eventually spreading out across the whole world.’

Epstein stepped back and covered his mouth with a hand, his eyes too large and very bright, his body visibly shaking. Stanford watched him, saying nothing, waiting for him to recover, finally saw him removing his hand from his mouth and shaking his head in confusion.

‘My God,’ Epstein said, ‘are they Russian?’

‘No,’ Stanford said. ‘The agent’s colleague, during his tenure at the flying saucer plant in Canada, never found out who those saucers belonged to. What he *did* find out was that some time during the Cold War the Pentagon received proof that the unknown saucers didn’t originate in Russia – and that the Russians had been harassed by the very same objects. He also found out that they were *not* from outer space, that the Pentagon probably knew where they came from, and that Canada and the United States were racing to build similar machines, because the unknown saucers, even as far back as the Fifties, had the sort of maneuvering capability that made them virtually invincible.’

Epstein turned around and walked away. Stanford followed him around the corner and saw him stopping again. He seemed to be frozen. He was staring

across at his own house. Three men in dark suits were coming out of the house and walking toward a black limousine. Epstein offered a strangled cry. The three men all looked up. Epstein started running across the road toward them, his heavy overcoat flapping. Stanford cursed and ran after him. The men slipped into the car. The car's headlights flashed on, forming a dazzling pool of light, and then the car roared and shot off down the street. Epstein stopped and stared at it. Stanford slid to a halt behind him. The car slowed down at the far end of the street, turned the corner and vanished.

Epstein cursed and lurched onward, almost slipping in the snow. He and Stanford reached the brownstone together and found the door open. They both hurried inside. The whole house had been ransacked. Epstein kept looking around him, his eyes dazed, uncomprehending, then he groaned and covered his face with his hands and dropped into a chair.

'Bastards!' Stanford hissed. 'They've got us marked!'

He reached down and grabbed Epstein, pulled him up to his feet, shook him until his hands fell from his face and his eyes were wide open. He held Epstein by his shoulders, trying to keep his old friend steady, then he spoke in a low and urgent voice that gave Epstein his strength back.

'Listen to me,' Stanford said. 'I didn't stop at Scaduto. I conducted some investigations of my own and this is what I discovered.'

'I discovered that the mysterious fireballs seen frequently over Nazi Germany disappeared for good when the Second World War ended. I discovered that the Russians, the British and the Americans divided the scientific spoils of Germany between them, and that some of those spoils were rumored to be related to the German fireballs. I also discovered that the British had received the major portion of this scientific booty, and that they had, in 1945, sent back secret German aeronautical equipment and papers to be distributed to their experimental research centers in Australia and Canada.

‘I discovered that by 1947 certain British aeronautical establishments were experimenting with such bizarre Germany concepts as a supersonic flying wing, a gyroscopically stabilized pilot’s cabin surrounded by a revolving turbine engine, and a suction airfoil shaped like a meniscus lens – or like a fucking great mushroom. And finally, I discovered that in 1946, with the encouragement of the British government, there had been a mass migration of aeronautical establishments and their workers from their original English production centers to the vast, uninhabited regions of southwest Canada.’

‘So,’ Epstein said. ‘*What does it mean*?’

‘What I believe,’ Stanford said, ‘is that the Canadian and American governments, quietly backed by the British, have been working jointly since the end of the Second World War on the development of supersonic flying saucers, that they now have a limited number of such machines hidden away in the wilds of Canada or in the White Sands Proving Ground, and that those saucers are based on aeronautical projects that originated in Nazi Germany, but aren’t related to the vast majority of UFO sightings. What I also believe is that the US government knows the origin of the more extraordinary saucers, that it’s frightened of what the capability of those saucers might represent in military and political terms, and that its building of its own saucers is a race against time and its secrecy a means of avoiding national panic. Finally, what I believe is that the government has to keep its secret, that it will murder to do so, and that the deaths of Jessup and Hardy, of Dr McDonald and Irving Jacobs, are examples of how far the government will go to keep the lid on the pan.

‘The Canadian government has flying saucers. The US government has flying saucers. But someone, *somewhere*, has flying saucers so advanced we can’t touch them. Those saucers don’t come from space. They aren’t figments of imagination. They are real and they are right here on Earth and their source is a mystery.’

Epstein pushed himself away, spinning around, bumping into a chair, then he

hurried across the wrecked room, past his pillaged belongings, and jerked the curtains away from the windows to look up at the stars. He stood there a long time, didn't once rub his beard, and when he finally turned back to face the room, his eyes were glazed with an intense, haunted brilliance.

'I'm going to Paris,' he said.

CHAPTER TWENTY-FOUR

I owe Kammler and Nebe. Without them, I would not be here. That I killed them was not a sign of malice but of simple expediency. I think of it often. What I did, I had to do. The deaths of Kammler and Nebe were necessary for the good of the colony. They were both becoming greedy. They wanted power for themselves. They were more concerned with politics than science, and I knew what that meant. Plots and counterplots. The introduction of intrigue. A dissension that would interfere with work and thus hinder our progress. Such a possibility could not be tolerated. We had come too far for that. For that reason I had them gassed as they slept, then I took over the colony.

Yet I recognize my debt. Without them, I would not be here. I never liked them, but they did what was required and made good our escape. We left Germany behind us. We embraced the world of ice. Beneath the ice, in the immense, towering caves, thousands slaved to support us. The colony grew quickly. Without dissension there was progress. Our medical and scientific experiments led to wondrous achievements.

I was racing against time. I was sixty-six years old. What I did in the laboratories in the ice was a necessary evil. What I did, I had to do. If I died before my work was completed, the colony would flounder. I had to make it self-sustaining. The workers had to be controlled. Sooner or later, even the guards with the whips would have negative thoughts. This could not be allowed to happen. The control had to be automatic. I was obsessed with the mysteries of the brain and biological mutation.

What I did, I had to do. The slaves writhed beneath my knife. The gray matter

of their brains was explored; lungs and hearts were examined. Their blood was my life's blood. What they suffered was necessary. Vivisection on animals is useful, but has grave limitations. So, I operated. The experiments were not pleasant. Many died and many more became crippled and had to be terminated. Nonetheless, I progressed quickly. Without law there are no boundaries. The mystery of human life was unraveled as it writhed on the tables.

I was aging every day. I felt the fluttering of my heart. My skin was tightening across the cheekbones of my face and my stomach was addled. This frustration was energizing. I spent months in the laboratories. The experiments in the camps of Nazi Germany now bore splendid fruit. Hearts and lungs were transplanted. Prosthetic arms and legs flourished. Many died on the tables, those maimed were terminated, but our gains soon overcame the cost and encouraged us further. Gerontology was a priority. My own aging was the spur. We experimented with various drugs and surgical aids and had dramatic results. Naturally we made mistakes. There was paralysis, palsied limbs. Nevertheless, with application and will, we eventually met with success. At first it was modest. Vitamin pills and various stimulants. They, however, were just a beginning and soon led to much better things. I myself was thus saved. The first injections renewed my vigor. Within a year, with my heart at full strength, I could receive the pacemaker. A tentative first step. The artificial stomach followed. Years later would bring the plastic surgery and the minor prosthetics.

The means of control were urgent. This goal obsessed me next. I was aware that even the most fanatical guards would eventually yearn for the outer world. Human nature is a curse. It is weak and quite irrational. What I wanted was a method of control that would make the guards obsolete.

I exposed the human brain. Once exposed, it is a blancmange. No mystery: just tissue and fibers, blood and acid and water. I experimented with the brain. I specialized in living subjects. I discovered that by tampering with

certain cerebral areas, the mental processes of the brain could be altered in any manner required. I inserted microscopic electrodes. I had them activated by computer. Thus, at the press of a button, I could introduce pain or pleasure, craven fear or brute aggression, numb acceptance or insatiable curiosity, heightened intelligence or idiocy. This discovery was invaluable. It was promptly utilized. Within months, implantation of the workers was well underway.

We were masters and slaves. The latter were virtually robotized. The former were still controlled by Artur Nebe, but were clearly redundant. The slaves had all been implanted. The whips were no longer needed. The only danger of revolt now resided in the guards and technicians. Nebe recognized this danger. He gave permission to implant. We both knew that this could lead to resistance, so we had to work carefully. It took us two years. We performed the implants one by one. We anesthetized the men while they were sleeping and then stole them away. The operation was simple. The men were programmed to forget the implants. When they awakened, they would not seem any different to those still untouched. After two years it was finished. There were no untouched left. Only Kammler and Nebe and myself were allowed to go free.

Every member had his function. His every thought was controlled. Every man, woman and child was robotized and had his course mapped out for him. Their desires were my desires. Their needs were my needs. I ordained their pain and pleasure, their every hunger, and was worshipped accordingly.

The implantations were all different. Some severe, some less so. What mattered was that each individual would perform as required. To drain a mind is to kill it. One must drain only a little. One must leave free those cerebral areas that perform certain functions.

The technical staff were least affected. I left them the spur of discontentment. This discontentment only related to their creative urge and did not go beyond that. What I removed was their hostility. What I enhanced was their love for

work. Given this, they were almost like normal men, but lacked personal ambition.

Below the technical staff were the administrators. Such men and women were more affected. Required for systematic tasks, uncreative and repetitious, they were programmed to be wholly positive thinkers, enthusiastic and dedicated. They were drained of discontentment. Their work triggered satisfaction. In frequent contact with the scientists, who were almost like normal men, the administrators had minimal personality and no thought for themselves.

The lowliest workers were most affected. I could allow them no personality. I think of Nebe's soldiers, of the factory workers and secretaries, of the drivers and laborers and cooks who performed simple tasks. All were heavily implanted. All were drained of personality. All were programmed to perform their given tasks without reason or thought. In a real sense they were robots. They experienced few emotions. Much cheaper and more reliable than cyborgs, they had a minimal consciousness.

What an achievement this was! The first perfect society! No waste, no crime, no need for debate, no insubordination or rebellion, no conflict of any kind. Such a society is a miracle. It is also highly productive. With no digressions for politics or conflict, it can advance by extraordinary leaps. It can and ours did. We rode the whirlwind and conquered it. Within two years our saucers were creations of an awesome complexity. Jet propulsion was obsolete. Atomic energy was routine. And even this, given the benefit of hindsight, was but a modest beginning.

I see the saucers as I sit here. They soar vertically from the wilderness. As I observe them, they glide across the sky and cast their shadows on mountain peaks. The sun beats all around them. They merge with the flashing ice. They ascend vertically and the hover in silence, their inertial shields glowing.

I confess: I feel pride. Inhuman? I cannot be. As I sit here on the mountain, as I gaze out through the windows, the beauty of the saucers above the snow

makes me feel like a young man.

A divided society could not have accomplished it. Certainly not in that brief period. I would not have accomplished it myself had I ignored Nebe and Kammler.

They both wanted to leave the wilderness. They wanted to regain what they had lost. Simple men, moved by normal, pointless hungers, they wanted cheap, instant glory. The saucers offered that opportunity. They knew the saucers were invincible. They wanted to use the saucers to plunder the Earth and make it bow down before them.

I did not desire the same. I wanted only my work. My new cathedrals were made of ice and stone, my sole religion was science. I did not want that changed. I knew that conflict would change it. I also knew that with patience and time there would be no need for conflict.

The saucers rendered us inviolable. Their very existence was our security. What we needed, we could obtain from the outer world if we handled it properly. Meanwhile, we could progress. We could increase our capabilities. If we did so, we would be in a position to gain much with no effort. The outer world would have to join us. We would gradually draw it in. Given time, the outer world would surrender, turning men into Man.

Yes, given time. But Nebe and Kammler had no time. Their brains untouched by the healing electrodes, they were still normal men. They still suffered from base emotions. They felt fear and resentment. They both yearned for the world beyond the ice, and for its decadent pleasures. Vengeance and power. Material gain and the means of squandering it. Like bored children, Nebe and Kammler were inflamed with the need for attention. No, they couldn't wait. They wanted a war of their own making. They wanted to use my remarkable creations as their weapons of plunder.

I could not let that happen. Such a victory would be short-lived. Such

aggression would be met with the resistance of inane politicians. Why encourage a nuclear war? What real purpose would it serve? Already our resources were running low, our needs increasing dramatically. What we needed, the world possessed. We could have it without conflict. In gaining it, we could progress even more and thus bide our own time. In the end, the rest would come. The rule of science was inevitable. A conflict such as Nebe and Kammler wanted could only lead to mutual destruction. I could not let it happen. I had no immediate goals. My concern was for the future of science and Man's metamorphosis – I still wanted the Superman.

My intention was to trade. I needed mass-produced items: small components and tools, nuts and bolts, screws and nails, light bulbs and printing paper and pens and other modest essentials. So far we had stolen them. Our flying saucers had landed. We had often abducted human beings and machines where isolation protected us. But nuts and bolts were more difficult. Small items were large problems. What was shipped to here throughout the war years was now diminishing rapidly. No colony can be self-sustaining. I had always understood this. So it was that in 1952 I had to form an alliance. There was really no alternative. I had no choice but to trade. What I had, the world needed; what the world had, I needed; and until I had the world on my side, I would have to negotiate.

Indeed, I had already started. I was negotiating with President Truman. After the Washington invasion of 1952, he had agreed to a meeting. We met in the Oval Room. My CIA contacts were present. President Truman was an intelligent man, and as such he was nervous. He kept fiddling with his glasses. His lower lip was not too steady. General Vandenberg was standing near the desk, his eyes bright with suppressed rage. The Oval Room was crowded. General Samford and Professor Robertson. Other members of the Robertson Panel, including Lloyd Berkner. The meeting didn't take long. They had already examined my brief. Most being specialists in the physical sciences, they had no problem in reading. I put forward my proposals. Truman sighed and raised his hands. Generals Vandenberg and Samford

were outraged, but inevitably out-voted. The scientists knew what they were reading. They were aware of our capabilities. They put the facts bluntly to Truman and we reached an agreement.

After that, I had no choice. Nebe and Kammler became a threat. Disgusted that I should barter instead of conquer, they started plotting against me. I have no proof of this. I just know it was inevitable. Their chance for immediate recognition and power had been ruined by my actions. They were now trapped in the colony. In the outer world they would be war criminals. The only way they could return to the outer world would be to land as aggressors. So, they felt trapped. Thus they had to plot against me. And knowing this, I had no choice but to remove them and take over the colony.

They had not been implanted. They were men of free will. I could not, as I could with the others, suggest euthanasia. For this reason I had no choice. What I did, I had to do. I could not concern myself with individuals while my future was threatened.

Not shortly after the war, then. It was 1953. We had dinner overlooking the plateau, the snow white, the stars glittering. I served champagne and caviar. The meal was followed with brandy. Such luxuries were rare in the colony, but the night seemed to warrant it. Kammler spoke of America. He reminisced about his visits there. Artur Nebe turned his glass between his fingers, his dark eyes unrevealing. Kammler spoke of General Vandenberg. His voice trembled with loss. He said that Vandenberg had reminded him of his past, of his days with the military. Artur Nebe was not attentive. His gelid eyes surveyed the ice. He gazed over the glistening plateau to the dark, frozen wilderness. Kammler spoke of the V-2 rockets. He talked of fighting in the Hague. He recalled his days with Walter Dornberger and Wernher von Braun. The hours passed in this manner. Artur Nebe's cold eyes were veiled. A large saucer became a glowing cathedral that ascended majestically. Artur Nebe did not look up. His gaze was fixed on the wilderness. Kammler yawned and stood against the large window and was framed by the starlit night. He

talked vaguely about the future. He said decisions must be made. He turned away and I saw the white wilderness dissolving in darkness.

They both left shortly after. I had no sense of urgency. The glowing cathedral descended from the heavens, hovered briefly and disappeared. I looked out and saw the ice. The frozen wilderness stretched out below me. I stood up and then went to my desk and turned on the two scanners. Kammler and Nebe were in their rooms, the latter with his whore. I reached down and pressed the button on my left and let the gas fill their lungs.

What I did, I had to do. What I do, I have to do. Above morality, above the sanctity of the individual, is my duty to science. I do not suffer guilt. They were of use and were used. Without them, I would never have escaped – thus I offer them tribute.

CHAPTER TWENTY-FIVE

Stanford climbed out of the car, closed the door and looked around him, listening to the moaning of the wind as it swept across the broad field. The sun was going down, the sky aflame with crimson light, a few drifting clouds casting the shadows that would soon die in darkness. Stanford stood there for some time. The field was utterly desolate. The flood-lights and the barbed wire had gone, but the scorched earth remained. Nothing would grow here anymore. The butchered cattle had been buried. The dust drifted lazily across the ground, emphasizing the barrenness.

Standing there alone, Stanford was drawn to the mountains beyond the flatlands. He thought of what Scaduto had told him, and it made him feel lost. The saucers didn't come from space. They weren't figments of imagination. They were real and they were right here on Earth and their source was a mystery. Stanford thought about that. To think about it was frightening. He took in the desolate flatlands, saw the bloody sinking sun, watched the dust drifting over the field and then turned back to his car.

He sat in the driver's seat, closed the door and stared ahead, thinking of the girl on the ranch and wondered what she might know. Lust grabbed him immediately, filled his head with her presence, almost making him forget what he was here for, his groin flooding with heat. Damn it, he thought, starting the car, driving off, remembering her eyes, their oddly vacant luminosity, her breasts and her thighs and her brown legs, her thumb parting her moist lips. He couldn't understand himself, didn't know what was happening to him, so drove blindly, hardly seeing the road ahead, the flatlands stretching out on both sides. What was he really doing here? Was it

the girl or what she knew? Stanford shook his head wearily, feeling nervous and excited, confused by his conflicting emotions, despising himself.

The surrounding land was desolate. The crimson sky was turning dark. Stanford drove through pools of moonlight and shadow, over stones and potholes. He thought briefly of Professor Epstein, his good friend, growing frail, now obsessed because death was at his door and the mystery that had haunted him for years still remained unsolved. He had to learn the truth for Epstein. He didn't want to fail his friend. He couldn't bear to think of Epstein fading away, his eyes tormented by failure.

Yet that wasn't the only reason. In truth, it never had been. Stanford's throbbing groin insisted on the truth and stripped the mask from his self-deceit. He was doing this for himself, his own need was his main concern, and as he drove toward the ranch he felt shame, seeing only the girl.

He also felt a little crazy. He didn't feel like himself at all. His thoughts tumbled on top of one another and amounted to nothing. He was obsessed with the girl. His lust went beyond mere sex. He had to touch her, had to break through her silence, had to bore through her tunneled eyes. This need was bewildering, an irrational, compulsive lust; it was a need for the revelations of her body, for the source of her being. What she was, was what he needed. She belonged to what she had witnessed. The was alien, a human touched by the unknown, and that made her seductive.

It was that… and much more. She had known he would come back. She had known and told him so with her smile, with her luminous, empty eyes. Not empty: concealing. Eyes that shone and quickly darkened. She had looked at him and willed him to return and now he felt enslaved by her.

Stanford didn't know what was happening, and was powerless to resist. He felt as if the girl had hypnotized him and drained him of willpower. She had known he would come back. He had known it as well. They had both made the pact three years ago without saying a word.

Inexplicable. Ridiculous. It couldn't be true, yet it was real: a web of mysteries and intriguing possibilities with the girl at its center. Her vacant eyes, suggesting all. Her languorous innocence, inviting lust. Standing thought of her standing on the porch, gazing up at the sky. She had touched and been touched. She had observed and now knew. She was silent as only the knowing are silent: secretive and inviolate. Stanford wondered what she had seen. He wondered what they had done to her. And he wondered, with a strange, hallowed awe, what she had then done to him.

He drove for another five minutes, driving blindly and dangerously, bouncing over potholes and mounds of soil until he arrived at the ranch. He slowed down when he reached the gate, stopped the car, hesitated, then opened the door and slipped out and heard the wind's lonesome moaning. The ranch hadn't changed, was still sadly dilapidated, the dust drifting forlornly along the porch, the lights burning inside. The girl was not on the porch. There was no sign of the old man. Stanford sighed and then opened the gate and closed it quietly behind him.

It was now nearly dark. The wind moaned across the flatlands. Stanford walked very slowly toward the ranch, his eyes drawn to the windows. The lights were on inside. There was no other sign of life. The only sound was the moaning of the wind, and that made him feel nervous. Eventually he reached the porch, looked up at the nearest window. He saw an oil lamp glowing fitfully between the curtains, a shelf of cracked plates and cups. Stanford glanced up at the sky. The moon glided beneath the stars. Stanford shivered and then went up the steps until he stood on the porch. There was no sound from inside. Stanford felt very strange. He stepped forward and knocked on the front door and then stepped back again.

There was no immediate response. Nothing. Stanford waited for some time. Nothing happened, so he knocked on the door again and then stepped back a little. Silence. The wind. Stanford felt a bit unreal. He stepped forward and knocked on the door again and felt his heart racing uncomfortably. That

annoyed him a lot: he wasn't used to being nervous. He cursed softly and willed her to come and then he heard a faint sound. A tin mug on a tin plate. A chair scraping on the floor. Stanford took a deep breath and let it out and kept his eyes on the door. The bolt made a rasping sound. The door creaked and then opened slightly. A beam of light fell out over Stanford and then he saw the girl's face.

She stared blankly at him. Her brown eyes were too large. Stanford looked into those eyes and saw the void that led into the unknown. The girl was sucking her thumb. Stanford thought she was smiling. Her long hair tumbled loosely around her face in a dark, uncombed tangle.

'Emmylou?' Stanford said.

The girl nodded dumbly.

'Do you remember me?' Stanford said. 'I was here a few years ago. The night all the other men were here… the night the cattle were butchered.'

The girl sucked her thumb silently. The door was barely open. The girl's body was pressed against the door, her head tilted around it. She was wearing a cheap cotton dress. Stanford saw a brown leg. The girl stared at him, possibly smiling, then she nodded again.

'Can I come in?' Stanford asked. 'It's important that I talk to you. I want to talk to you and your father. Can you tell him I'm here?'

The girl just stared at him, her thumb still in her mouth, the brown eyes too large, strangely depthless, luring him in.

'Can I speak to your father?' Stanford asked. 'Is your father in there?'

The girl suddenly giggled, a high-pitched, childish sound, then she removed her thumb from her mouth and opened the door a bit wider. Stanford stared at her. He couldn't take his eyes off her. She was wearing the same flimsy dress

that she had worn three years ago, the buttons undone up to her thighs, undone down to her breasts. Stanford wanted to put it into her. He imagined himself doing it. The lust seized him with immediate, startling force and stripped his senses bare. He shook his head to clear it. He was sweating and felt feverish. The girl was leaning in a languid fashion against the door, a distant smile on her face.

‘Is your father in?’ Stanford asked.

The girl tilted her head slightly. Her eyes were focused upon him, very large, their brown depths oddly luminous. Then she giggled again. Stanford shivered a little. She stopped giggling and shook her head from side to side in a negative gesture.

‘He’s not in?’ Stanford asked.

The girl shook her head again. Stanford saw her belly pressed against the door, one breast thrusting around it.

‘You mean he’s not here?’ Stanford asked.

The girl nodded that this was so.

‘Where is he?’ Stanford asked. ‘Do you understand? I want to know where he’s gone.’

The girl opened the door wider, slipped around it like a dancer, moving with a natural sensuality that made Stanford harden. He saw the curve of her breasts, the faint outline of her nipples, glanced down and saw a brown inner thigh, a film of dust on her bare feet. The girl pressed against the door, slid along it, moved toward him, then she passed him, brushing lightly against him, and stood out on the porch. Stanford watched her, fascinated, seeing the curvature of her spine. She leaned back and then raised her left hand and pointed up at the night sky.

Stanford suddenly turned cold. He raised his head and looked up. The sky was dark and the stars were extremely bright, the moon gliding beneath them. What did she mean? Stanford couldn't work it out. He shivered and then stepped up to the girl until he stood just beside her. She was still pointing at the sky. She turned her head to stare at him. She was smiling, a distant, disturbing smile, her brown eyes hypnotizing him.

'What do you mean?' Stanford asked. 'You mean your father's up there? In heaven? You mean that your father has died and now he's up there, in heaven?'

The girl smiled and then giggled, shook her head from side to side, indicating that Stanford was wrong, still pointing up at the sky. Stanford wished she would talk to him. He was convinced that she could talk. Staring at her, he wondered if she was mad, though that somehow seemed doubtful. The girl returned his stare. Her hand was still raised in the air. The wind was pressing the cotton dress against her body, emphasizing her breasts and hips. Stanford glanced at the sky again, seeing only the moon and stars. He looked back at the girl and she nodded and kept pointing upward.

'He's not dead?' Stanford asked.

The girl giggled and shook her head from side to side.

'He's up there?' Stanford asked. 'He's in the sky? Someone took him away?'

The girl nodded in confirmation, then dropped her hand and turned toward him. The wind blew the dress behind her legs, leaving them bare. Stanford wanted to put it into her. He wanted no more than that. It was a mindless, brutally primitive desire, and he ached with his need for her.

'Who took him away?' he asked. 'Was it the men who were here that night? Was it the Army or the Air Force or the police? Who took him away?'

The girl raised both her hands, placed them together above her head, drew

them apart and lowered them gently to describe something dome-shaped. Stanford shivered, feeling cold. He also felt a distinct excitement. He nodded to show that he understood, then the girl raised her hands again. She pointed to the sky. Her left hand was mushroom-shaped. She let the hand drop in a vertical line, then knelt down and placed the hand on the porch and swept it up toward the sky again. It was an eloquent gesture, graceful, dreamlike, and then she turned around on her bare feet and slowly stood straight again.

‘They came back,’ Stanford said. ‘They came down in the strange aircraft. Your father was taken into the aircraft and then they all flew away.’

The girl nodded and smiled, put her thumb in her mouth, brushed past him and went back to the house and leaned against the doorframe. Her long legs were crossed. The dress flapped around her hips. Stanford saw the shadowed area between her thighs, raised his eyes, saw her steady, oddly luminous gaze. She was sucking her thumb, a child, perhaps insane, and Stanford flushed with a mixture of shame and primitive lust.

‘How long ago?’ he asked.

The girl’s brown eyes widened.

‘When did all this happen?’ Stanford asked. ‘How many days? How many weeks ago?’

The girl raised two fingers in a V sign.

‘Two days? Stanford said.

The girl nodded, then giggled and turned away and vanished into the house.

Stanford followed her in, feeling strange, not himself, intrigued by what she had told him and by what it might mean. The house was unchanged, the oil lamps still near the windows, casting shadows on the dusty wooden floor and the makeshift furniture. The girl stood near the table, smiling at him, sucking

her thumb; the shadows fell down flaking walls, crept over the old chairs, danced fitfully on and off the girl's face, the rise and fall of her breasts. Stanford returned her smile. There was light in her brown eyes. Her left-hand thumb was in her mouth and her right arm was folded behind her back. Stanford saw her parted thighs, seeing her flesh as his salvation. The shadows flickered on her face, a pool of light around her eyes; and the eyes, which were vacant, were also bright with some vague, sly awareness.

'Who were they?' Stanford asked. 'Who took your father away? Can you describe the men who took him away? What were they like?'

The girl tilted her head slightly, her knuckles pressing against her nose, her dark hair hanging down across her face and covering her right eye. Stanford thought she was smiling, but wasn't sure, just had that feeling; he then thought of what had happened, of the UFO descending, of the men taking her father away, and wondered how she could smile. An idiot? Possibly. Stanford wasn't too sure of that. There was a light in the brown, vacant eyes that gave hints of awareness. The girl seemed to be teasing him, her languid carnality seducing him; silent, she spoke through her body with a sly, feline eloquence.

'Who were they?' Stanford asked.

The girl giggled and walked up to him, stood very close to him, her breasts almost brushing his chest, the rising flesh lightly shadowed. She stared up at Stanford, still smiling, slightly mischievous, arched her spine and stood on tiptoe and raised her hand to his head. Stanford felt sick with longing. He had a hard, pulsating erection. The girl placed the edge of her hand against his forehead and drew it down to his chest. Stanford followed the hand down. He saw the cleft between her breasts. She moved her hand in a cutting motion across his chest, as if marking a line.

'They were all that size?' Stanford asked. 'They were small? Is that what you mean?'

The girl nodded and stepped away. Stanford moved into the shadow. His erection was tight against his pants and he wanted to hide it. The girl moved closer to him. She cupped her left hand in the air. She indicated that the men had been five feet tall, her eyes more expressive. Stanford nodded that he understood. The girl smiled and touched her forehead. She placed her hands around her neck, probably indicating a collar, then ran her delicate hands down her body in two parallel lines.

Stanford didn't understand. He was finding it hard to concentrate. The girl's hands were on her breasts, on her belly, on her thighs, pressing her own hollows and curves and increasing his lust. This wasn't what she intended. She was trying to tell him something. She waved her left hand in a negative gesure and then tried again.

Moving her hands down from her throat, drawing them away from one another, she rubbed them over the buttons on her dress as if trying to erase them. Stanford nodded that he understood. He saw the shivering of her breasts. The girl smiled and placed her hands on her shoulders and ran them straight down her sides. Her hands traced her gentle curves. She stooped down and ran her hands along her legs until they touched her bare feet.

'One-piece suits,' Stanford said. 'They were wearing one-piece suits. They were wearing some sort of coveralls and you didn't see buttons.'

The girl nodded and straightened up, a graceful movement, very sensual, the dress falling back over her legs, rippling over her breasts. She put her thumb back in her mouth. Stanford saw that she was smiling. She stared at him, her eyes more expressive, perhaps even inviting. Stanford looked her up and down. He couldn't take his eyes off her. He wanted to peel the dress from her body and press himself into her.

'Who were they?' he asked. 'I need to know where they came from. You know and I believe you can talk and I want you to tell me.'

Stanford studied her, fascinated, his will destroyed by his erection, trying to gauge what her large eyes were concealing, the room dissolving around him. The girl looked like an adolescent, ragged, unkempt, her feet dirty, her legs burned brown by the sun. Stanford heard the moaning wind. He thought of the moon and stars. The girl stood there, beside the old table, her long legs slightly parted.

‘You won’t talk,’ Stanford said. ‘Did they order you not to talk? Did they do something? Why won’t you talk to me?’

The girl just smiled and sucked her thumb, then started humming a tune. Stanford watched her, mesmerized. He felt totally unreal. The oil lamp on the table burned fitfully, flickering over her face. The girl sucked her thumb and hummed. She rocked languidly to and fro. She was leaning against the table, her hip forming a graceful curve. Stanford wanted to press against her, wanted to feel her tender flesh; he felt dizzy and tense with throttled lust and hardly knew where he was.

‘Who were they?’ he asked.

The girl didn’t reply. Stanford stared at the thumb in her mouth, at her breasts, her curved hip. The shadows flickered across her face, across the tanned skin of her throat, across the cleft of her breasts, her rocking belly, the leg exposed by the open dress. Stanford felt choked with lust. He simply had to step up to her. He stood right in front of her, very close, almost touching, and looked down into her brown, expressive eyes, seeing himself in their dark depths.

‘Who were they?’ he repeated. ‘I know you can talk. I need to know where the men came from. I know you can tell me.’

Looking up, the girl smiled, her thumb still in her mouth, still humming, her body rocking to and fro, her warmth flowing around him. He reached out and placed his hand on her wrist and tugged her thumb from her mouth. She

licked her lips in response. Her hand dangled indecisively. She smiled and slid the hand beneath her dress and lightly scratched her right breast. Stanford felt that he was choking. He saw the hand beneath the dress. Her fingers moved up and down, scratching lightly, her palm pressed to the white skin. Stanford's heart started racing. His sole reality was his erection. He raised his hand and pressed it down on the cloth right above the girl's hand. He saw her tongue at her lips, his own reflection in her eyes, then he felt her fingers slipping away and his hand cupped her breast.

'Who were they?' he asked.

The girl offered no reply. She was still humming contentedly. Stanford felt the breast beneath the thin cotton, very soft, very warm. He pressed gently and felt the nipple. The girl continued humming contentedly. Stanford pulled the dress back and cupped her bare breast in his hand, his palm rubbing the nipple, sliding slowly, pressing down, trying to flatten it. The nipple hardened against his palm. He squeezed the warm, heavy breast. The girl hummed and rocked gently against him, her warmth saturating him.

The room seemed to be dissolving. Shadows flickered across the walls. Stanford looked down at the eyes looking up. Silence. A moaning wind. His own breathing was too harsh. He took the collar of her dress in both hands and pulled the dress off her shoulders. The girl stopped humming, bit her tongue and smiled at him. Stanford slid his hands along her smooth spine, felt her sweat, tugged her to him. The girl continued smiling. Her belly was pressed against his erection. She just hung there in his arms, bending backward, her hands loose by her sides.

Stanford looked at her bare shoulders, very smooth, white; he lowered his gaze to drink in her milky breasts, the dark nipples erect. He didn't kiss the girl's lips. Her smile was distant, enigmatic. He bent over and pulled her hard against his groin and pressed his lips to her right breast. The girl quivered a little. Stanford kissed her heavy breast. He put his lips around the nipple and sucked it, his tongue licking and stroking. The girl quivered and writhed

against him. He felt her hand on his head. She stroked the back of his neck and pulled him down, her breast filling his mouth.

Stanford didn't know where he was. He didn't stop to think about it. He saw lights ascending silently to the sky, blending in with the moon and stars. It was all one and the same. She had known it and belonged to it. Stanford wanted her, he wanted some answers, and she was key to the mystery. He felt the nipple between his lips, sucked and licked it like a child. Her burning groin was pressed against his erection, moving back and forth, teasing. Stanford pressed her sweaty spine. He slid his hands down to her buttocks. He removed his lips from her right breast, slid his tongue across her skin, then took the other nipple in his mouth and let it roll through his teeth. The girl gasped and writhed against him, both her hands at his neck. She ground her belly against his throbbing erection and pulled him closer.

Stanford pushed her against the table, jerked the dress down her arms; she moved her arms and let the dress fall to her waist, her body sweat-slicked and white. Stanford sucked her breasts and nipples, soaked his lips with her sweat. The girl gasped and placed her hands on his neck and sunk her nails in his skin. Stanford felt her ridged spine, slid his hands up to her shoulders. The girl groaned and fell back and pulled him down, her thighs opening out to him. Stanford knew that he was lost. He spiralled down through a void. The girl was bent back against the creaking table, and he glimpsed the oil lamp. Its light flickered in a darkness. Beyond the darkness there was nothing. The girl opened her thighs and clamped them tight around his hips, and Stanford pushed his erection against her belly, his hands gripping her buttocks. He didn't think of what he was doing: her writhing form was his whole being. He had lived with her memory for three years and now her touch stripped his senses. He squeezed her buttocks and pressed upon her, kissed her breasts and nipples, slid lower and put his tongue into her navel, his lips sucking the creamy skin. Flickering shadows and light. A moaning wind in the distance. The girl lay back on the table, her thighs clamped around his hips, and he saw the dress tangled around her waist as his tongue licked her belly.

‘Yes,’ Stanford groaned. ‘*Yes*!’

The girl reached up for his jacket, pulled it down around his arms, and he slipped his hands from under her naked spine to let the jacket fall off. The girl gasped and grabbed his shirt, her fingers tugging at the buttons, her legs coiling around him, her buttocks pressed against the table’s sharp edge, her groin thrusting up into him. Stanford glimpsed the burning lamp, flecks of light in brown eyes, the eyes wild and blind, the pink tongue at her lips, dark hair lying across her tanned face, beads of sweat on her forehead. He groaned and ripped his shirt off. Her hands slithered along his chest. He saw the smooth skin of her throat, the marble shoulders, the heavy breasts, very white, the nipples dark and stiff, the dress around the slim waist.

The girl writhed and grabbed his belt, undid the buttons on his pants. He saw her parted legs, the golden down of her inner thighs, her dress split above the crotch and falling away from a red patch of panties. He groaned and unzipped his pants, spread his fingers on her belly, very smooth, soft and warm, felt the mound of damp hair, closed his fingers and slid them under her panties as she groped in his pants. Stanford groaned and muttered something. The girl gasped and shook her head. Stanford slid his fingers through the mound of hair, curled them back, felt inside her. The girl gasped and thrust down, her thighs opening and closing, then she tore at his pants and jerked them open and took hold of his cock. He groaned and felt inside her, the moist warmth, the yielding lips, found her clitoris as she pulled his cock out, her fingers closing around it. Stanford felt her sliding fingers, lost himself, *became* her fingers, thrust himself into the soft glove of her hand, his fingers kneading her clitoris.

The oil lamp cast light on the table. Around the lamp there was only darkness. Stanford groaned and dissolved, flowing out into that darkness, becoming one with the darkness and the silence that was torn by her gasping. The girl pulled his foreskin back. Her fingers slid up and down him. He drained out of himself, flowed away and knew only her silky touch. Stanford

felt deep inside her. She was wet and warm in there. He jerked his fingers out and tore her panties off, the ripping sound jolting through him. The girl gasped and shook her head, rocking wildly from side to side, her thighs clamped around his hips, her fingers tight around his cock, around his hardness, trying to guide him into her, his tip rubbing her clitoris. Stanford groaned and shuddered violently, grasped her buttocks, squeezed and pulled; the girl pushed herself against him, opened for him, drank him in, became part of him.

'Yes!' Stanford hissed. '*Yes*!'

He sank down and brought her with him, his hands clutching her buttocks, kneeling low, letting her slip off the table, her thighs opening wider. Stanford grabbed her by the shoulders, pulled her down hard on his cock; the girl gasped and slipped her hands beneath his arms and then clawed at his ribs. Stanford pushed her shoulders back. Her spine was bent in a flowing line. Her breasts were pointing at the ceiling, her brown thighs locked around him, her legs bent back, her feet touching the floor, his cock still deep inside her. Stanford held her sweaty spine. His other hand caressed her breasts. He groaned and lowered her to the floor and then pressed down upon her. She shook her head from side to side, her eyes closed, her mouth open. Her dishevelled hair was coiled across her nose and lips, curled around her pink tongue. Stanford stretched out along her. She opened her thighs and writhed beneath him. She pulled her legs up, her knees level with his shoulders, then slid her hands across his buttocks and squeezed him, hoping to coax him in deeper. Stanford groaned and rolled his hips. He felt her melting around his cock. She was liquid and his cock dissolved within her and he felt himself burning. He spasmed and changed direction, moving from one side to the other. He thrust deeper inside her, touched her center, set her loose, and she gasped and banged her head on the floor and started shuddering under him.

'Oh, God!' she gasped. '*God*!'

The words exploded over Stanford, ricocheted, filled his head, jerking him

brutally back into himself and making him open his eyes. He saw the girl's bouncing head, her closed eyes, her open mouth, strands of dark hair lying across her strained face, beads of sweat on her forehead. Stanford stared at her, startled. He raised himself up on his hands. He saw the smooth line of her shoulders, the stretched tendons in her neck, thrusting breasts, nipples dark and erect, his own sweat on her belly. Stanford looked along her body, saw his own heaving groin, her thighs parted, his groining pumping up and down, his cock thrusting, withdrawing. He was shocked, but couldn't stop, felt a mounting excitement. He ceased moving and the girl's body shuddered and then pushed up into him.

'Who were they?' he asked. 'You can talk. You can tell me. You hear me? I want to know who they were.'

'No!' she cried. '*God*!'

Stanford held himself off her. He was propped up on his hands. He looked down at her sweat-slicked, writhing body and then trust deep inside her. The girl gasped and clenched her fists, banged the fists on the floor. Stanford flattened her breasts with his chest and grabbed her under the shoulders. He pulled her tighter to him. She groaned and thrust down. Starting to lose control, he slid his hands beneath her buttocks, along the underside of her thighs, then pushed her knees back toward her face and raised her hips and thrust deeply. Stanford's head started spinning. He thrust in and out in long, languid motions, his buttocks constricting. Stanford thrust even harder, heard the liquid sounds of sex, felt her heat, that jellied warmth around his cock, her spasms building and shaking him.

'*Who were they*?' he whispered.

Stanford worked himself up onto his knees and grabbed the girl by the hips. She was stretched out below him. He pulled her buttocks off the floor. He slid his hands along the soft down of her thighs and then pulled her tight to him. The girl gasped and shook in spasms. Her body flowed away from him.

She was twisting on the floor, rocking wildly, her legs over his shoulders Stanford pulled her even closer, thrust fiercely inside her. He saw the lights in the sky, the butchered cattle in the field, all the friends who had died or disappeared, the miraculous UFOs. He had to crack the mystery. The truth must have dominion. He grabbed the girl by the hips and pulled her closer, thrusting in to him limit. He touched her. She broke loose. Stanford pushed his hips forward. The girl cried out as the spasms whipped through her and tore her apart. She started coming, wave piled upon wave, her body writhing and shuddering.

'Oh, my God!' she cried. '*They were Germans*!'

The last word cut through Stanford, exploded, made his head spin, and he shuddered, they both shuddered together, while the room spun around him.

They let it go and rolled apart, lay on their backs, breathing heavily, separated by a pool of flickering light, both half hidden in shadow. Stanford stared up at the ceiling. The walls were spinning around him. He licked his lips and let the spasms pass away and then he looked at the girl. She was lying on her side. Her hair fell across her face. The upper portion of her body was white, but her legs were a dark brown. She lay just outside the light. Her eyes were hidden by her hair. She was breathing in deep, painful spasms, her breasts rising and falling. Stanford stared at her, speechless. He knew he had to ask her more. Then he felt a wave of hatred flowing toward him as the floor started shaking.

'*Jesus Christ*!' Stanford whispered.

The room roared and seemed to shake, the crockery rattling on the shelves, and Stanford felt a sudden fierce wave of heat and was blinded by white light. He thought he heard the girl screaming, blinked his eyes and saw stars, heard her screaming in a terrible manner and rolled over toward her. The floor was definitely shaking. Cups and saucers were breaking. The glass in the windows blew apart and flew all over the room. Then the roaring stopped

abruptly. The wave of heat passed away. Stanford opened his eyes and looked at the girl and saw her clutching her head. She was shaking her head from side to side. She wasn't screaming anymore. She took her hands from her head and stared at him and the hatred flowed out of her.

Stanford drew away from her. He didn't think – he just did it. Her brown eyes were extremely bright and intense, illuminated by hatred. The floor growled and then stopped shaking. The girl jumped to her feet. Stanford jumped up behind her as she grabbed at a kitchen knife, picked it up, turned around and started slashing the air with it. Stanford ducked and jumped back. 'Get out!' the girl shrieked. She rushed at him, the knife raised high and glittering, and swung it down toward his face. Stanford grabbed hold of her wrist. The girl hissed like a cat. The knife clattered to the floor and she clawed at him with her free hand, her nails raking down his right cheek and gouging lines in his face. Stanford felt the warm blood, felt the pain, a chilling fear; he slapped the girl with the back of his hand and pushed her onto the table. The girl hissed and grabbed the oil lamp. 'Get out of here!' she screamed. She threw the lamp and it flew past Stanford's head and crashed into the wall. A crackling roar, a wave of heat. The burning oil poured down the wall. Stanford cursed and swung his fist at the girl and knocked her into the wall. The flames raced across the floor. Stanford had to leap away. The girl hissed and then darted for the door, flung it open, rushed outside.

Stanford choked in the swirling smoke. The flames were racing along the walls. Stanford cursed and then escaped through the doorway and saw the stars in the sky. Then the darkness exploded, became a sheet of fierce white light, blotting out the sky and flatlands and temporarily blinding him. Stanford stopped and then staggered backward, put his arm across his eyes, moved his arm away and squinted through his fingers, trying to see through the dazzling light. He couldn't see, but he could hear. There was a steady, bass humming sound. Stanford heard it and felt it – it was drilling through his skull – and he reached up and clutched at his head and then stepped forward blindly.

He missed the steps and fell down, struck the ground with his right shoulder, heard it snapping and felt a sharp pain that made him cry out. He rolled onto his back, spitting dirt, looking up, saw the brilliant striations of white light and closed his eyes again. The ground shook beneath him. His head was tightening and hurting. The sound was drilling through his skull, making his muscles seize up, and he shuddered, his body out of control, and then dropped down through darkness.

A light bored through the darkness, spread out and filled his vision. He opened his eyes and looked up and saw the dazzling white light. This time he could look at it. He tried to rise, but couldn't move. He heard the roaring of flames and turned his head and saw the whole ranch house blazing. Then he heard a noise behind him. He turned his head in the opposite direction. He saw a fierce white haze with brighter lights inside it, the lights forming a lone line. Then he saw the silhouettes. They formed a semicircle around him. They moved closer and he saw the ragged girl, looking down at him, smiling. The girls eyes were large and vacant. She was sucking her thumb. One of the silhouettes moved over to Stanford and knelt down beside him.

The man was wearing a gray coverall that looked silvery in the bright light; his face was deathly pale and unnaturally smooth, smiling slightly, removed. Stanford couldn't see him clearly. The man appeared to be quite small. He moved his head and the shadows disappeared and Stanford saw him more clearly. He wasn't an adult. He was about fourteen years old. He reached out and touched the side of Stanford's neck and Stanford felt very calm.

'You shouldn't have come here,' the boy said, his voice deeper than it should have been. 'We don't know what to do about you, Dr Stanford, because you shouldn't be here. We know all about you. We're not pleased with what you're doing. We are computing but we don't know what to do, because you shouldn't be here. We'll have to leave you for now. We have received no instructions. We will leave you and then, when we are gone, you will be able to walk again. You shouldn't be here, Dr Stanford. We were not informed of

this. We will leave you because we have no instructions and we cannot compute you. Close your eyes, Dr Stanford. That's right, keep them closed. When we leave, you will open them again and be able to walk. Keep your eyes closed. *Auf Wiedersehen.'*

Stanford kept his eyes closed. He hardly knew he had closed them. There was silence and his head felt very light and he felt very calm. He heard the footsteps moving away. A film of dust fell on his face. He felt the earth beneath his back, extremely cold, eating through to his bones. Then he heard a bass humming sound. Something thumped the ground lightly. He heard shuffling, a hollow, metallic drumming, then the silence returned. Stanford lay there, not moving. He kept his eyes closed, feeling calm. He smelled smoke and heard the crackling of the flames that engulfed the ranch house. Then the ground started shaking. Stanford felt the vibrating noise. The vibrating noise grew stronger, seemed to fill his whole head, then it cut out, became a rhythmic humming that spread out just above him. The ground settled down again. Stanford lay there, feeling calm. The humming noise became fainter, climbed away and then cut out, leaving silence, the whispering of the dust, the wind's dull, lonesome moaning.

Stanford opened his eyes. He looked up at the moon and stars. He shook his head and clambered awkwardly to his feet and looked carefully around him. The whole ranch house was on fire. The flames spat at the sky. Stanford stood there, feeling dazed, gazing over the desolate flatlands, the flames crackling and illuminating the darkness, and thought of only one thing: the parting words of the boy.

Auf Wiedersehen.

CHAPTER TWENTY-SIX

Lying on the double bed in the lodge in Mount Rainier, Epstein dreamt of the lights in the sky, rising gracefully, silently. He tossed and turned in his sleep, felt desolate sense of loss, wanting to follow the ascending lights, to drift up there through the darkness, to share in their serene, graceful majesty, to unravel the mystery. Then the dream changed. Epstein murmured and groaned out loud. He was on the flight back from Paris, flying high above the clouds, listening to the voice on the tape-recorder, the revelations astounding him. Then, suddenly, the whole airliner shook, rolling over, scattering passengers, a dazzling white light pouring through it, temporarily blinding him. Epstein shaded his eyes, ignored the screaming, tumbling passengers. The airliner leveled out again and he looked through the window and saw a flashing mass just above, gliding over the plane. It was the great mother ship, the one he had seen in the Caribbean, and Epstein watched as it came down on the airliner and then somehow swallowed it… In his sleep he tossed and turned. He looked down upon himself. He saw himself lying there on the bed, his eyes opening, frightened. He was surrounded by a group of men. They all appeared to be very small. They were wearing gray coveralls, they didn't say a word, and then one of them leaned over him and reached out and touched him… Epstein groaned aloud. He returned to the streets of Paris. He was seated in a restaurant in the rue de Rivoli, the old man talking into the tape-recorder, sipping cognac methodically. The old man was English. There was dandruff on his shoulders. He talked slowly, but with studied precision, and Epstein drifted away… He was just back from Paris, changing planes at Kennedy Airport. There were people all around him, rushing to and fro, shouting, and he felt inexplicably frightened to be there, though he didn't

know why… Then he was on another plane. The flight to Washington was uneventful. He glanced down at the clouds, a field of clouds, shifting slowly, and he checked the cassette tapes in his pocket because the fear was still with him… Epstein groaned in his sleep. He tossed and turned on the bed. He was in his office in Washington, DC, putting the tapes in his safe, obsessed with the notion that he was being followed, that someone was watching him. The office was deadly quiet. The ceiling lights stung his eyes. He heard the traffic along Massachusetts Avenue, still there even at midnight. Epstein locked the safe. He read the message from Stanford: his young friend was up in Mount Rainier, checking some recent sightings. Epstein felt tired and scared. The night faded into noon. He was in his car, driving up the mountains, the fear making him sweat… Epstein groaned and muttered something. He tossed and turned in his sleep. The lodge was empty and he found another message and lay down with his deepening fear. The fear increased and became unreal. Epstein opened his eyes. He saw the small men standing all around his bed, very quiet, looking down at him. Epstein felt a chill pass through him. They weren't men: they were boys. Then one of them, about fourteen years old, leaned over and touched him…

Epstein groaned and woke up, feeling cold and deeply frightened, thinking only of the cassette tapes in the safe and of what they might mean. He licked his lips and rubbed his eyes, saw the wooden beams above him, the room no longer dark, the lights on, a chair creaking beside him. He turned his head, expecting to see Stanford, but the man sitting in the chair was a stranger. Epstein sat up on the bed and rubbed his eyes and tried to stay calm.

The man was slim and sophisticated, wearing a black shirt and slacks, his eyes sky-blue and intense, his hair silvery and plentiful, parted neatly on the left and falling down over an uncommonly unlined forehead. He sat casually in the chair, his hands folded on his crossed legs, gazing straight at Epstein and smiling, a cold, remote smile.

'Who are you?' Epstein asked.

‘Wilson,’ the man replied. ‘You might remember me. Richard Watson mentioned my name. Is was there in the transcripts.’

‘How did you know about the transcripts?’

‘Richard told me,’ the man said. ‘We let him go and then we brought him back and he told us everything.’

The fear shivered down Epstein’s spine, made him numb, slightly unreal, and he rubbed his eyes and tried to waken up, still tired from his flights. The man was looking steadily at him. There was something odd about him. He seemed to be in his early fifties, a handsome man, extremely youthful, but the skin on his forehead was unlined, his cheeks as smooth as a boy’s.

‘You remember the transcripts?’ he asked.

‘Yes,’ Epstein said.

‘Then you should remember me,’ the man said. ‘I’m Wilson. I was present.’

Epstein shook his head, clearing it, feeling disorientated, not sure that this was actually happening, his fear slowly subsiding.

‘You’re Wilson?’

‘That’s right,’ the man said. ‘I know it must he something of a shock, but that won’t last too long.’ He smiled in that chilling manner, glanced casually around the room, then turned his gaze back upon Epstein, his blue eyes still bright. ‘Stanford’s on his way back,’ he said. ‘He’s been up in the mountains. He’s been checking on some UFO reports, but he hasn’t found much.’

‘How do you know? Epstein asked.

‘We’ve been watching him,’ Wilson said. ‘It was *my* flying saucers that were seen – and they’re up there right now.’

Epstein felt cold. He wondered if he was dreaming. After pinching his left wrist he knew he wasn't, and he shivered a little.

'*Your* flying saucers?'

'That's right,' Wilson said. 'Don't look so shocked. They're very real… and they're up there right now.'

'Where?' Epstein asked.

'Above the atmosphere,' Wilson said.

'Then our reconnaissance satellites will see them.'

'Indeed. They've been seeing them for years.'

Epstein wondered what he meant by that, wanted to ask but couldn't do it, still dazed from being jerked out of sleep, a throbbing pain in his stomach. He coughed and rubbed his tired eyes. The room seemed far too bright. Wilson uncrossed his legs, propped his elbows on his knees, then rested his chin in his cupped hands, studying Epstein intently.

'How are you?' he asked.

'What do you mean?' Epstein said.

'Your stomach,' Wilson said. 'Is it hurting? It must surely bother you a lot.'

'How do you know about my stomach?'

'Cancer's a very bad thing,' Wilson said. 'I myself have suffered ailments in the past, but all that's behind me now.'

'Behind you?'

'Yes, behind me. I used to have bad trouble with my heart, but I've managed

to mend it.'

'What are you talking about?' Epstein asked. 'I don't understand. What are you doing here in my room? Who let you in?'

'I have a pacemaker,' Wilson said. 'A very sophisticated device. It utilizes a piezoelectric crystal, a small balloon filled with water, and causes the heart's own pumping to stimulate itself. It is, of course, maintenance free. It does not require batteries. The miracles of science, Dr Epstein, are literally boundless.'

'Plastic surgery,' Epstein said.

'I beg your pardon?'

'I was looking at the skin on your forehead. You've had plastic surgery.'

Wilson smiled and nodded. 'Most perceptive of you,' he said. 'Plastic surgery, pacemaker, various organs replaced… Unfortunately I was one of the first. We're much more advanced now.'

'Who's we?' Epstain asked.

'My own people,' Wilson said. 'We're far removed from what you know, but that, too, can be remedied.'

Feeling that he was dreaming, Epstein blinked and glanced around the bright room and then turned back to Wilson.

'Who are you?' he asked.

'I created the flying saucers,' Wilson said. 'You've been trying to solve the mystery for twenty years and now I'm here to assist you.'

Epstein wanted to bang his head against the wall in the hope of waking up properly, but he didn't do anything. This all seemed too crazy.

‘*You* created the saucers?’

‘Yes,’ Wilson said. ‘They exist, they’re right here on Earth, and I’m the man who created them.’

‘For the Air Force?’

‘No.’

‘For the Navy?’

‘No.’

‘I don’t understand. I’m confused. I’m very tired. Who are you and what do you want with me? What are you doing here?’

‘You don’t believe me,’ Wilson said.

‘Of course not,’ Epstein said.

‘I won’t tell you where I’ve come from,’ Wilson said, ‘but I’m taking you back there.’

The fear slithered down Epstein’s spine. He could hardly believe that this was happening. He thought of Stanford and Scaduto, of his own trip to Paris, of the questions that sprang up and collided as the facts were revealed. He would have to keep his mouth shut. He would have to watch his man carefully. This man knew an awful lot about him and that couldn’t be good. He thought of the tapes in his safe. This man knew about the tapes. This man must be from the government or the FBI or the CIA; he already knew about the tapes and wanted to steal them and shut Epstein’s mouth. Epstein was truly frightened now. He didn’t know what to believe. He stared at the man sitting in the chair and felt threatened by him.

‘You’re from the government,’ Epstein said.

‘No,’ Wilson said. ‘The government saucers are relatively primitive. My saucers are the ones you’re been looking for.’

‘I don’t believe you,’ Epstein said.

‘I was in the Caribbean.’

‘The Caribbean?’

‘St Thomas,’ Wilson said. ‘It was my saucer that abducted Professor Gerhardt. You saw it. You and Stanford were on the beach.’

Epstein’s fear deepened considerably, made him suck his breath in, now starting to believe the man in the chair, having no other choice. He let his breath out when speaking.

‘You took Gerhardt?’ he asked.

‘Yes,’ Wilson said.

‘Where do you come from?’ Epstein asked. ‘How do you know about me? I can’t really accept what I’m hearing. This just doesn’t make sense.’

‘I built the saucers,’ Wilson said. ‘You’ve just found out how they started. You have that information down on tape. I want you *and* the tapes.’

Epstein licked his dry lips. He felt very badly shaken. Wilson’s eyes were sky- blue, almost steely with intelligence; he leaned forward and looked directly at Epstein, speaking softly and clearly.

‘We know all about you,’ he said. ‘We’ve been watching you for years. You’re a very tenacious man, you don’t stop, and now you’re dying of cancer. That makes you even more dangerous. You’ll be even more determined. We think you’ve found out too much already, so it has to end now.’

‘I’ve found nothing out,’ Epstein said.

‘You’re lying,’ Wilson said. ‘You’ve just returned from Paris where you were seeing Professor Ronald Mansfield, an Englishman who worked for the scientific division of the British Objectives Sub-Committee during World War Two and who is currently working for the *Groupment d’Etudes des Phénomènes Aériens*. That disturbed us, Dr Epstein. That’s as far as you can go. We want you and the tapes you brought back, which is why I am here.’

Feeling fearful, Epstein also felt paralyzed, removed from himself, not convinced this was really taking place.

‘You want me?’

‘That’s correct,’ Wilson said. ‘You will not see the dawn over Mount Rainier. You’re coming with us.’

Epstein didn’t know what to say. He wished that Stanford would return. This conversation was bizarre, not quite real, and he felt very strange.

‘I don’t have the tapes,’ he said.

‘Where are they?’ Wilson asked.

‘I didn’t tape the conversations,’ Epstein lied. ‘We just talked. He knew nothing.’

‘You’re lying again, Dr Epstein. I understand, but it’s pointless. We’ll just take you away tonight and then ask you – and believe me, you’ll tell us.’

‘What about Professor Mansfield?’

‘He hung himself yesterday.’

‘You mean you murdered him.’

‘That’s a very emotive word,’ Wilson said. ‘We simply did what we had to do.’

‘And what happened to Richard Watson?’

‘An interesting case. He had unusually strong resistance, great willpower, so we wanted him back with us.’

‘You’ve got him now?’

‘Yes. We were surprised at how much he told you. We implanted an electrode in his brain and he *still* showed resistance.’

‘He’s alive?’

‘He’s functioning. We’ll send him back soon. He’ll then do what we tell him to do – and he won’t be alone.’

‘Who’s we?’ Epstein asked.

‘I can’t tell you that right now.’

‘And is that what you do? You abduct them and robotize them. Then you send them back into the world and make them follow your orders?’

‘That’s right,’ Wilson said. ‘It’s not as incredible as it sounds. Bear in mind that such work has been going on for years – in America, in Russia, in Europe – and it’s highly advanced. Your people don’t understand this, they don’t know what’s really happening; they only hear about *acceptable* experiments – they don’t know the full extent of it. Electrocontrol is a fast-growing industry, being expanded behind closed doors. In your own society it’s relatively well advanced; in ours, much more so. Our own subjects begin in infancy – we take them out of the cradle. We implant electrodes in their brains, and at certain points in the spinal column, before they’ve even reached their fourth week. After that, they belong to us. They’re developed in

extraordinary ways. They're programmed for obedience, their capabilities are enhanced, and they never know the pain of discontentment.'

Epstein closed his eyes. 'The young boys,' he murmured.

'Ah, yes,' Wilson said. 'Stanford saw them. That must have confused him.'

Epstein opened his eyes again. 'And Richard Watson?' he asked.

'It's different with outsiders. Their advanced age makes all the difference. With outsiders we have to be more careful – and aren't always successful. Richard Watson was such a case. Strong willpower, great resistance. We've inserted another electrode in his skull and now he seems to be functioning.'

Epstein glanced around the room, feeling dreamy, almost haunted; he glanced out through the windows, at the darkness, heard the wind on the mountains. Stanford was out there. He was looking for UFOs. The irony of it made Epstein smiled, but then the fear trickled back again. He looked at the man called Wilson. The blue eyes were very bright. Epstein studied the smooth skin on his forehead and felt extremely uncomfortable.

'I don't believe this,' he said.

'What don't you believe?'

'I don't believe a damned thing you say. I think it's some kind of trick.'

Wilson offered his chilling smile. 'You'll believe soon enough,' he said. 'You've been wrestling with the mystery for twenty-odd years… Your reward comes tonight.'

'What do you mean?' Epstein asked.

'We're taking you away,' Wilson said. 'It doesn't matter where you go, where you hide… We'll just come down and pick you up.'

‘You’re not taking me now?’

‘It’s not convenient,’ Wilson said.

‘And what happens if I don’t leave this room?’

‘We’ll just open the door. This door or any other door that you’re hoping to hide behind.’ Wilson smiled and stood up, went to the window and stared out, turned back and looked down at Epstein, his blue eyes bright and cold. ‘You were in the Caribbean,’ he said. ‘You know what happened there. If we want someone, we just come and take them – and nothing can stop us.’

Epstein thought back on the Caribbean and remembered the howling wind, the hotel room going crazy, the dazzling light and intense heat; he recalled Stanford’s experience at the ranch in Texas about five months ago. White light and heat, fierce storms and shaking buildings; the manifestations were always the same, the causes unknown.

‘Did you cause the storms?’ he asked.

‘Yes,’ Wilson said. ‘Advanced weather engineering. Something similar to your own cloud-busters, but more sophisticated. Our own cloud-busters are laser-based and highly effective. The larger saucers can whip the wind up – or disperse it, if necessary.’

‘I don’t believe this,’ Epstein said.

‘Why not?’ Wilson said. ‘Cloud seeding is an established science. Orgone energy weather engineering is becoming more advanced every day, with floods and droughts engineered for political or military purposes. Of *course* we can cause a storm – so can the Russians and the Americans. Weather engineering is no longer a mystery – it’s an effective new weapon.’

‘And the cattle?’ Epstein asked.

‘For our laboratories,’ Wilson said. ‘For various drugs and vitamins and advanced medical research. Again, there’s nothing outlandish about it… a simple question of theft.’

‘And the people? The kidnapped people?’

‘Like the cattle,’ Wilson said. ‘Some are used as slave labor, some are robotized and returned, some are sent to the medical laboratories as guinea pigs for our research.’

‘That’s horrible,’ Epstein said.

‘The word “horrible” is redundant. The spider eats the fly and in turn is devoured; all that lives in the present supports the future and has no other purpose. Nothing is horrible, Dr Epstein. As a scientist you should know that. Blood and suffering is the constant of the laboratory – and is vital to progress.’

‘We’re talking about human beings.’

‘Indeed we are,’ Wilson said. ‘And human beings are no more than the rungs on evolution’s great ladder. Science is all, Dr Epstein. The mysteries of life must be uncovered. Science can’t progress as it should if it’s held back by sentiment. Humans live and die anyway; they do so to no purpose. Only science can stop this primitive wastage and make people useful. Free choice leads to conflict and wastage, and is harmful to progress. Emotion is wasted energy. Moral judgements hold back science. There are too many people, there is too much human wastage, and we have to accept that human life is just cement for the future. To merely exist is not enough: what we need is a new *form* of being. We must learn how to take the human being apart and reconstruct him as something else. A superior being. A creature devoid of contradictions. And the gulf between Man and Superman can’t be bridged with emotions.’

‘That’s still horrible,’ Epstein said.

‘You’re still a primitive,’ Wilson said. ‘Where you’re going, you will not feel the same: you will come to accept it.’

‘Where *am* I going?’

‘You’ll find that out soon enough.’

‘I don’t believe this,’ Epstein said. ‘I *can’t* believe it. It just doesn’t seem real.’

‘Time will tell,’ Wilson said.

Epstein closed his eyes again. He felt weak and light-headed. In the darkness behind his closed eyes he saw the void of the cosmos. Not a void: something else. The voids of space were filled with energy. Beyond the galaxies, in what seemed like a void, possibilities were boundless. Where would Man go? What would he become? Epstein opened his eyes and tried to accept what it was he was hearing. He had searched for twenty-odd years, had lived constantly with the mystery, and now, face to face with the answers, his fear overwhelmed him.

‘The flying saucers are real,’ he said.

‘You know that,’ Wilson said. ‘What you heard in Paris must have convinced you, so the question’s superfluous.’

‘What are they?’ Epstein asked.

‘You already have the basic facts. We’ve progressed enormously since then, but the basics remain. At present, apart from the systems that Mansfield doubtless told you about, we utilize advanced ion propulsion, electromagnetic propulsion, in certain cases nuclear fusion pulse rockets, and, for the giant saucers, the carrying ships, an antigravity field. Ionization and

electromagnetic discharges account for the plasmalike glow that so fascinates your witnesses, the antigravity accounts for the lack of turbulence and sonic booms; and you and Stanford have already discussed – with reasonable accuracy – the cause of the abrupt invisibility.'

'How did you know that?' Epstein asked.

'We bugged your rooms,' Wilson said. 'Nothing is new under the sun – we've simply made advances.'

'And the antigravity shield accounts for your crews' apparent ability to withstand the extraordinary speed and direction changes of your saucers?'

'Precisely. The gravity-shield force applies simultaneously to the crew *and* the saucer… And, since it provides a cushion of air around the saucer, it also prevents the saucer from heating up. Incidentally, I should point out, since you're looking so disbelieving, that antigravity is not as revolutionary as it seems. Indeed, as far back as 1965 there were at least forty-odd *unclassified* G-projects being undertaken in America alone – by the Air Force, the Navy, the Army, NASA, the Atomic Energy Commission and the National Science Foundation. Since these were the *unclassified* projects, I need only point out that considerably more advanced projects are doubtless underway right now in strict secrecy.'

'Are you suggesting that you're connected to the US government?'

'No, I'm not saying that.'

Epstein couldn't think straight. He stared at Wilson, at the icy blue of his eyes, then he remembered Dr Campbell, what he had related about hypnosis, and, remembering this, thought that he should try to get off the bed… But Wilson spoke and that stopped him.

'It's all right,' Wilson said.

‘Yes,’ Epstein said, no longer worried, simply wanting to know more. ‘We keep receiving reports of different-sized UFOs, and that always confuses us…’

‘The smallest saucers are similar to your own CAMS – Cybernetic Anthropomorphous Machine Systems, either remote-controlled or programmed to react to certain stimuli, used mainly as sensing devices or probes. Taking the Richard Watson case, the beam of light that shone into the car was merely a laser beam on a wavelength that freezes skeletal muscles or certain nerves – thus producing either temporary paralysis or a trancelike condition.’

‘And the other saucers?’

‘The first group are anything from five to fifteen feet in diameter. Again, these are highly complex CAMS, either flying with their long axis vertical or flying in the direction of their axis, used mainly for reconnaissance and basic manual tasks, such as the collecting of soil or water, and controlled by Remote Manipulator Systems not much different from normal ones. The second group, usually about twenty-five to thirty-five feet in diameter, are extensions of the first group, but revolving around their axis and controlled by extremely advanced cyborg crew members. The pilot that Richard Watson saw in the second saucer was just such a cyborg: half man, half machine – the results of over thirty years of prosthetic experiment. The cyborg’s respiration and other bodily functions are controlled cybernetically with artificial lungs and sensors that maintain constant temperature, metabolism and pressure, irrespective of external environmental fluctuations – thus they aren’t affected by the extraordinary accelerations and abrupt direction changes of their saucers. The third group of saucers can range from one hundred to three hundred feet in diameter, can be up to several stories tall internally, are used mainly to pick up people and animals and material goods, and have a crew of about a dozen men. The fourth category is the carrying ship – what you people call the “mother” ship – a somewhat gigantic affair, used for major

operations of a long-term nature. The carrying ships are essentially self-generating airborne colonies, capable of drifting in outer space or of hibernating on the sea bed, manned by a large crew of humans and cyborgs, the heavy labor performed by programmed slaves, and containing workshops, laboratories, medical wards, cryonic preservation units, and hangars for all the other, smaller saucers.'

Wilson smiled as he talked to Epstein, a distant, cool smile, his lips dutifully performing the necessary while his eyes remained hard. His eyes fascinated Epstein, repelled him and drew him in, unblinking, as clear as sunlit ice, making Epstein feel unreal. And yet the man sounded reasonable, talking quietly, precisely, explaining with the patience of a teacher, making everything simple.

'You must be highly advanced,' Epstein said.

'Yes,' Wilson said, 'we are. Our society is based on masters and slaves – and exists just for science.'

'Where is it?' Epstein asked.

'Just be patient,' Wilson said.

'Please tell me now. I want to know.'

'You'll find out soon enough.'

They stared at one another, the silence broken by the wind outside, the light in the room extremely bright, the window framing the dark night.

'You said that the carrying ships can hibernate on the sea bed,' Epstein said eventually. 'Is there a connection between that fact and the mystery of the Bermuda Triangle and other areas reported to be like it?'

'Yes,' Wilson said. 'We have permanent undersea laboratories in the

Bermuda Triangle, the so-called Devil's Sea between Guam, Luzon in the Philippines, and the southeast coast of Japan, and another off the coast of Argentina. These laboratories are manned by cyborgs and a few programmed scientists, and are visited frequently by the carrying ships.'

'And it's your carrying ships that cause the unusual magnetic disturbances in those areas?'

'Yes.'

'I can't accept that you could construct such undersea laboratories without being seen by *someone*… By the crews of passing ships or aircraft.'

'Various governments know we're down there, and in fact cooperate with us. As for the actual construction of the laboratories at such depths, you have to appreciate the unusual dimensions and capabilities of the carrying ships. For a start, their interior space is immense. The carrying ship simply settles near the sea bed and the laboratory is constructed inside it. The base of the carrying ship then opens up and deposits the laboratory, complete with crew, on the sea bed. The permanent fixing of the laboratory to the sea bed is accomplished with the aid of specially reinforced, remote-controlled CAMS, and then the carrying ship ascends to the surface, leaving the laboratory down there.'

'And various governments *know* you're down there?'

'Yes.'

'But you don't belong to any of those governments?'

'No.'

'Will you explain that?'

'Not yet.'

Wilson smiled bleakly and turned back to the window, looked out as if searching for someone, then glanced up at the night sky.

‘Our reconnaissance satellites,’ Epstein said. ‘Is it true that they’ve seen you?’

‘Yes,’ Wilson said, turning back to the front. ‘Naturally. How could they miss us? They’ve been seeing us for years.’

‘Then they’ve been covering up for years.’

‘Of course,’ Wilson said. ‘There’s nothing particularly unusual about that – they’ve been covering up everything.’

‘I don’t know what you mean.’

‘Don’t you? What about all their secret research programs: their chemical warfare programs, their advanced weaponry programs, their secret achievements in aeronautics and communications and neurology; their covert operations against, and their clandestine agreements with, the Soviets and the Chinese and the Third World countries? The private citizen know precious little. He knows only what they deign to tell him. Governments cover up everything, from their politics to science, and when it comes to something as big as our saucers, they cover up even more.’

‘Why?’ Epstein asked.

‘Because they don’t trust the people. Because there isn’t a government in the world that still believes in Democracy.’

‘What’s your connection to them?’

‘I can’t tell you that,’ Wilson said.

‘You’re not an extraterrestrial,’ Epstein said. ‘That much I know.’

When Wilson offered a faint, possibly victorious smile, Epstein flushed like a guilty schoolboy, thinking of the cassette tapes in his safe, knowing that Wilson had tricked him.

‘Ah, yes,’ Wilson said. ‘Professor Mansfield. He must have told you a lot.’

Epstein burned and then cooled down, his throbbing stomach now at peace, feeling bright to the point of unreality, removed from his woes. He wondered where Stanford was, wished that Stanford would return. The wind moaned outside, sweeping over the darkened mountains, and he thought of the UFO sightings over the Cascades, of what Scaduto had told them. The truth emerged in small pieces. It lay before him like a jigsaw. There were still missing pieces, gaping holes, and the clock ticked the time away.

‘The harassment,’ Epstein said. ‘The suicides and disappearances. I take it that they’re part of the cover-up and that you engineered them.’

‘Some of them,’ Wilson said. ‘It depends on the circumstances. The actual harassment was usually arranged by your government, but most of the deaths and disappearances were due to us.’

‘Most?’

‘Not all. Occasionally your government steps in and does a job on its own.’

‘Then they work with you,’ Epstein said.

‘On and off,’ Wilson said. ‘As with all political situations, the agreements are tenuous and are prone to break down at any moment. We negotiate with the US government. We also negotiate with the Soviets. We trade and play one against the other because we haven’t much choice yet.’

‘Yet?’

Wilson smiled again. ‘The Nuclear Deterrent, the Balance of Terror, is a

precarious business.'

'And you're in the middle?'

'Yes,' Wilson said. 'We straddle the seesaw…But we'll soon tip the other two off.'

Epstein felt very calm now, divorced from himself, the pain in his stomach gone, the fear disappearing with it, the bizarre nature of the whole conversation making it seem unreal. He didn't know what to think, felt distant, almost placid, well aware that this man had done something to make him accept it all. The revelations were stunning, ambiguous, fascinating, and yet he now thought they sounded quite reasonable, down-to-earth, even commonplace. He wondered if he was hypnotized: stood outside himself and thought this. He saw that Wilson was now standing at the window, staring up at the night sky.

'You killed Irving,' Epstein said.

'Irving Jacobs?'

'Yes. You killed him. Why did you do that?'

Wilson returned to his chair, sat down, stared at Epstein, not smiling his sky-blue eyes bright, filled with icy intelligence.

'He was digging too deep,' he said. 'He'd found out too much. Your own government was disturbed by his findings and wanted us to get rid of him. They didn't want to do it themselves. They didn't dare use their own men. They didn't want the FIB or the CIA to go anywhere near him. So, we worked on him. We had him followed and harassed. When he grew frightened, when his resistance was low, we used long-range telepathy. We stole part of his mind that way. We made him think he was possessed. In the end we made him drive out to the desert where we came down on top of him. We didn't need him as a scientist – we have plenty in that field – so we

simply stuck the pistol in his mouth and made it look like suicide.'

Epstein should have been shocked, but he felt nothing at all. He thought of Irving and Mary and the old days, but they seemed far away.

'You use mental telepathy?'

'Yes,' Wilson said. 'Certain brain implants can enhance telepathic powers and actually lead to nonverbal communication. Some of the children, and all of the cyborgs, communicate that way.'

'Were you involved with the woman from Maine?'

'Yes. We were experimenting and the woman from Maine picked us up and then told the CIA. The agent she first informed knew nothing about us *or* their own government's saucers; but the Canadian government, when they heard about her, were naturally more concerned, thinking she might have picked up some Soviet signals. Bearing in mind that only a limited number of government and military personnel knew about the existence of the saucers, it was unfortunate that the agents who first interrogated the woman knew nothing about what was going on. However, at the second meeting, some of the military officers present knew all about the saucer programs – and it was they who subsequently buried the incident and transferred the CIA agents who were in the office at the same time, but didn't know what was happening.'

'Our informant said it was a Canadian-US saucer.'

'An understandable error. Unfortunately, it was an error that led to your friend Scaduto spying on the Canadian plants. Mr Scaduto recently died of an unexpected heart attack. You can blame that on Stanford.'

The remark hardly affected Epstein. He felt calm and interested. The man speaking sounded absolutely reasonable; the revelations seemed commonplace.

‘What about Irving?’ Epstein asked.

‘I’ve already told you about him.’

‘You didn’t tell me what he’d found out. I’d like to know that.’

‘Jacobs was interested in the deaths and disappearances of so many of his contemporaries, and this encouraged him to investigate the Jessup case. In doing so, he discovered that the US Navy had, back in 1943, been experimenting with pulsating and vortexual high intensity magnetic fields that might alter the molecular structure of physical properties and render them temporarily invisible. This experiment became known as the Philadelphia Experiment, but contrary to popular belief it was a disaster. What in fact happened was that the Navy inadvertently created a source of electromagnetic energy that produced an infrasound of such intensity it killed every sailor on board the ship and actually split the ship’s hull. In short, the ship rumored to have disappeared actually sank – and naturally, since the Navy didn’t want word of this to leak out, they whipped up a mass of rumors that acted as a cover-up and led to the contemporary myth… However, in investigating this incident, Dr Jessup learnt that the Navy’s basic scientific principles were valid, that the Navy and Air Force were involved in saucer projects, and that those projects were utilizing certain aspects of the original Philadelphia Experiment. Having found out about this, Jessup had to be removed… Then Jacobs found out much the same thing and also had to be terminated.’

‘I see,’ Epstein said. ‘And those principles were also the principles underlying the invisibility-inducing properties of your saucers?’

‘Correct. A specific quantity of electromagnetic radiation creates a stream of escaping photons of the same wavelength and frequency, which leads either to a glowing, plasmalike shield or to a color source beyond the known spectrum that renders the saucer invisible.’

‘How does this relate to the annotations in Jessup’s book? The ones that stimulated the interest of the Office of Naval Research.’

‘That was something of a red herring,’ Wilson said. ‘In 1955 the Navy was still experimenting with the possibilities of electromagnetically-induced invisibility. They were then, and remain today, unsuccessful. Nevertheless, they were disturbed by some of Jessup’s published remarks – and the annotations in that copy of his book had been made by their own intelligence officers, and related only to the sections that discussed force fields and dematerialization. The Navy wanted to know the source of his information, Jessup naturally refused to reveal it, then Jessup walked out of their office – and that’s all there was to it.’

‘You had nothing to do with the annotations?’

‘No, not a thing.’

Epstein closed his eyes, let himself drifting away, drifting down through the darkness and the long years he had labored, feeling calm, then feeling confused and drifting back up again. He thought of the cassette tapes in his office, of the old man now dead, thought of everything the old man had told him, wondered what it might mean. He had to get the tapes to Stanford. If nothing else, he had to do that. He now knew that they would take him away, and that he would not resist. He didn’t want to resist. His curiosity was too great. He opened his eyes and saw Wilson by the window and felt a great peace.

‘I have to go now,’ Wilson said. ‘When I depart, you’ll fall asleep. When you wake up, you’ll do what you feel like – because the choice won’t really be yours.’

‘I’m confused,’ Epstein said.

‘By what?’

‘You’re not an extraterrestrial, you’re from Earth, and you created the saucers. That’s what confuses me. It just doesn’t make sense. The first genuine UFO sightings were in 1897 – the Great Airship Scare – yet you say you’re the man who created them.’

‘That’s correct,’ Wilson said. He turned away from the window, walked back to the bed, and stood there, staring down at Epstein, his blue eyes exceptionally bright. ‘I’m one hundred and seven years old,’ he said. ‘You, too, can live that long.’

CHAPTER TWENTY-SEVEN

Approaching the lodge after his long day in the mountains, covered in snow and freezing, Stanford desperately wanted sleep, a respite from it all, an escape from the fear that now dogged him every day and was encouraged by his present state of exhaustion. The snow was deep and clean, drifting lazily upon itself, sweeping languidly around trees, the moonlight making it glisten, the wind moaning and scraping at his nerves, the mountains looming above him. Stanford longed for the lodge, for its safety and warmth, but when he saw it, the fear increased greatly and make him stop walking.

All the lights inside were on. The front door was ajar. A beam of light fell from the doorway to the porch, illuminating the snow that drifted along the wood boards. Stanford stood beneath some pines, not moving, his heart pounding, wondering why the lights were on, who was in there, his head spinning with feverish thoughts. He knew he was being foolish, felt ashamed of it, couldn't stop it, recalling the boys in gray coveralls, the burning ranch and the vanished girl, remembering Gerhardt's abduction and Scaduto's recent suicide, and the fact that *they* knew who he was and might come back again…

Stanford cursed quietly and shivered, wiped snow from his face. He thought of the lights he had seen above the mountains, ascending vertically, abruptly shooting sideways. Not descending: *ascending*. Not meteors: *unidentifieds*. Stanford shivered and stared straight ahead, the panic emptying his mind, then he shook his head from side to side, realizing it was Epstein, cursed again, started walking again.

He climbed the wood steps, pushed the door open and entered. Glancing around the living area, seeing no sign of Epstein, he wondered why he had left all the lights on, then went into the bedroom. Epstein was sitting on the bed, wearing pajamas, looking sleepy, his hands folded primly in his lap, his gaze fixed straight ahead.

‘You got my message?’ Stanford asked.

‘Yes,’ Epstein replied.

‘It’s been a bitch of a day,’ Stanford said. ‘They’ve been all over the place.’

‘Unidentifieds?’

‘Yes.’

‘What kind?’

‘Just lights. They’ve been flying all over Mount Rainier, but they never came close.’

‘No landings?’ Epstein asked.

‘None reported,’ Stanford said. ‘Most of the lights were high up, standing still, then shooting sideways, racing to and fro across the mountain peaks, disappearing, returning. Then this big light came down. All the smaller lights went into it. Then the big light climbed vertically and disappeared and hasn’t been seen since. That was an hour ago.’

Epstein nodded judiciously, gazing down at his folded hands, very frail in his pajamas, too frail, a man fading away. Stanford noticed the frailty – that and something else: a remoteness, a sort of dreamy look that seemed distinctly unnatural.

‘Are you okay?’ he asked.

‘Yes,’ Epstein said. ‘I’m fine.’

‘And how was Paris? What did you find out?’

‘You were right. It was Germany.’

Stanford was taking off his jacket, but he stopped and stared at Epstein, his shock mixed with fear and excitement, disbelief and wild hope. Shrugging his jacket back on, he took a deep breath and released it slowly, snow melting on the shoulders of the jacket and dripping down to the carpet.

‘Germans?’

‘I don’t know,’ Epstein said. ‘I assumed so at first, but now I’m not so sure. I’m confused. I don’t know what to think.’

‘What has you confused?’

‘I have some cassette tapes,’ Epstein said. ‘It’s vital that you hear them. From what I was told in Paris, it seems almost certain that the Americans and the Canadians, and possibly the British, have their own flying saucers… But Scaduto was right: there are others involved. I don’t know who they are or where they come from or what they’re up to, but I *do* know that they’re not extraterrestrials and that they’re advanced to a frightening degree… It’s vital that you hear the tapes. They’re in my safe back in Washington. It’s vital that you go there right now and get them out of the safe.’

‘Right *now*?’

‘Yes.’

‘That’s ridiculous,’ Stanford said. ‘I’m exhausted. Just tell me what’s on them.’

‘There’s no time,’ Epstein said. ‘The tapes aren’t safe anymore. They want

me and the tapes and they'll get both before dawn breaks. You have to get there before them.'

Stanford stepped up to the bed and looked intently at Epstein, thinking that his friend had gone mad, wondering what he was talking about. Epstein was leaning against the pillows, his hands folded on his lap, his gray beard more shaggy than usual, his eyes slightly unfocused.

'What are you talking about?' Stanford asked. 'I'm not sure I heard you right. *Who's* going to get you and the tapes?'

Epstein didn't look up. 'I had a visitor,' he said. 'He murdered the Englishman and Scaduto. Now he wants me and the tapes. He said he'll have both by first light.'

'A visitor?'

'Yes. He came here. He left just before you arrived. He knew all about Irving and Gerhardt and Richard Watson, about you, about me on the beach in the Caribbean. He knew about your encounter with the boys outside the ranch in Texas, and he knows about a lot of other things that he really shouldn't know. He's one of them, Stanford. He told me about saucers. He told me enough to convince me. I've no doubt that he'll get me.'

Stanford sat on the edge of the bed, the melting snow still dripping off him, and stared at his old friend for some time before talking again.

'Tell me,' he said.

Epstein recounted the whole story, his voice eerily calm and remote. Stanford was fascinated, at once frightened and excited, his head filling with bright lights and pulsating coronas and glittering stars that moved majestically through black night and then blinked out abruptly. Epstein's voice sounded tired, almost toneless, distracted, filtering through Stanford's thoughts and out again. Stanford listened, mesmerized, the room dissolving around him,

not fully comprehending what he was hearing, overwhelmed and struck dumb. Then Epstein stopped talking, sighed forlornly, examined his hands, turning them this way and that, and the walls of the room reappeared as the real world crept back. Stanford glanced around him, wondering where he was, *who* he was, then he managed to get a grip on himself, focusing once more on Epstein.

'I find it hard to believe,' he said.

'It's all true,' Epstein said.

'Jesus,' Stanford said. 'It's too much. I just can't get a hold on it.'

Epstein coughed into his fist. 'You have to leave now,' he said. 'It's vital that you get all the tapes before *they* make me talk.'

'What makes you so sure you'll talk?'

'Because I'm convinced they'll hypnotize me. Either that or they'll put an electrode in my brain like they did to young Richard Watson.'

'You think they're coming back here tonight?'

'Before first light,' Epstein said. 'So it's vital that you leave right now and get there before them.'

'Me?' Stanford said.

'I'm not going with you,' Epstein said.

'What the hell do you mean, you're not coming with me? You can't just sit there and *wait* for them.'

Epstein's hands were shaking. 'I don't want to go,' he said. 'I've been trying to unravel this mystery for twenty years and now I'm going to have all my questions answered. They're going to take me with them. I can't miss this

opportunity. I want to know who they are and where they come from, so I'll have to go with them.'

'Are you crazy?' Stanford said. 'Go with them and you won't be coming back. Those bastards aren't doing you any favors: once you go, you'll be *gone*.'

Epstein shrugged, smiling sadly. 'So what?' he said. 'Look at me. I look like a shadow of my former self. I've only about a year left anyway, so what can I lose?'

'You're crazy,' Stanford said.

'I have to know,' Epstein said. 'I can't die without knowing the whole story – and this is my chance.'

'I won't let you.'

'Get the tapes.'

'No, damn it,' Stanford said. 'I won't let you stay here. That's it. Now put your clothes on.'

Epstein looked up at Stanford, smiling sadly, remotely; he was staring directly at Stanford, but not really seeing.

'Leaving is pointless,' he said. 'If they want me, they'll get me. It doesn't matter where I go, where I hide, because they'll know where to find me.'

'Don't bet on it.'

'I *would* bet on it.'

'Shut up,' Stanford said. 'I'm not listening. Now put your clothes on.'

Epstein smiled and nodded agreement, swung his legs off the bed, stood up

and started dressing himself like a man still asleep. It didn't matter if he left. He was certain that man would find him. He was certain that no matter what he did, that man would know he was doing it. This thought offered him some comfort, eased his pain, helped him relax, now enraptured with the thought of the revelations that would soon set him free. He would not die defeated. Death would not have dominion. He would wait and they would come, the night would turn to dazzling light, and he would blink and then open his eyes and see a world beyond reckoning. Epstein put his clothes on. When he was dressed, he glanced around him. He had only been here a few hours and yet he felt an odd sadness. It was not a painful sadness. His feeling of loss was couched in joy. Epstein buttoned up his coat and smiled at Stanford, prepared for just about anything.

'Okay?' Stanford said.

'Okay,' Epstein said.

'Right, Professor Epstein, let's go. Let's get the hell out of here.'

They crossed the pine floor of the lodge, stepped out onto the porch, felt the cold and saw the snow falling as Stanford locked the front door. Stanford took hold of Epstein's elbow, guided him down the slippery steps. The snow was thick on the ground, drifting lazily, as they walked to the car. Stanford helped Epstein in, holding his arm, keeping his eye on him, then he closed the door and went around the car and slipped into the driver's seat. Epstein said nothing, simply smiled and looked ahead, as Stanford started the car and headed out through the tall, snow-lined trees.

'Are you all right?' he asked.

'Yes, I'm fine,' Epstein said.

'Are you sure? You're being pretty quiet.'

'I feel fine,' Epstein said.

Stanford drove between the trees, the snow gleaming in the darkness, the mountains jagged against the star-filled sky, rising up all around them. Stanford drove carefully, squinting against the falling snow, his headlights picking out tree-trunks and rocks and banks of exposed soil. He was nervous, excited, not sure what he was doing, glancing frequently at Epstein, at his smile, and wondering what he was thinking. The car rolled down the narrow track, the trees seeming to glide past it, the snow drifting dreamily across the track, the darkness total beneath them.

'You know, it fits,' Stanford said, breaking the silence between them. 'A lot of what that guy, that Wilson, told you fits. The application of an antigravity shield *could* result in a virtually massless body. Now, according to technical analysis the lift-off of your average UFO would require as much energy as the detonation of an atomic bomb, would cause the body of the UFO to heat up to about eighty-five thousand degrees centigrade, and would lead to intense deposits of radioactivity. However, with an antigravity shield reducing the mass of the UFO to almost zero, it would only require a very modest force to reach exceptionally high accelerations. That would account for the UFOs' ability to disappear in the blinking of an eye and for the fact that they can be brought to an abrupt stop. It would also explain why they can make such normally impossible right-angle turns. Since we can also assume safely that the inertial mass of such a UFO would decrease the higher it goes, we can then reason that such a mass would be reduced to almost zero by the time it reaches the limits of Earth's atmosphere. This would explain why the UFOs invariably have what appears to be a two-stage take-off: a slow rise to about a hundred feet or so, then a sudden acceleration and disappearance. Finally, since the UFOs' performance is directly related to Earth's gravity, and since the pull of gravity varies slightly from place to place, we now know why a UFO in horizontal flight often appears to rise and fall slightly: the increase and decrease of gravitational pull would affect the inertial mass of the UFO and make it bob up and down slightly; this would also explain why the UFOs appear to be able to automatically follow the profile of the terrain below… So, the facts fit.'

Still smiling sadly, his hands folded in his lap, his eyes slightly unfocused, fixed on the downhill road, Epstein nodded to indicate agreement.

‘Still,’ Stanford said, ‘it’s pretty fantastic. Wilson claimed he was a hundred and seven years old. If that’s true, he’s not human.’

‘You don’t think so?’ Epstein asked.

‘No, I don’t think so. If that guy comes from Earth, I can’t buy that. It’s just too incredible.’

‘I’m not so sure,’ Epstein said. ‘Bear in mind that whoever these people are, they’re obviously extraordinarily advanced in their technology. Now, according to Wilson that technology includes medical and psychological research with no restraint on the part of the researchers. They’re definitely far advanced in parapsychology and prosthetics, and they practice vivisection on human beings.’

‘Jesus Christ,’ Stanford said.

‘Yes,’ Epstein said, ‘it’s horrible. But no matter, that’s certainly what they’re doing. Now assuming that their medical and surgical research is as advanced as their other sciences, it’s not unreasonable to assume that Mr Wilson is the age he claims to be. What I *can* tell you is that his face was reconstructed with plastic surgery, that he uses a technologically advanced pacemaker, and that he’s had various organs replaced. He also informed me that the work on him was performed at an early stage of their technology and that those methods were now considered to be relatively primitive. Presumably, then, it is indeed possible that Mr Wilson is a hundred and seven years old.’

‘What does that make his date of birth?’

’1870.’

‘No,’ Stanford said, ‘I can’t accept this.’

‘Think again,’ Epstein said. ‘A few people have actually managed to live to that age – and without medical assistance. Add medical and surgical assistance of the most advanced kind, and Mr Wilson could be exactly what he says he is.’

‘Okay,’ Stanford said. ‘But *who* is he?’

‘Have you ever heard of a Wilson in relation to UFOs?’

‘No,’ Stanford said. ‘I can’t think of anyone, except… No, it’s too ridiculous for words.’

‘What’s ridiculous?’ Epstein said. ‘Don’t be shy. I want to know what you mean.’

Stanford shook his head from side to side, expressing disbelief regarding what he was thinking. The headlights of the car were boring into the darkness as the vehicle moved downhill, the road winding around canyons and ravines, the land on both sides below them.

‘The flap of 1897,’ Stanford said. ‘The first real modern sightings.’

‘Don’t blush,’ Epstein said. ‘Just keep talking. Make good use of that famous photographic memory of yours. I want every detail.’

‘Okay,’ Stanford said. ‘As you know, the first major UFO flap was in 1896 – about November of that year – and continued until May the following year. This was five years *before* the Wright brothers’ experiments, but there were, by that time, various airship designs on the drawing boards or in the Patent Office. On August 11, 1896, a patent was given to Charles Abbot Smith of San Francisco for an airship he intended to have ready by the following year. Another patent for an airship was issued to Henry Heintz of Elkton, South Dakota, on April 20, 1897. However, I should point out that while many of the UFOs sighted were shaped roughly like the patent designs, there is no record of either airship having been built.’

‘But the UFOs looked like airships?’

‘At that time the general belief was that aerial navigation would be solved through an airship rather than a heavier-than-air flying machine – so most of the earlier designs looked like dirigibles with a passenger car on the bottom.’

‘Cigar-shaped.’

‘Correct.’

‘Please continue.’

‘Okay, what stands out in the 1896 and 1897 sightings is that the UFOs were mostly cigar-shaped, that they frequently landed, and that their crews, normal men, often talked to the witnesses, usually asking for water for their machines. Now, the most intriguing of the numerous contactee stories involved a man who called himself Wilson. The first incident occurred in Beaumont, Texas, on April 19, 1897, when a guy called Ligon, local agent for Magnolia Brewery, and his son, noticing lights in the Johnson pasture a few hundred yards away, went to investigate. They came upon four men standing beside a large, dark object that neither of them could see clearly. One of the men asked Ligon for a bucket of water. When Ligon gave it to him, the man gave his name as Mr Wilson. He then told Ligon that he and his friends were traveling in a flying machine, that they had taken a trip, quote, “out of the Gulf”, and that they were returning to the, quote, “quiet Iowa town” where the airship and four others like it had been constructed. When asked, Wilson explained that electricity powered the propellers and wings of the airship. Then he and his friends get back into the airship and Ligon, with his son, watched it ascending.

‘The next day, on April 20, a Sheriff Baylor of Uvalde, also in Texas, went to investigate a strange light and voices in back of his house. He encountered a parked airship and three men – and one of the men gave his name as Wilson, from Goshen, New York. Wilson then inquired about a Captain Akers,

former sheriff of Zavalia County, saying that he'd met him in Fort Worth in 1877 and wanted to see him again. Surprised, Sheriff Baylor replied that Akers was now at Eagle Pass, and Wilson, apparently disappointed, asked to be remembered to him the next time Sheriff Baylor saw him. Baylor reported that the men from the airship wanted water and that Wilson requested that their visit be kept secret from the townspeople. Then he and the other men climbed back into the airship and watched it fly away northward in the direction of San Angelo. The county clerk also saw the airship as it was leaving the area.

'Two days later, in Josserand, Texas, a whirring sound woke farmer Frank Nichols, who looked out of his window and saw what he described as brilliant lights streaming from, quote, "a ponderous vessel of strange proportions" in his cornfield. Nichols went outside to investigate, but before he reached the object, two men walked up to him and asked if they could have water from his well. Nichols agreed to this – as farmers in those days invariably did – and the men then invited him to visit the airship where he noticed that there were six or seven crew members. One of these men told Nichols that the ship's motive power was highly condensed electricity and that it was one of five that had been constructed in, quote, "a small town in Iowa" with the backing of a large stock company in New York.

'The next day, on April 23, witnesses described by the *Houston Post* as two responsible men reported that an airship had descended where they lived in Koutze, Texas, and that two of the occupants had given their names as Jackson and… Wilson.

'Four days after this incident, on April 27, the Galveston *Daily News* printed a letter from Captain Akers, the former sheriff of Zavalia County, who claimed that he had indeed known a man in Fort Worth named Wilson, that Wilson was from New York, that he was in his middle twenties, and that he was of a, quote "mechanical turn of mind" and was then working on aerial navigation and, in his own words, *something that would astonish the world*.

‘Finally, early in the evening of April 30, in Deadwood, Texas, a farmer named Lagrone heard his horses bucking as if in stampede. Going outside, he saw a bright white light circling over the fields nearby and illuminating the entire area before descending and landing. Walking to the landing spot, Lagrone found a crew of five men, one of whom talked to him while the others collected water in rubber bags. The man informed Lagrone that his airship was one of five that had been flying around the country recently, that his was in fact the same one that had landed in Beaumont a few days before, that all the airships had been constructed in an interior town in Illinois – which, note, borders Iowa – and that he was reluctant to say anything else because he hadn’t yet taken out any patents. By May that same year, the airship sightings ended.’

The car rolled on down the mountain, snow still sweeping across the road, the dense forests gliding by on both sides, white and ghostly in darkness.

‘Interesting,’ Epstein said. ‘It’s certainly beginning to add up. And this Wilson appeared to be in his early twenties?’

‘Exactly,’ Stanford said. ‘So assuming, as our Wilson claims, that he’s a hundred and seven years old, in 1897 he’d have been twenty-seven.’

‘It fits,’ Epstein said. ‘Most of the facts fit. For instance, Wilson said that he’d originally studied aeronautics at the Massachusetts Institute of Technology and then at Cornell, New York.’

‘You’re kidding,’ Stanford said.

‘No, I’m not. He said he went to the MIT, but eventually left it to study under Octave Chanute… Does that make any sense to you?’

‘Oh, Christ, yes,’ Stanford said.

The snow swept across the headlights, the alluvial hills slid past, the sky formed a long, glittering ribbon between gaps in the trees.

‘It’s hard to believe,’ Stanford said, ‘but it’s possibly true. Although there were no formal aeronautical courses at the MIT during the early 1890s, there were plenty of informal courses on propulsion and the behaviour of fluids. However, by 1896 instructors and students at the MIT had built a wind tunnel and were experimenting with it to get practical knowledge of aerodynamics. Wilson – our Wilson – could have attended those courses and then gone on to Sibley College, Cornell University, in Ithaca, New York, where, by the mid-1890s, it was possible to get a Bachelor of Science in Aeronautics.’

They were coming out of the mountains, the road straightening and leveling out, a dizzying drop on one side, soaring hills on the other, the snow banked up on both sides of the car, gleaming white in the darkness.

‘So,’ Epstein said. ‘Wilson was born in 1870. In 1890, at the age of twenty, he was studying propulsion and the behaviour of fluids at the MIT, after which he went on to Cornell to study aerodynamics. Let us say, then, that by the mid-1890s he’d obtained his Bachelor of Science in Aerodynamics. Assuming he’s a genius, we can then also assume that when he left Cornell, he went straight into the designing and constructing of flying machines. Now, bearing in mind the enormous interest there was at that time in the possibilities of such machines – and the fact that numerous researchers and inventors were obsessed with the possible theft or plagiarism of their designs – the need for secrecy would certainly have been paramount. Given this, it *is* possible that our Wilson was financed by some stock company in New York to set up a secret aeronautical research complex in the sparsely populated wilds of Illinois or Iowa. It is therefore also possible – still assuming that our Wilson is a genius – that he could have built the first airship by 1896.’

‘Christ!’ Stanford exclaimed. ‘Jesus Christ! Which gets us to your tapes.’

‘Correct,’ Epstein said.

‘What’s on them?’ Stanford asked. ‘Tell me what’s on the tapes. I can’t wait till we get to DC. I have to know *now*!’

Epstein didn’t reply. Stanford turned and looked at him. He just sat there with his head tilted toward one shoulder, his eyes closed, breathing deeply. Stanford smacked him on the shoulder, but Epstein didn’t respond. Stanford cursed and glanced out at the swirling snow and then looked back at Epstein. He was still breathing deeply, his eyes closed as if asleep, and Stanford shook him and received no response and felt a sharp, stabbing panic. He shook Epstein again, loudly called out his name, but Epstein still didn’t wake up. Stanford was confused, not knowing what was going on, thinking Epstein might have had some kind of stroke, wondering what he could do. They were a long way from Washington. The mountains soared behind them. Ahead, on both sides of the road, the hills climbed into darkness. Stanford cursed and stopped the car, twisted sideways, shook Epstein. The latter blinked and then opened his eyes properly and looked vaguely around him.

‘Where are we?’ he asked.

‘Nowhere,’ Stanford said. ‘I had to stop the car to waken you. I was worried that something had happened to you.’

‘I fell asleep?’

‘That’s what it looked like. I just blinked and you were gone. I’ve never seen anyone fall asleep that fast and it gave me a fright.’

Epstein smiled. ‘My apologies.’

‘Are you sure you’re okay?’

‘Of course,’ Epstein said. ‘I feel fine. I don’t know what happened… All the flying… Jet lag.’

‘Can I go now?’ Stanford said.

‘Certainly. Please do.’

‘Good,’ Stanford said. ‘I’m relieved. I don’t like it out here.’

He turned the ignition key. When nothing happened, he tried again. Nothing happened and he cursed and tried a third time, but still nothing happened. He glanced at Epstein, saw his eyes gradually closing. Stanford cursed and then tried the car a fourth time, but still nothing happened. The engine was completely dead. Stanford didn’t understand that. He looked around him, saw the thick, spiraling snow, the hills covered in pine trees. Stanford looked again at Epstein. The old man was asleep. Frightened, Stanford opened his door and slipped out of the car.

The wind was light but icy, Shivering, Stanford went to the front of the car and raised the hood. He beamed his flashlight on the engine, examined the spark plugs, the carbureter, the works, but couldn’t find anything wrong. Stanford shivered with cold. The snow was settling on the engine. He turned the flashlight off and went back around the car to try the ignition again. He bent forward to climb in, stopped, blinked a few times, then saw that the other door was open and that Epstein was missing.

Stanford straightened up quickly, feeling panic, his heart racing, looking over the car, across the road, at the tree-covered slopes. The trees were tall and close together, blocking out the moonlight, the white snow disappearing into darkness where the slope became steep. Then he saw Professor Epstein, stooped over, coat flapping, clambering up the slope and heading through the trees, the snow swirling about him.

Stanford bawled Epstein’s name, but Epstein didn’t glance back. He had passed the first trees, his feet kicking up the snow, disappearing, reappearing, clambering uphill. Stanford looked beyond him. A chill ran down his spine. He saw the light beyond the trees, rising up, spreading out, a glowing fan at the top of the hill, growing larger each second.

‘Oh, my God!’ Stanford whispered.

He hammered the car with his fist, ran around it, followed Epstein, his feet sinking into the snow as he crossed the dark road. The wind was sharp and icy, blowing the snow into his face, and he put his hand over his face until he reached the first trees. Looking up, he saw Epstein… heading determinedly for the pulsating light that fanned out in the black sky.

Then Stanford heard something, thought he *felt* it, wasn't sure. He jerked his head back and looked directly above him and went numb all over. There was no sky above. There was just a total blackness: a blackness that wiped out the moon and stars and was utterly physical. Stanford kept looking up. He couldn't believe what was happening. The blackness went as far as he could see and seemed to be bearing down upon him.

Stanford looked again for Epstein. He saw him moving between the trees, The light fanned out above the brow of the hill, glowing and pulsating. Stanford bawled Epstein's name, but Epstein didn't glance back. Stanford cursed and started hurrying up the hill, the air vibrating around him. He heard the sound or *felt* it, wasn't sure what it was, slowed down and started slipping and sliding, his head tight, his lungs bursting. Then he fell and rolled over, looked up and saw the light, saw Epstein clambering up toward the light with unnatural energy.

Stanford lay there in the snow. He looked up and saw the light spreading out and enveloping Epstein. Then two figures materialized. Both were silhouetted. They came up over the brow of the hill, moving steadily, methodically. They stopped and stood still and were framed by the fan of light. Epstein straightened up and walked up to the figures and one reached out and touched him. Stanford lay there, looking uphill, unable to move. Epstein merged with the two silhouettes and then they all walked away, vanishing over the hill. Stanford lay there for what seemed like a long time, the vibrating sound numbing him.

The snow continued falling. The fan of light started fading. It grew weaker and smaller, shrank to nothing, and then disappeared. Stanford lay there in

the snow, watching the brow of the hill. A line of white lights rose out of the darkness to climb slowly and vertically. Then the vibrating ceased. The dark night was filled with light. Stanford jerked his head back and looked above him and shielded his eyes.

There was light in the blackness, a perfect circle, growing larger, spreading out and hurling down a dazzling radiance that turned the night into daytime. Stanford shielded his eyes. He squinted up at that pool of light. He saw the other line of lights gliding over from the hill and merging with the fierce light above him and then disappearing.

Stanford closed his eyes. They were watering and stinging. He blinked and looked up again and saw the dazzling white light. There was a black disk in the middle. The larger circle of light was shrinking. It kept shrinking until it swallowed the black disk and the blackness was total.

Stanford kept looking up. He saw nothing but the blackness. He lowered his gaze and looked back along the road and saw a ribbon of stars. The blackness ended back there. The ribbon of stars was growing wider. The far edge of the blackness was receding and racing toward him. Stanford looked the other way. He saw the very same thing. He saw a ribbon of stars growing wider as the blackness raced toward him. Then he looked up again. He saw nothing but the blackness. He looked around him and saw the emerging stars as the black mass kept shrinking. It shrank as it ascended. The stars raced in on all sides. Stanford looked up and saw the dwindling darkness with the stars all around it. It finally became a small black disk. The disk shrank and disappeared. Stanford looked up and saw the starry sky, the moon wreathed in clouds.

The tightness left Stanford’s head. He stood up and then walked up the hill until he stood at the top. He looked down the other side, saw a snow-white, empty field. He turned around and stumbled back down to the car, feeling outrage and grief. He turned the ignition key. The car roared back into life. Stanford drove back to Washington, DC, the loss of Epstein tearing at him,

now determined to get the tapes in the safe before he, too, was taken.

CHAPTER TWENTY-EIGHT

February 22, 1945. The guns roared in the distance, the skies were filled with smoke, and we had to destroy the Kugelblitz and make good our escape. I remember it well. I had to wrap myself in ice. The sleek saucer stretched across the broken stones at the base of the mountain. We had removed the new components. We had to leave the rest behind. We couldn't let what remained fall to the enemy, and so we had to destroy it. I stood near the hangar doors. General Kammler was not present. The forested hills of Kahla were all around us and veiled in a thin mist. I glanced at General Nebe. His swarthy face revealed nothing. My fellow scientists and technicians were just behind me, their eyes fixed on the saucer. The guns roared in the distance. The saucer glittered in the sunlight. Nebe's demolition men were standing under it, grouped around the four legs. One of the men waved his hand. General Nebe nodded soundlessly. All the men moved away from the saucer and returned to the hangar.

I no longer accepted pain. It was a redundant emotion. Nonetheless, as I gazed at my great creation, I had to harden myself. The saucer looked enormous, its sloping sides a seamless gray, sweeping up to a steel-plated dome and reflecting the sunlight. It looked very beautiful. It also looked quite unreal. What I felt was a fleeting sense of loss, but I rigorously stifled it. I just stood there, saying nothing. General needed nodded again. A kneeling sergeant leaned forward and pressed a plunger and the saucer exploded.

Fierce flames and swirling smoke. We were crouched behind sandbags. The explosions reverberated throughout the hangar and then faded away. We all stood up slowly. The smoke was billowing toward the sky. Where the saucer

had stood there was a black hole, filled with smoldering debris.

I found myself speechless. I turned away and faced Nebe. His dark eyes and humorless face displayed no sign of sympathy. He just shrugged and surveyed the hangar. It was immense and filled with workers. The workers were lined up against the walls, being guarded by soldiers. Nebe's dark eyes were watchful. He murmured an order to the sergeant. The sergeant barked further orders to this troops and they all raised their weapons. The prisoners moved immediately. They placed their hands on their heads. Silent, their eyes as dead as the moon, they marched out of the hangar.

The destruction began. We would leave little to the Allies. All that day the ground rocked to explosions and the shrieking of bullets. A dark smoke boiled from the hangar. The long tunnels were filled with flames. The technicians stood outside, bemused, as their laboratories crumbled. Soldiers darted to and fro. Hand grenades curved through the air. The flames daggered through the black smoke and splashed down on the ground.

Other guns roared in the distance. The horizon was smokey. The enemy was advancing every minute and our time became precious. We all rushed to pack the trucks. The largest crate was first to leave. In the crate were the numerous new components, without which we'd be lost. I climbed in beside the crate. I glanced out and saw the prisoners. They were kneeling in great numbers on the ground, the smoke drifting around them. I did not look very long. They were destined for Buchenwald. When they turned to smoke and ash in the crematoria, what they knew would die with them. I reached out and touched the crate. General Nebe waved from the murk. The truck growled and then rumbled down the hill as the destruction continued.

Darkness was descending. Allied guns roared in the distance. The truck started rocking from side to side and the large crate swayed dangerously. I reached out and touched it. I thought briefly of Rudolph Schriever. The Flugkapitän was still working in Mahren, racing to finish his saucer. As the guns roared, I smiled. Schriever's saucer would never work. I stroked the

large wooden crate with loving fingers and felt a deep peace. The truck shuddered and then stopped. I heard the hissing of steam. Looking out, I saw the mass of milling workers approaching the train.

We unloaded in darkness. The crate was moved with great care. A battalion of SS troops marched by, their guns and knives gleaming. They were all youthful fanatics. They were General Nebe's disciples. They had deserted after the attempt on Hitler's life and now were going with us. The war raged on in the distance. The train clanged and spat steam. The slave workers were stripped to the waist, sweating under the cracking whips. I watched the crate being loaded. It bumped against the long carriage. I cursed the man who was operating the crane and he lowered his head. The crate was then lowered more carefully. Blackened hands pushed it inside. The doors were closed and the slaves were ordered away as I walked to the platform.

Allied planes growled overhead. I heard the crack of a rifle. A dog snarled and a man started screaming as I reached the dark platform. Clouds of steam swirled around me. Troops were entering the train. The ground shuddered and I saw flames in the distance, flaring up in the black night. Men were shouting and jostling. A torch shone in my face. General Nebe materialized from the murk, his dark eyes unrevealing. He pointed up to the nearest carriage. I saw the peaked caps of the officers. I nodded and we both boarded the train and closed the door hard behind us.

The carriage was packed and noisy. A sweating corporal pulled the blinds down. Once finished, he turned on all the lights and I felt my eyes stinging. Most of the officers were disheveled. Their ties were loose and their shirts were soaked. The air was blue with cigaret smoke, smelt of ash and fresh sweat. General Nebe murmured something. Two men jumped to their feet. They saluted and then marched away, leaving two empty seats. Nebe indicated one of them. When I sat down, he sat beside me. The two officers seated opposite froze visibly and then lowered their eyes. Nebe yawned and glanced around him. His rough face was expressionless. Shortly after, with

much clanging and groaning, the train started moving.

The night was long and miserable. The train stopped and started often. Allied planes growled continuously overhead, the guns boomed in the distance. The officers smoked and played cards. Their ears cocked when they heard explosions. Nebe slept with his mouth pursed and whistling, his head hanging heavily. General Kammler was not present. He was busy elsewhere. That same night he was moving the scientists from Peenemünde to the mine shafts of Bleicherode. He had suggested the move to Himmler. It was a cunning thing to do. Its purpose was to distract Himmler's attention while we made our escape. The Reichsführer was in a panic. He had forgotten about the wilderness. He was now more concerned with the V-2 rockets, and with young Schriever's saucer. The guns roared as I smiled. I thought of Schriever back in Mahren. That fool would still be working on his saucer when the Allies arrived.

We were bombed a few hours later. I remember my annoyance. The sudden roaring almost split my eardrums as I plunged to the floor. The bending tracks shrieked. My one thought was for the crate. The whole carriage rose up and crashed down and then rolled onto its side. The noise was catastrophic. Men screamed as seats buckled. I went sliding along the floor and struck a wall and rolled over a flailing man. Flying pieces of wood and spinning chairs. A smashed head pouring blood. I turned around and saw the windows above me, glass shattered and glinting. Men screamed and bawled curses. I jumped back to my feet. A bloody corporal formed a stirrup with his hands and Nebe planted his boot in it. The corporal heaved the general up. I saw the mass of dangling legs. More bombs fell and exploded around the train as I found a cleared space. I pulled myself up through the window. The night roared and spewed flame. I crawled away from the window and rolled off and crashed down to the ground.

My one thought was for the crate. I ran toward the long carriage. Men were falling off the train and crashing down and then rolling away from me. The

whole scene was chaotic. A silhouette was bawling orders. I clawed two or three men from my path and then saw the long carriage. General Nebe was already there. There were three trucks near the train. A dozen men were laboring under my crate, their backs bent, their necks straining. Another bomb fell nearby. Nebe stepped forward to bark an order. The men heaved the crate onto the truck and then collapsed from the effort. General Nebe's jackboot glistened. He kicked one of the lolling men. The men jumped up and grabbed at their weapons and clambered into the truck. Nebe waved his right hand. I climbed up beside the driver. Nebe followed me in, barked an order, and then the truck began moving. Allied planes passed overhead. A gray dawn was breaking. There was another truck in front, one behind, and we kept moving forward.

The breaking dawn was filled with smoke. The landscape was devastated. Charred trees and smoldering buildings and corpses, ragged columns of refugees. The refugees were going the other way. Allied planes flew overhead. The trucks growled and bumped along the dusty roads as the smoke cleared away. A drab country: anonymous. The devastation remained. The blackened buildings were no longer smoldering: the ash had turned cold. We stopped and started often. Darkness fell and brought a stark, chilling silence that gave way to the murmuring sea.

We stopped just outside Kiel. The fields were flat and barren. I saw a\hangar, a series of low bunkers, a few bleak, concrete buildings. There we stayed for five weeks. The crate was hidden in a bunker. Every day I went down to inspect it, wanting desperately to leave. Each day was the same. The men smoked and played cards. Allied planes rumbled over our heads, but always kept flying south. Long days and freezing nights. I toyed with mathematical riddles. It was wet and the SS men were drawn to the flickering ovens. General Nebe kept to himself. His dark eyes were unrevealing. He slept soundly, his mouth puckered and whistling, his heavy legs outstretched. Dawn drifted into dusk. The Allied planes flew overhead. I often studied the SS men in the bunkers, wondering what they were thinking. They all seemed

to be very young. Most were handsome and sweet-faced. All had dipped their hands in blood and tortured the helpless, few would suffer from sleepless nights. I wondered how we could take them all. I didn't believe we had the space. A cold wind came and chilled us to the bone and Nebe said we were moving out.

We drove down through Kiel. A fine mist veiled the darkness. I was sitting in the back of a truck, the wooden crate towering over me. I thought of Kammler in Oberammergau. I wondered if he had escaped. I thought of Wernher von Braun and Dornberger and wondered what would become of them. Kammler might still be with them. He might be down there in Kiel. I ran my fingers along the length of the crate and then we came to the docks.

The trucks squealed to a halt. The crate shuddered and then was still. General Nebe's dark eyes appeared from dense mist and he motioned me out. I jumped down, feeling stiff. The docks were very quiet. The black water reflected the lamps beaming down on the submarines. I glanced keenly around me. Nebe was murmuring to some troops. The men formed up in a neatly spaced line against the wall of a hangar. Other men were at my crate. They worked slowly and carefully. I glanced down at the submarine just below me: U-977. There were men on the deck. They were grouped around the hold. Chains rattled and I saw my precious crate dangling over the water. There was a moment's hesitation. The crate was jerked and started spinning. Hands reached up and guided it down until it dropped out of sight.

General Kammler appeared on deck. He was accompanied by Captain Schaeffer. Both men climbed up the ladder to the dock and approached General Nebe. Kammler spoke in a low voice. He kept glancing along the dock. His shadow trailed out along the wet stones and smothered my feet. General Nebe turned away. He murmured something to his sergeant. General Kammler took a torch from his pocket and flashed it three times. I glanced along the dock. I saw the lights of another truck. The truck growled and then started toward us, its headlights turned down. General Kammler walked up

to me. He introduced me to Captain Schaeffer. We shook hands as the truck pulled up near us and turned toward the water.

The SS troops were silent. They formed a line along the hangar. The sergeant stepped back and bellowed an order and the troops faced the wall. I heard their weapons rattling. Their boots rang on the stones. The truck stopped, overlooking the water, and then its ramp was thrown down.

A shocking noise split the silence. I shook my head to clear it. The SS troops lined up along the hangar were jerking and wriggling. My eyes turned toward the truck. I saw a barrel spitting flames. The machine gun was roaring and rattling as the men screamed and died. When I blinked, there was silence. A grey smoke drifted lazily. The tall wall of the hangar was filled with holes and splashed with fresh blood. The men all lay on the ground, sprawled across one another. Their large pupils reflected the lamps beaming down on their faces.

Captain Schaeffer turned away. I saw Kammler's tight lips. General Nebe took his pistol from its holster and then cocked the hammer. He nodded to his sergeant. They both approached the bloodied men. Most were silent, but a few were still whimpering, their hands opening and closing. General Nebe fired the first shot. His sergeant fired the second. They took turns, bending over the bodies, their gunshots reverberating. It seemed to take a long time. It did not take long at all. When they had finished, General Nebe turned away and waved his free hand.

Some men jumped out of the truck. The machine gun's barrel clanged. General Nebe returned his pistol to its holster and then walked toward us. There was no sweat on his brow. His dark eyes were unrevealing. He nodded and we all turned away and climbed down to the submarines.

We moved out shortly after. We did not go very far. I stood with Nebe and Kammler on the deck and watched the men on the dock. There were only four men. They worked long and hard. They put the bodies of their dead comrades

in the truck and drove it into the hangar. The dock was very quiet. Its lamps beamed down on the wet stones. More Allied planes rumbled overhead as the four men emerged again. They were not in the truck. They merged gradually with the darkness. They climbed down the steel ladder one by one and dropped into a dinghy. The oars splashed in the water. The distant lamps showed desolation. After what seemed like a very long time the men arrived at the submarine. They were all helped aboard. The dinghy drifted away. I stared back across the water to the dock and saw the lamps on the hangar.

The explosion was catastrophic. The whole hangar disintegrated. The flames shot up in jagged, yellow lines that turned the night into daytime. The noise was demoniac. A black smoke billowed out. The flames swirled and turned into crimson tendrils that embraced one another. Then the smoke drifted sideways, revealing the rubble. Flames leaped across the charred, broken beams and stained the road with shifting shadows. The flames burned a long time. The harsh wind made them dance. They were still burning brightly when we submerged and disappeared in the Baltic Sea.

CHAPTER TWENTY-NINE

EDITED TRANSCRIPT GER/0023/DEC 3 77

TAPED INTERVIEW BETWEEN DR FREDERICK EPSTEIN

& PROFESSOR RONALD MANSFIELD OF THE

GROUPMENT D'ETUDES DES PHENOMENES

AERIENS

LOCATION: PARIS, FRANCE, AS ABOVE

INTERVIEW DATE: NOV 27 77

EPSTEIN EDITED OUT

Tape 1:

Yes, Dr Epstein, it is of course true that we in the British Intelligence Objectives Sub-Committee were particularly interested in German scientific progress during the Second World War. It must be borne in mind that from the moment Hitler took power, in 1933, a gross militarism prevailed and all outstanding German scientists were compelled, despite their personal beliefs, to work on military projects. Now most of that work was concerned with the production of various kinds of advanced weaponry, but as early as 1934 there was talk emerging from Germany about even more disturbing projects, such as aerial torpedoes, pilotless aircraft, remote-controlled rockets, long-range

guns, and mysterious death rays – so quite naturally we worried. Our anxieties were increased when, in 1942, various resistance groups informed us of the flying bombs and giant rockets being constructed at a secret research establishment at Peenemünde; and then we started receiving reports, from experienced pilots, of mysterious ‘fireballs’ that were harassing them on their bombing runs over occupied Europe.

Confirmation that the Peenemünde experiments had been successful came on June 13, 1944, when the first V-1 flying bombs fell on England, and, more forcefully, on September 6 the same year, when the first of the V-2 rockets devastated parts of Chiswick and Epping. Since these fearsome inventions were dropping on London and surrounding areas, the populace was obviously aware of them; however, what the populace did not know – and what we were not about to reveal – was that many Allied pilots had started returning from bombing runs with wild tales of being pursued by mysterious ‘fireballs’ that made their aircraft’s ignition and radar malfunction.

The first recorded incidence came from Lieutenant Edward Schlueter of the 415th US Night Fighter Squadron. Reportedly, on the night of November 23, 1944, Lieutenant Schlueter was flying in a heavy night fighter over the Rhine, about twenty miles from Strasbourg, when he and Air Intelligence Lieutenant Fred Ringwall glanced out of their darkened cockpit and saw ‘ten small balls of reddish fire’ flying in formation at what they claimed was amazing speed. The lights followed the aircraft for some time, were pursued and disappeared, returned and seemingly caused the aircraft’s ignition and radar to malfunction. The ‘balls of fire’ eventually vanished over the Siegfried Line.

Four days later, on the night of November 27, pilots Henry Giblin and Walter Cleary submitted an official report stating that their airplane had been harassed over the vicinity of Speyer by ‘an enormous burning light’ that was flying fifteen hundred feet above their plane at about two hundred and fifty miles per hour and seemingly caused their radar to malfunction. This report

was followed by a sudden spate of similar reports, most of which agreed that the objects were large, bright, orange lights, that they appeared to *ascend* from low altitude, and that when they leveled out and followed the aircraft there were inexplicable ignition and radar malfunctions. Finally, when on January 12, 1945. Several bomber squadrons *simultaneously* reported seeing the lights, we decided to open a dossier on the subject.

Naturally, when the war ended, our major priority was to take under our control as much as possible of the documents, drawings and actual components belonging to Nazi Germany's scientific and military research. Regarding this, the Red Army moved into the enormous underground rocket factory in Nordhausen in the Harz Mountains, where they took charge of almost completed flying bombs and rockets, numerous precision tools and parts, and over three thousand research workers from Pennemünde, including leading scientist Helmut Grottrup and quite a few other rocket experts – all of whom disappeared into the Soviet Union to create God knows what. The Americans, on the other hand, managed to get their hands on over a hundred V-2 rockets, five cases of hidden and highly secret Peenemünde documents and, of course, the very famous Wernher von Braun, a few hundred other V-2 specialists, and another hundred-odd scientists who were intimate with the various Peenemünde projects.

I give you these figures not just to impress upon you the fact that both the Soviets and the Americans gained from this division much of the material, human and otherwise, vital to advanced weaponry research and the exploration of space, but also to impress upon you the sheer *size* of the German projects.

And the British? It was our intention right from the start – as it was doubtless the intention of the Soviets and the Americans – to complete the picture on the state of development of German research on guided missiles, supersonic aircraft and other secret weapons. Apropos of this, we sent teams of specialists belonging to the Ministry of Aircraft Production all over western

Germany and Austria, their brief being to locate every cave, disused mine, tunnel, ravine or forest where secret German establishments might be hidden and, once having located them, to dismantle and return to England the most valuable or enigmatic equipment, even including the Germans' quite extraordinary wind tunnels.

Since the British zone of occupation extended from the Dutch frontier to Prussia, centering on the invaluable port of Hamburg and including a large part of the eastern Alpine massif in Austria, we really did quite well out of the deal. The movement of this mass of captured documents and equipment was discreetly controlled by the British Intelligence Objectives Sub-Committee, and in general it was transported to Hamburg, shipped from there to England, and from there distributed to various interested parties such as the experimental center then being built at Bedford, the Royal Radar Establishment at Great Malvern, the Telecommunications Research Establishment, and other top-secret establishments in Canada and Australia.

Working under British Intelligence, my job was to organize the Anglo-Canadian teams of scientists who would scrutinize every aspect of the captured German technology. Our main concern was with unraveling the mystery of certain German secret weapons that may, or may not, have existed. These would have included the Foo Fighter or 'ball of fire' that reportedly harassed so many Allied pilots; the 'circular German fighter without wings or rudder' which, according to one reliable source, crossed the flight path of a four-engined Liberator at very high speed, gave off a number of little 'bluish' clouds of smoke, and caused the Liberator to catch fire and eventually exploded; and the 'strange flying machine, hemispherical or circular in shape' that reportedly flew at incredible speed, attacked a whole convoy of twelve US night fighters, and destroyed them without using visible weapons. Naturally, being British, we approached our task with a certain skepticism – but such skepticism would shortly be dispelled and replaced with amazement.

Let me briefly summarize what we found. First, whether or not the mysterious aircraft that sprayed those bluish clouds of smoke over the unfortunate Liberator was ‘a circular German fighter without wings or rudder’, it certainly could have caused that aircraft to explode without using its guns. We came to this conclusion when we discovered that documents recovered from the technical departments of factories hidden in the densely forested areas of the Schwarzwald contained details of experiments conducted with a liquid gas that would, when blown with considerable force over an aircraft, catch fire from the aircraft’s exhaust fumes and cause the aircraft to explode. The existence of this gas was confirmed by one Dr Rosenstein, an organic chemist and Jewish collaborator who, when interrogated by members of the American Aslos Mission in Paris in 1944, stated that the Germans had succeeded in perfecting a new gas whose use would have caused ‘strong vibrations and even breakage in aircraft engines’ by encouraging immediate and repeated self-ignition.

In this context, it is worth noting that in April 1945, on the outskirts of the Hillersleben testing grounds west of Berlin, members of the Intelligence Technical Branch of the 12th Army Group found the rusty remains of a rather odd item called the *Windkanone* – a cannon that shot gas instead of shells – and another odd item called the *Wirbelringkanone*, or whirlwind annular vortex cannon, which was designed to shoot, and then ignite, a gas ring that would spin rapidly on its own axis and form a rather fierce ‘ball of fire’.

Regarding the possibility that the ‘circular German plane without wings or rudder’ might have been some kind of remote-controlled flying device, we discovered that as far back as 1939 Dr Fernseh of Berlin, in collaboration with Professor Herbert Wagner of the Henschel Aircraft Company, was working on the development of a television component that would enable pilots to control bombs and rocket bombs *after* they had been launched; that Fernseh was also involved in the development of a microtelevision camera that would be installed in the nose of an antiaircraft rocket and guide it precisely to its target; and that similar projects were quite commonplace in

Nazi Germany – and, more importantly, highly successful.

Naturally, such information led us back into an investigation of the apparently remote-controlled German ‘fireballs’. What we found was that Messerschmitt had developed two workable radio-controlled interceptor planes, the *Krache* and the *Donner*, that these were initially designed to be controlled from the ground by a television receiver installed in an armored console, but that certain negative aspects to the system led to the development of numerous highly advanced electromagnetic, electroacoustical and photoelectric fuses, and to even more advanced warheads that were sensitive to the natural electrostatic fields that surround aircraft in flight. Indeed, some of those devices were incorporated into ‘automatic’ aircraft weapons, with the result that all a German pilot had to do was flying his plane a few hundred yards beneath or above his target and the automatic firing mechanism would operate. Thus, by installing similar devices in a pilotless interceptor rocket, the Germans could engage in aerial combat without using pilots.

The devices I’ve just mentioned led inevitably to a more solid version of the original ‘wind-cannon’ idea. By 1945 a Luftwaffe experimental center in Oberammergau in Bavaria had completed its research into an apparatus capable of short-circuiting the ignition system of an aircraft’s engine at a distance of about a hundred feet by producing an intense electrical field. Their intention – aborted by the ending of the war – was to expand the field greatly, but certainly, by the middle of 1944, they had incorporated the device into a weapon actually called the *Feuerball*, or ‘fireball’.

The *Feuerball* was first constructed at the aeronautical factory at Wiener Neustadt. Basically, it was an armored, disk-shaped object, powered by a special turbojet engine, which was radio-controlled at the moment of take-off, but then, attracted by the enemy aircraft’s exhaust fumes, automatically followed that aircraft, automatically avoided colliding with it, and automatically short-circuited the aircraft’s radar and ignition systems. During

the day this device looked exactly like ‘a shining disk spinning on its axis’ – which may account for the first Allied newspaper reports of ‘silver balls’ observed in the skies over Germany – and by night it looked like a ‘burning globe’. The ‘burning globe’ was actually a fiery halo around the solid device, caused by the very rich chemical mixture that over-ionized the atmosphere in the vicinity of the target and thus subjected it to extremely damaging electromagnetic impulses. It is also worth noting – with regard to the fact that the *Feuerballs* reportedly flew away when attacked – that under the armored plating of the *Feuerball* was a thin sheet of aluminum that acted as a defensive ‘switch’; a bullet piercing the armored plating would automatically establish contact with the switch, trip a maximum acceleration device, and cause the *Feuerball* to fly vertically out of range of enemy gunfire. In short: the *Feuerball* really existed, it was described accurately by our pilots, and it was used with great effect from about November 1944 to the end of the war.

At this point I feel I should remind that from as far back as 1942 the German military establishment had encouraged every kind of research and experiment in the field of jet propulsion and advanced remote-control systems. However, after the attempted assassination of Hitler on July 20, 1944, Hitler in a bout of vengeful fury, turned control of the planning and construction of these astonishing new weapons over to Himmler’s dreaded SS. I mention this because the SS were, by that stage of the war, a self-ruling and highly secretive body with their own research centers and construction plants and factories, many of which even Hitler didn’t know about. In other words, from that point on the fate of many of the secret weapons was even more difficult to trace – and indeed, in many cases is not known even to this day.

What we *do* know is that many of the leading scientific establishments were evacuated totally and transferred to vast underground complexes scattered all over Germany, most notably in the area of the aborted Alpine redoubt. Once transferred, they were virtually sealed off from the outer world, rigidly controlled by the SS, and forced to concentrate their attention on nothing other than advanced military projects. Given that this work went on twenty-

four hours a day, that even the scientists worked in shifts, and that thousands of slave workers from the concentration camps were at their disposal, there can be little doubt that some extraordinary advances were made in those secret research plants.

Unfortunately the SS, when retreating from the Allies, destroyed much of this remarkable research. Unfortunate because what we often found were highly advanced but frustratingly incomplete documents, isolated parts of obviously complex components, and a wealth of other odds and ends that could have belonged to just about anything. Even more disturbing was the fact that thousands of slave workers who had been used in such establishments had, with their SS overlords, simply disappeared by the time we arrived there – and few of them were ever located again.

So, my evaluations are incomplete. Nevertheless, regarding the ’wingless’ aircraft so often reported, we did collect enough material to tantalize us and keep us involved for years. Found across the length and breadth of Nazi Germany were not only the V-1 flying bombs and V-2 rockets, the gas cannons and *Feuerballs*, and the extraordinary variety of automatic flying devices and infrared warheads, but also a considerable number of highly advanced U-XX1 and U-XXIII submarines, almost completed ME-262 jet fighters, a nearly completed atom-bomb project, the prototypes for various vertical-rising aircraft, and even, in the immense underground Riva del Garda research complex, the manufacturing process for a metallic material that could withstand temperatures of about one thousand degrees Centigrade. So, as you can imagine, the Germans were on the verge of some truly remarkable developments.

Tape 2:

There are two problems standing in the way of a supersonic, completely circular aircraft: one is the need for gyroscopic stabilization and the other is control of the boundary layer. It is therefore worth noting that scientists of the Kreiselgerate at Berlin Britz had, in 1943, worked on the construction of

mechanisms employing gyroscopic phenomenon and succeeded in reducing the oscillations of a violently shaken body to under a tenth of a degree. This was, of course, a most important achievement – and added to control of Prandt's 'boundary layer' it would have led to some extraordinary advances in aerodynamics.

Let me briefly explain this 'boundary layer'. While being four or five times less viscous than oil, air *is*, nonetheless, viscous. Because of this, the air sweeping in on the solid body of an aircraft forms imperceptible stratifications of resistance and consequently decreases the speed of the body in flight. These layers of air are known as the 'boundary layer' – and the boundary layer increases its resistance in direct proportion to the increasing speed of the flying object.

In layman's terms, therefore, the major problem regarding supersonic flight was to somehow or other move this negative air as far to the rear of the aircraft as possible, thus minimizing the expenditure of energy required to propel the aircraft through the sky. Further: it is possible that a revolutionary type of aircraft could – by not only *completely* removing the boundary layer, but by somehow re-routing it and utilizing it as an added propulsive force – fly through the skies using little other than the expelled air itself. Should this be accomplished we would have an aircraft capable of remarkable speeds while utilizing the barest minimum of fuel.

By 1945 – or so our captured German papers indicated – both the LFA at Volkenrode and the research center at Guidonia were working on a revolutionary new type of aircraft that was devoid of all obstructing protuberances, such as wings and rudders, was devoid even of the normal air intakes, and was powered by a highly advanced turbine engine. In short, the new aircraft was a 'flying wing' that offered the least possible air resistance, sucked in the 'dead air' of the boundary layer, and then used that same air, expelling it at great force, to increase its momentum.

Whether or not that aircraft was actually developed and flown is not known.

What we did know, however, was that the *Feuerball* really existed, that it took the form of a circular ‘wing’, that the wing was in a sense wrapped around the suction pump, and that the pump was part and parcel of the engine. In other words, the *Feuerball* was a perfectly symmetrical disk, devoid of all surface protuberances – the first small flying saucer.

Nevertheless, with the *Feuerball* the boundary layer would still have been present, albeit drastically reduced. In order to get rid of the boundary layer completely – and in order to make use of the ‘dead air’ not only for acceleration but for maneuvering as well – what was required was a porous metal that would act like a sponge and remove the need for air intakes altogether. This need led scientists into the exploration of what would henceforth be called, in the words of the German engineer Schrenk, ‘frictionless air flow’ and which would result, according to Sir Ben Lockspeiser, in an aircraft that would ‘slip through the air in the same way as a piece of wet soap slips through the fingers.’ I mention this because certain documents discovered by us in both Gottingen and Volkenrode indicated that between 1943 and 1944 the German scientists had been completing their research on just such a metal – a compound of magnesium and aluminum – and had given the resultant material the name of *Luftschwamm,* which translated means ‘aero-sponge’.

Let us assume, then, that by early 1945 the Germans had combined all the aforementioned discoveries into one complex experimental flying machine. First, we have a small flying disk known as the *Feuerball*. This disk not only spins around its vertical axis, but automatically follows its target, makes its target’s ignition and radar malfunction by filling the vicinity with a gas that when burning creates a damaging magnetic field, then automatically flies away when attacked.

Now let us enlarge this flying ‘fireball’. The new, enlarged disk will also spin on its vertical axis, but with the addition of direct gyroscopic stabilization, a pilot’s cabin can now be placed on that axis, with the main body – or engine

– of the disk spinning around the cabin. We then add to the enlarged, pilot-carrying disk a form of radio that can cancel at the pilot's discretion the return signals, or blips, from the enemy's radarscope and thus render our flying disk undetectable to the enemy. Next, we have electromagnetically or electroacoustically controlled firing weapons, we have cannons that spit ignition-damaging gas instead of shells, we possibly have various laser or pulse-beam weapons, and we have devices that insure that our flying disk will automatically retreat from enemy attacks. Add to all this the fact that the disk is made of an alloy that can withstand enormous pressure and a temperature of one thousand degrees Centigrade and that, being porous, can take the air in like a sponge and then use it to enhance its own propulsion to almost unbelievable speeds… Add it up and what do we have? What we *might* have is the German *Kugelblitz*, an offspring of the *Feuerball*, a piloted machine in which a single mass of wing, tail and fuselage is formed into one gyroscopically stabilized, vertical-rising, possibly supersonic flying disk.

Did such a machine exist? I think it might have. What I *do* know is that a machine very much like it, and called the *Kugelblitz*, was reportedly test-flown sometime in February 1945, in the area of the underground complex at Kahla, in Thuringia, that the test was marked as successful, and that from incomplete notes found in the Kahla complex when the Allies took it over, that machine reached a height of about forty thousand feet at a speed of approximately twelve hundred and fifty miles per hour.

Regarding the possibility that what we found in Germany was later utilized by the Allies, I can only point out that shortly after the war the British and the Canadians between them began to develop some revolutionary kinds of aircraft that were rumored to be based on designs discovered in Germany after its collapse. Included in these were the Armstrong Whitworth Aircraft Company's AW-52-G all-wing glider and the AW-52 Boomerang – both of which were similar in appearance to the German 'flying wing' designs and, incidentally, to the enormous 'flying wing' seen over Albuquerque in 1951. Also, during that same period, there was much talk in British and Canadian

aeronautical circles about research into ‘porous’ metals and vertical take-off jet planes – and, of course, there were a remarkable number of UFO sightings. Finally, as you yourself have reminded me, both the Americans and the Canadians made numerous mentions of official flying saucer projects. From all this, Dr Epstein, I think you can draw your own conclusions.

CHAPTER THIRTY

The noon sun was scorching, the humidity suffocating. The river rippled and flashed, curving away in the distance, shadowed by the conifer trees and the banks of reddish mud as the sun beat down on the forests, on the creaking gunboat, draining Stanford and making his eyes sting as he clung to the railing. He could scarcely grasp where he was, had lost track since his arrival, stunned by the heat, by the stifling humidity, alienated by the noise and dusty streets of Asunción, now gazing across the Paraguay River and wondering where he was going. Stanford normally enjoyed the heat, had grown up with it, was used to it, but here, on the gunboat, the forests looming across the river, the heat was unearthly, unreal, totally monstrous, a sodden heat that clamped all around him and threatened to choke him. Stanford took off his hat, wiped the sweat from his forehead, put the hat back on and glanced about him, his clothes soaked, his boots burning.

‘Have a beer,’ *Señor* Stanford. It will help cool you down. You must not let the sun dehydrate you. You need plenty of liquid.’

Juan Chavez was smiling, a sly, gap-toothed grimace, his dark eyes as unrevealing as the forests slipping past the gunboat. Stanford nodded and took the beer, the bottle cold in his sweaty hand. He drank and wiped some foam from his lips, stared uneasily at Chavez.

‘How much longer?’ he asked.

‘Not long, *señor*.’ Chavez grinned and the spat over the railing, his open shirt fluttering.

‘*How* long?’ Stanford asked.

‘Not long,’ Chavez repeated. ‘Five, maybe ten or fifteen minutes. It is just around the bend in the river. It will not take much longer.’

Stanford gazed along the river, saw it curving around the line of trees, flowing lazily, rippling out around rocks, slashed by sunlight and shadow. The sight of it chilled him, made him feel more unreal, filled with foreboding and with vague, nameless fears that lanced through him for no apparent reason and drained him of courage. He despised himself for it, tried to fight it, failed repeatedly, tumbled back into fear and confusion like a child having bad dreams. In a sense that’s what it was – he recent recollections were all nightmarish: the strange ‘boys’ outside the ranch, the ‘suicide’ of Scaduto, Epstein willingly clambering up the darkened hill and not seen since that evening. Stanford felt crushed by it all, dogged by incomprehension, dreaming frequently of the lights that pulsated and merged, and then awakening to an alien world in which nothing was constant… And now here he was in Paraguay, the sun blinding him, the heat draining him. He had been on the shuddering gunboat for four or five hours, passing banks of reddish mud and sleazy waterfront cafés and dense forests that soared on either side and seemed to be totally impenetrable. Stanford coughed into his fist, trying to clear his dry throat, raised the bottle to his lips and drank some more, seeking some kind of solace.

‘Good,’ Chavez said. ‘You must drink. You must never dehydrate.’ He was eating from a cone of paper, dipping into it with his fingers, and he grinned and held the cone out to Stanford, his brown eyes faintly mischievous. ‘Here, *señor*,’ he said. ‘You must eat as well as drink. You should have some *camarónes*.’

Stanford fought back his revulsion. ‘No, thanks,’ he said. ‘I can just about stomach this beer. I don’t think I can eat.’

‘You are feeling ill, *señor*?’

‘Not really,’ Stanford said.

‘Ah, yes,’ Chavez said. ‘This stinking boat. And the heat… You’re not used to it.’

Stanford didn’t reply. He gazed around the crowded gunboat. The Ache Indians were still crouching at the aft end of the desk, small, emaciated, their narrow eyes dulled by dread, dressed in rags and huddling close to one another as if for protection. Two *Federales* were guarding them, wearing jackboots, holding rifles, both gaunt-faced and bored, chewing gum, their mean eyes hooded beneath peaked caps. Stanford studied them at length, feeling helpless and ashamed, recalling how the Ache Indians had been herded onto the boat after being abducted from a village some miles back. They were being sold into slavery. They would end up in Bolivian tin mines, in the ranches of Boqueron, in the brothels of Argentina and Brazil, in the cotton fields of Guatemala. Stanford felt shame when he thought of it. The eyes of the women and children haunted him. He turned away and gazed along the muddy river, drinking his beer, soaked in sweat.

‘This is your first time in Parguay, *Señor* Stanford?’

‘Yes,’ Stanford said.

‘You must get used to these things,’ Chavez said. ‘You must not be upset by them.’

‘I won’t get used to them,’ Stanford replied. ‘I won’t be staying here long enough. Once I speak with the German I’m leaving. I won’t get used to anything.’

‘You disapprove,’ Chavez said.

‘That’s right: I disapprove.’

‘Disapproval is a luxury,’ Chavez said. ‘An American luxury.’ He grinned

and glanced about him, his jaws working on *camarónes,* drank some beer and then looked back at Stanford, his brown eyes still mischievous. ‘You know the German?’ he asked.

‘No,’ Stanford said.

‘It is very strange, *señor,*’ Chavez said, ‘that you should know he is here.’

‘Why strange?’ Stanford asked.

‘The German doesn’t have many friends. He has been here in the forest for thirty years and is a man of great mystery.’

‘That’s not unusual,’ Stanford said. ‘There are a lot of Germans here. They own and operate the *estancias* and are all well protected.’

Chavez grinned broadly. ‘You do us wrong, *señor*. These rumors about us harboring Nazis have no basis in fact.’

‘Really?’

‘Really.’

‘Bullshit,’ Stanford said. ‘Your whole economy is based on slavery and drugs – and on harboring Nazis.’

‘Lower your voice, *señor*.’ Chavez’s eyes flicked left and right. ‘It is not wise to speak of such things in so open a manner.’

‘I’m an American,’ Stanford said.

‘That wouldn’t help you, *señor*. The *Federales* are devoted to General Stroessner and would not make allowances.’

Stanford glanced past Chavez and saw the lounging *Federales*, most of them lingering around the rusty gunmounts, chewing gum, smoking cigarets.

Stanford didn't like the look of them. They looked simple-minded and brutal. They had Kalashnikov rifles slung across their shoulders, and their jackboots, which were covered in mud, made him think of the Nazis.

'Okay,' Stanford said. 'What's *your* connection to the German? Note: I didn't call him a Nazi. I'm a very good tourist.'

Chavez grinned and shrugged. 'The Ache,' he said. 'I round up the Ache and deliver them to the German, and he gives me a percentage of what he makes on the ones that he sells on.'

'And what happens to the ones he *doesn't* sell?'

Chavez grinned again. 'At our worst, we are patriotic. The Ache are vermin, filthy and diseased; they cannot look after themselves and they cause us much trouble. So, if they cannot be sold, we look after them in other ways…'

'You exterminate them,' Stanford said.

'A harsh word, *señor*. Let's say we put them out of their misery and leave it at that.'

Stanford finished his beer, threw the bottle overboard, watching it glinting as it bobbed briefly in the river before finally sinking. He glanced again at the Indians, huddled pathetically on the deck. He tried to reconcile this world with the one he had come from: with the pilots and astronauts and the control towers of NASA, with the jet planes and the space probes and the orbiting satellites, with the UFOs that haunted man's thoughts and mapped out his future. He couldn't reconcile the two. This river carried him through history. The gunboat and the forest, the *Federales* and the Indians, all existed in a primitive, frozen past far removed from the modern world. But what *was* the modern world? It was what he had come from. It was a world of technology, of relentless, searching science, racing blindly into a future not yet even imagined, a future in which men would be numbers and facts would rule

feelings. Yet was that such a bad thing? Stanford felt sure that it was. He looked at the squatting Indians, saw them bought and sold as meat, and then wondered if the future conjured up by the man called Wilson would in any sense be better than this: less cruel, more just. No, it would not be. The human lot would not improve. The cruelty and injustice and inequality would remain, changed only in their areas of distribution and in who would most suffer. The advances of science ignored this fact. The two worlds were all too similar. The future being created by Wilson, and represented by his technology, was as cruel and emotionally primitive as the world this gunboat was moving through.

Stanford shivered and looked ahead. The river curved out of sight. He saw a jetty thrusting out from the riverbank, the water rippling around it.

‘There it is,’ Chavez said. ‘Your journey is ended, *señor*. You will soon feel the ground beneath your feet – and can talk with your German friend.’

‘He’s not a friend,’ Stanford said.

‘My apologies, *señor*. A man like you would not have such friends. Your appearance confirms this fact.’

Stanford ignored the sarcasm, his eyes fixed on the wooden jetty, watching intently as the boat approached and the waterside village slid into view, thrusting out from the tangled reeds and liana at the edge of the forest. There were people on the jetty, men in filthy fatigues, looking suspiciously like *contrabandistas*, pistols stuck through their belts. The boat growled and shuddered, turning in toward the village, inched forward and then bounced against the tires along the jetty’s walkway. Stanford glanced back over his shoulder. One of the Ache women was wailing. A *Federale* slapped her brutally on the face and bawled a stream of abuse. The woman’s wailing became a whimpering. Stanford flushed and turned away. One of the crew had thrown a rope to a man on the jetty and this man was tying the rope around an upright, bending low, shouting something. The boat’s engine cut

out. A few member removed the gate. A plank was thrown across the space between the deck and the jetty's walkway, then tied to some flaking uprights to form a crude gangplank. Stanford moved toward the plank, wanting desperately to disembark, but Chavez tugged at the sleeve of his shirt and motioned him back.

'No,' he said. 'First the Ache.'

Stanford stopped and stared at him, saw the sly, gap-toothed grin, stepped back as Chavez went to the *Federales* and bawled his instructions. The *Federales* were quick to move, venting their boredom on the miserable Indians, screaming abuse and kicking them to their feet and herding them toward the makeshift gangplank. The Indians were not so quick, weak from hunger, confused, and the *Federales* encouraged them along with vicious blows from their rifles. The women wailed and hugged their children, cowering away from the rifle butts, while their menfolk, uncommonly small and frail, tried in vain to protect them. Stanford had to stifle his rage, turning away and surveying the gangplank; he saw the first of the Indians stumbling across it with their hands on their heads. Chavez was leading them down, his shirt unbuttoned and flapping loosely, his broad hat tilted over his eyes, keeping off the fierce sunlight. Stanford burned and looked away. He let his gaze roam over the village, a drab collection of leaning huts made from palmetto trunks and vines, hogs and goats sniffing lethargically at the dust, babies lying on corn shucks. The poverty was total, the old and young emaciated, sunlight falling on scattered gourds and woven baskets and banana leaves, on the giant rat that raced across the clearing and disappeared into the forest. Stanford glanced along the jetty. The last of the Ache had just stepped off it. They were now at the edge of the clearing, the *Federales* surrounding them. Chavez waved both his hands. He was signalling to Stanford. Stanford choked back his rage and crossed the gangplank, glanced down once at the muddy, oil-slicked water, then stepped onto the jetty.

One of the nearby men approached him, a big man, broad and muscular, a

pistol stuck behind his belt, a knife bouncing against his hip, his shirt open to expose a hairy chest, his trousers tattered and greasy.

‘The *Americano*?’ he asked.

‘Yes,’ Stanford said.

‘You speak Spanish?’

‘No,’ Stanford said.

‘Okay. Come with me.’

‘You’re from the German?’ Stanford asked.

‘You have no luggage, *señor*.’

‘I don’t intend staying,’ Stanford said. ‘All I need is in here.’

Stanford indicated his shoulder bag. The big man just stared at him. He had narrow eyes and juicily fat lips and his head had been shaved.

‘Okay,’ he said. ‘I see. Come with me.’

‘You’re from the German?’

‘Yes.’

‘Where is he?’

‘Over there.’ The man pointed impatiently at the village. ‘Let’s go. He expects you.’

They made their way along the jetty, past the staring *contrabandistas*, the air stinking of urine and sewage and diesel fuel, the sun glinting off the oil in the river, off pistols and knives. Stanford took note of the weapons, could

scarcely credit the sheer amount of them, had the feeling that he was in a war zone, death ready to pounce on him. This thought heightened his tension, swelled his feeling of unreality, and he blinked and wiped more sweat from his face, tried to keep his head clear. The big man was just ahead, the knife bouncing against his hip, stepping down into the dust of the clearing, chickens scattering around him. Stanford followed him down, feeling drained and exhausted, breathing dust, the heat burning his exposed skin, the light hurting his eyes.

There were two trucks in the clearing, their paint flaking, revealing rust, and the Ache Indians were now grouped just in front of them, being prodded and poked. The Indians were being examined. The *Federales* were watching them. A tall man in gray slacks and white shirt was walking to and fro, studying them. This man was very thin, almost cadaverous, brown eyes in a sunburnt brown face, brown hair graying and thinning. He did not touch the Indians, merely studied them with distaste, standing back while Chavez extolled their virtues, showed their teeth, stripped their clothes off.

'*Quatsch*!' the tall man sneered. 'This is rubbish you bring me. Old men and sick women and children, not worth ten *guaranis*.'

Chavez spluttered his protestations, his hands waving histrionically, then he stripped the blouse off a woman's shoulders and held her breasts high. The woman's narrow eyes widened, filled with fear and dreadful shame, when Chavez jiggled her breasts in his hands as if bouncing two rubber balls.

'Look, *señor*,' he said. 'They are ripe and filled with milk. Still a good breeder, *señor*. And so soft, *señor*. Soft!'

'*Dreck*!' the tall man sneered. 'They are unclean and diseased. They are not fit to work in the fields. You should bury them now.'

Looking at the Indians, Stanford saw their humiliation. He shook with fury and then studied the tall man and wanted to murder him. Chavez glanced

over his shoulder, saw Stanford, grinned slyly, then pointed in Stanford's direction and whispered to the tall man. Stanford stepped forward. The tall man came toward him. They stopped about a foot from one another, the dust drifting between them.

'You are Stanford,' the tall man said.

'Yes,' Stanford said.

'You have the money?'

'I have half the money. The rest is in Asunción.'

'You don't trust me,' the German said.

'I can't afford to,' Stanford said.

'Good,' the German said. 'That is intelligent. I cannot deal with fools.' He grinned bleakly and turned aside, looked at Chavez, waved at the trucks. 'All right,' he said, 'I have no choice but to accept them. Put the *schweine* into the trucks and drive them out of my sight.'

Stanford was enraged, but knew he had to control himself. There was nothing he could do for the Indians; not now and not ever. Still, it made him burn. He heard the bawling and saw the blows. The *Federales* punched the Indians, thumped them brutally with their rifle butts, forcing them up into the rear of the trucks, the women and children all wailing. The tall German hardly saw this. He was negotiating with Chavez. Their hands were waving and they were shouting at each other and then they reached an agreement. They actually shook hands. Stanford thought that ridiculous: a travesty of civilized behaviour. The trucks roared into life and churned up the reddish dust and rumbled out of the clearing. Stanford glanced around the village. The huts were primitive and filthy. Hogs and goats wandered freely, infants sucked at sagging breasts, Indians squatted around fires of glowing ash, staring at him with dulled eyes. Chavez waved at the tall German. He then walked up to

Stanford. He stopped to offer his sly, gap-toothed grin, his brown eyes still mischievous.

‘Keep your eyes and ears open,’ he whispered. ‘Adios, *compañero*!’

He sauntered back to the gunboat, his shirttails flapping behind him, as the German walked up to Stanford, his gaunt face dark and sweaty.

‘So,’ he said, ‘you came.’

‘Yes,’ Stanford said, ‘I came.’

‘And how do you like Paraguay?’

‘I’m not wildly impressed.’

The German laughed at the remark, a high-pitched, barking sound, then the laughter turned into a ragged coughing that made his whole body shake. He cursed and turned aside, covered his mouth with a handkerchief, kept it there until the coughing had subsided, then wiped blood from his lips.

‘*Scheisse*,’ he hissed dramatically. ‘This filthy forest is killing me. I must return to Europe as soon as possible for some civilized care.’

‘Germany?’

‘Where else? I need a competent doctor. The Paraguayans have the surgical skills of butchers. I would not let them touch me.’

‘I thought you liked it here,’ Stanford said. ‘I mean, you’ve been here for about thirty years.’

‘Not by choice,’ the German said. ‘As you well know. I do not require your sarcasm.’

He stared steadily at Stanford, his dark eyes hard and searching, then he

sniffed and turned his gaze on the large man who had brought Stanford to him. The large man moved forward slightly, his knife and pistol flashing, and stopped when he was right beside Stanford, his thick arms dangling loosely.

‘This is Atilio,’ the German said. ‘He’s from Argentinia. He is now what we call a *cuchillero*, and is very reliable.’

‘What’s a *cuchillero*?’ Stanford asked.

‘A knifer,’ the German said. He turned his head and glanced around him, his lips curling in visible distaste at sight of the village. ‘*Diese Halunken*,’ he hissed. ‘Unbelievable. Come. Let us go.’

He led them across the clearing, scattering children and chickens, Atilio right behind him, Stanford just behind Atilio, their feet kicking up the reddish dust, the fires smouldering on all sides. The fires were not for warmth. The Indians were roasting sweet potatoes. The German glanced down and spat on a fire as he passed the drab huts. He stopped at the edge of the forest. The trees shadowed a parked jeep. The German took a back seat, Stanford clambered in beside him, then Atilio sat behind the steering wheel and turned on the ignition.

‘Where are we going?’ Stanford asked.

‘To my compound,’ the German said. ‘You want information and shall have it, but I must have my comforts. It is not too far away. Ten kilometers from here. I feel safer when I’m deep in the forest where the planes cannot see me.’

The jeep roared into life, churning up soil and stones, lurched forward and headed into the forest where the trees kept the sun out. Stanford expected it to be cooler, was shocked to find that it wasn’t: the humidity was much worse, overpowering him, making him feel suffocated. He glanced around him, seeing a riot of vegetation, tangled vines and soaring trees in a chattering

green gloom, isolated shafts of sunlight beaming down on the steaming banana leaves. The narrow track was very rough, hacked out by hand and pitted with potholes, winding left and right between the trees and disappearing ahead of them. The tall German said nothing. Stanford glanced sideways at him. The German skeletal, his cheekbones too prominent, his gelid eyes buried deep in his head, his lips thin and disdainful. The jeep coughed and rattled, bouncing up and down a lot, going through the shafts of sunlight that bored down through the trees and illuminated the steaming vegetation. Stanford felt suffocated. He was sweating and feeling feverish. He glanced again at the German, saw his dark, remote eyes, took a deep breath and licked his parched lips and wished the journey would end.

‘So,’ the German said. ‘You want to know about the saucers. You have come a long way for your information. You must want it badly.’

‘I brought the money,’ Stanford said. ‘I want it that much.’

‘Why?’ the German said. ‘Why this interest in the saucers? Everyone wants to know about the saucers, but it does them no good.’

‘You’ve had others?’

‘Of course,’ the German said. ‘Did you think you were the first to locate me? Such vanity, *mein Herr*!’

The German laughed at his own joke, the same high-pitched, barking sound, and again the laughter turned into a coughing that made him split blood. He cursed and wiped his lips, shook his head and muttered something, his thin body being jolted by the jeep as it bounced over the rough ground of the forest.

‘How many others?’ Stanford asked.

‘Just a few,’ the German said. ‘Three or four over the past ten years or so – all wanting the same thing.’

‘Who were they?’ Stanford asked.

‘Men like you,’ the German said. ‘Men with a great need to know, two Americans, a Russian…’ The German coughed again and cursed softly. ‘It will do you no good,’ he said. ‘Those who know what I know will not admit that it’s true; those who don’t know would refuse to believe it… It will do you no good.’

Stanford didn’t reply. He thought the German might be right. He looked around the forest, at the steaming vegetation, saw striations of light in the gloom and felt as if he were dreaming. Then the jeep burst into sunlight: into a clearing in the forest. Lines of barbed wire formed a fence around a large wooden building, its sloping roof covered in vines and banana leaves, supported by planed tree trunks. The jeep skidded to a halt. Clouds of dust swirled up around it. Stanford coughed and covered his eyes with his hands until the dust had settled down again.

‘*Sehr gut*,’ the German said. ‘We are home. I live humbly, *mein freund*.’

Stanford followed the German down, the dust settling around his feet, the heat monstrous, pouring down upon the clearing as if through a huge sheet of glass. He rubbed his eyes and checked the clearing, saw the curved line of the trees, the large, L-shaped building, a wooden house, directly in front of him, surrounded by more barbed wire. The compound was busy, filled with Indians and *cuchilleros*, the latter keeping watch on the former, their guns and knives threatening.

‘The barbed wire is electrified,’ the German said, ‘so make sure you don’t touch it. Over here. Come this way.’

They walked across a stretch of ground, past the Indians and *cuchilleros*, reached the house and climbed a few wood steps to a porch protected by a thatched awning. There was a table and some chairs. An Ache woman stood by the table. She was wearing a red blouse and long black skirt, a towel

draped over her right arm. She bowed low to the German. He simply grunted and sat down. He waved languidly at Stanford who joined him at the table, which held a bottle of brandy and two glasses, a clay cup full of wriggling worms. The worms were white and fat. The German reached over and picked one up. He bit its head off and held it up and said, '*Koro* worms! Try one.' Stanford shuddered and shook his head, saying, 'No.' The German chortled and swallowed the worm. He put his feet up on a stool and the Ache woman went down on her knees and laboriously pulled off both his boots and wiped his bare feet with the towel. When this was done, she moved backward. She did not get off her knees. The German barked a command and the woman stood up and filled the two glasses with brandy. Stanford watched her, saying nothing. The German clapped his hands. The woman bowed and disappeared inside the house, her bare feet making squelching sounds.

'So,' the German said, 'we are home. We are relaxed. We can talk.'

He picked up his glass, sipped some brandy, set the glass down, stared at Stanford with a humorless smile that made Stanford's flesh creep. Stanford picked his own glass up, drained it dry, set it down, then he pulled the leather bag from his shoulder and placed it between them.

'Your money,' he said.

'And the rest?'

'When we've finished our business here to my satisfaction, one of your men can escort me back to Asunción and I'll give him the other half.'

'You might not do that,' the German said.

'Then your man will kill me,' Stanford said.

'Good,' the German said. 'You understand that. This makes me feel better.'

He finished his brandy, refilled both glasses, then leaned back in his chair and

offered Stanford that humorless smile.

‘There’s something else,’ Stanford said, wiping the smile from the German’s face. ‘I didn’t just come for information. I also want proof.’

The German straightened up, then leaned forward to stare at Stanford with steely, barely concealed anger.

‘Proof?’ he said quietly.

‘You heard me,’ Stanford said. ‘I know for a fact that you can prove it – and that’s what I’m here for.’

The German stared at him for a long time, hardly moving, expressionless, then his lips slowly curled into a smile as he sat back in his chair.

‘We have a jungle up north,’ he said.

‘I know that,’ Stanford said.

‘That jungle is hell,’ the German said. ‘You can take it or leave it.’

Stanford pushed his chair back, took his glass and stood up, then went to the leaf-covered railing and looked over the compound. The sun was sinking behind the forest, the sky violet and serene, the conifers and cypress silhouetted as twilight descended. A faint breeze stirred the dust up, blew it lazily across the barbed wire, let it drift around the Indians and *cuchilleros*, their shadows stretched out and merging. Stanford studied the forest. It seemed dense and somehow threatening. Stanford shivered and turned away, let his rage defeat his fear, then grinned and held his glass up to the German in a mock salute.

‘Here’s to hell,’ Stanford said.

They moved out the next morning, in the dawn’s bloody haze, heading into

the forest, following a narrow, dwindling path, shafts of crimson light boring through the gloom between the dense, soaring trees. The Ache beaters were out ahead, their machetes hacking and slicing, clearing a path for the short line of men stretched out behind them. Stanford marched beside the German, the huge Atilio protecting both of them, a few disheveled *cuchilleros* behind them, their guns and knives rattling. The forest was still cold, the dew glistening and dripping, the leaves underfoot damp and treacherous, branches whipping and spitting. The forest rustled and chattered. Stanford heard it and loathed it. The morning sun was fighting to break through and bleed into the chilling gloom.

'*Sehr gut*,' the German said. 'A good morning. It will soon be less cold.'

Stanford marched with some care, a small pack on his back, feeling cold and almost ill from lack of sleep, still not fully awake. He had slept in the German's house. The German's snoring had tormented him. He had tossed and turned uncomfortably on the hammock, the sounds of the forest in his ears. The forest never slept. The long night had taught him that much. He had heard jagged cries, staccato cackling, distant growling, the leaves rustling with a life of their own, the ground shifting and sliding. It was not much different now. Stanford glanced nervously around him. He saw tangled vegetation in the gloom, heard more unfamiliar, troubling sounds as his boots sank in mud. He did not like it one bit.

'How long will it take?' he asked.

'All day,' the German said. 'It is a very long hike, my American friend, and will possibly wreck you.'

'I'll make it,' Stanford said.

'I'll make sure of it,' the German said. 'You are good for the second half of the money and that makes you worth helping.'

Stanford tugged at the pack straps, felt the tingling of his skin, sweating even in the chill of morning, dreading the heat yet to come. He saw Atilio just ahead, his gross hips rolling rhythmically, a pistol and a couple of knives stuck down behind his broad belt. The forest seemed to be endless. It grew deeper and darker. The path dwindled away to nothing, disappeared, and the forest closed in on them. Stanford fingered his pack straps. His shoulders had started aching. He looked ahead and saw the machetes of the Ache beaters hacking down the tangled liana and banana leaves. Stanford felt tired already, heard the rasping of his lungs. He glanced resentfully at the German, saw his gaunt, weathered profile, and wondered how that frail, gangling body could endure such punishment.

‘You are with us?’ the German asked.

‘I’m still here,’ Stanford said.

‘*Sehr gut*,’ the German said. ‘You must suffer. It is part of your penance.’

‘What penance?’ Stanford said.

‘Why ask me?’ the German retorted. ‘But a man does not come to this place just because of the saucers.’

‘That saucers are a mystery.’

‘And you came here for a mystery?’

‘I came because I lost a couple of friends and I want to know why.’

The German nodded and grinned. ‘Ah,’ he said, ‘I see. And those friends were involved with the saucers. *Ja*? Am I right?’

Stanford didn’t reply. He didn’t want to think about it. The forest chattered and slithered on all sides, and he felt his flesh creep. He would never find the answers. There were too many questions. He tried to think, but the sweat

dripped into his stinging eyes and reduced him to pettiness. All right, think: he would think. He thought of Epstein in the mountains. He closed his eyes and saw the blackness rushing at him and exposing the stars above. His old friend had gone away. The months since then had not been pleasant. During the day, at night, whether awake or deep in sleep, he had suffered the dreams of those who knew that they were haunted and lived with their helplessness. Stanford knew he was being followed. He didn't know, but he was certain. Yet each time he tried to think objectively about it, he collapsed into what seemed like paranoia. He now understood paranoia. He knew what the frightened felt. He had turned into an old man overnight and might never recover. Stanford fingered his chafing pack straps. He glanced nervously around him. The forest rustled and slithered with alien life forms that did not offer comfort.

'Your friends disappeared?' the German said.

'Yes,' Stanford replied.

'That is not so unusual,' the German said. 'It happens here all the time.'

'You mean the Ache,' Stanford said.

'Just so,' the German said. 'The Ache disappear in their hundreds, melting into the trees.'

'You do it,' Stanford said. 'You make them disappear. You sell them or use them as slaves and then you bury them deep.'

'You disapprove,' the German said.

'Damned right, I disapprove.'

'You're a guilt-ridden American,' the German said, 'and your conscience is easily pricked.'

‘Fuck you,’ Stanford said.

‘*Sehr gut,*’ the German said. ‘Nevertheless, there are many disappearing that we cannot account for.’

‘*Wunderbar,*’ Stanford said.

‘I am serious,’ the German said. ‘The Ache disappear too fast. We cannot account for their numbers and the saucers are blamed for it.’

The came out of the forest. A broad savannah stretched before them. Stanford blinked and felt an awful blast of heat that almost sucked his lungs dry. He rubbed his eyes and looked ahead, saw a sea of waving grass, a few barren trees here and there, the sky white, the sun dazzling. Stanford felt that he was melting. He drained down into the earth. He stared across the sea of grass, saw it shimmer and undulate, and longed for the comforts of a city and its seductive parameters. He fingered his chafing pack straps, licked his parched, cracking lips. The heat was monstrous and it closed in around him and make him gulp like a drowning man.

‘Beyond that is Boqueron.’ The German spoke with calm indifference. ‘It sits between Argentina and Bolivia and Brazil, and within it is the jungle I mentioned – a place to avoid.’

‘But that’s where we’re going,’ Stanford said.

‘You will remember it,’ the German said, ‘for as long as you live. What you want is hidden deep in the jungle, and you must pay the price.’

The German seemed pleased. He smiled at Stanford as he moved on. Stanford gulped and felt the heat burning through him as he stumbled ahead. The air was hot and clammy. He put on his sunglasses. The Ache Indians were already in the savannah, their machetes flashing in sunlight. Stanford marched beside the German. The huge Atilio was just ahead. The *cuchilleros* were moving out around them, hacking at the tall grass. The sun blazed down

on the grass, on the scattered, scorched trees, turned the sky into a sheet of white steel that radiated tremendous heat. Stanford tried to think clearly, but his thoughts slipped and slid in wild abandon, as if out of control… Epstein clambering up the hill. The black sky peeling back. The dark globe shrinking high in the sky, flaring up, disappearing… He was doing it for Epstein. He would not let Epstein go. He would not be defeated by Wilson and his fellow conspirators… Stanford wiped sweat from his brow. He was waist-deep in the grass. The sea of grass shimmered and stretched away to a silvery haze.

'The Ache,' Stanford said. 'What do you mean, they disappear? You said you can't account for their numbers. What do you mean by that?'

'They disappear,' the German said. 'We are not the ones taking them. We go to their villages, we find the huts empty, we search the surrounding forest and find nothing… They have just disappeared.'

'Other traders?' Stanford suggested.

'No,' the German said. 'We all know each other quite well – and we all suffer the same thing. The Ache are not removed by traders. Such abductions would be impossible. Paraguay is a very small country and is strictly controlled. The Ache disappear in their hundreds. They disappear overnight. The only way out is along the river, but they've never been seen there.'

'Airplanes?' Stanford suggested.

'They can't land in the forests. *Nein*, it cannot be airplanes, so we believe it's the saucers.'

Stanford heard the rustling grass, felt it brushing against him, had visions of the life beneath his feet, of poisonous snakes and giant rats. He shivered and kept going, trying not to look down, the muscles tightening in his belly, the sweat pouring down his face, the dark glasses inadequate protection against the sun's fierce white glaring. The grass snapped and broke around him. The

Aches' machete blades were flashing. The *cuchilleros* formed a loose protective circle, their knives and guns rattling. Stanford felt that he was dying, his breath burning in his lungs. The pack jumped up and down on his shoulders and made his whole body ache.

'Many saucers,' the German said. 'We see the saucers all the time. They come down on the Chagres, on the Gran Chaco and the Mato Grosso, and afterward all the Ache have disappeared and are not seen again.'

'The saucers *land*?' Stanford asked.

'*Ja*, they land,' the German said. 'They descend into the forests. They descend where there is nothing but swamps, and yet they always take off again. They must hover above the swamps. We cannot explore such areas. But they appear to descend over the swamps and take the Ache away.'

The sweat poured down Stanford's face, soaked his armpits and body; his feet were burning in the canvas jungle boots, his throat dry, his head tight. He tried to think of the reports, shook his head, tried again… dark skin, narrow eyes, uncommonly small, Oriental… the most common characteristics as described by numerous contactees. Such descriptions fit the Ache. They were small and Mongolian. Stanford struggled through the tall grass, exhausted and half blind, the muscles in his belly growing tighter with excitement and tension.

'You feel good?' the German asked.

'I feel rotten' Stanford confessed.

'You're an American,' the German said. 'That means you're weak. You should thank me for this.'

'Thanks,' Stanford said.

'Don't thank me,' the German said. 'Just stay on your feet until we get there.

It is still a long way.'

The savannah seemed endless, a rustling, yellow sea, the tall grass bending under Stanford's feet, springing back up around him. He secretly blessed the Ache beaters. Their machetes flashed in the sunlight. They worked hard and the sweat soaked through their shirts and streamed down their dark faces. Here and there were lonely trees. The blazing sky was a white sheet. The air was hotter than ever and more humid, suffocating, a giant glove slipping over him. Stanford wiped sweat from his eyes. His shirt was sticking to him. The light shimmered and distorted the waving grass and played tricks with his vision. He blinked and licked his lips. Pains were darting up his legs. The heat swam all around him, burned his skin, sucked his lungs dry; the brightness of the sky was overwhelming, a vast, silvery furnace.

One of the Ache Indians screamed, waved frantically and fell, disappearing into the rustling, waist-high grass while the others all scattered. Atilio cursed and raced ahead, tearing his pistol from its holster, a knife jumping up and down on his left hip, the grass parting before him. Confused, Stanford stopped walking. He heard the screaming of the Indian. Another Indian raised his machete above his head and swung it down into the tall grass. The hidden Indian kept screaming. Stanford shrank from that dreadful sound. The German muttered and rushed up to join Atilio, the *cuchilleros* surrounding him. Atilio bawled and waved his pistol. Stanford caught up with the German. They both stopped beside Atilio and looked down at the Indian on the ground. He had been bitten by a snake. He was wriggling dementedly and shrieking. Another Indian stood beside him, his machete dripping blood, the snake's amputated head at his feet, the headless body nearby.

'*Scheisse*!' the German hissed. 'We have no time for this. Finish the Indian.'

It was over quickly, Stanford hardly knew what was happening. He saw the Indian on the ground, pouring sweat and shivering badly, holding on to the leg that had been bitten and now moaning pitifully. Then Atilio knelt down, grabbed the Indian by the hair, jerked his head up and poked it with the pistol

and then pressed the trigger. The sudden bang made Stanford twitch. He saw the Indian's head jerking. Blood and bone splashed on the ground beneath the head, and then the head itself fell. Stanford blinked and looked again. Atilio stood up and blocked his view. Atilio bawled at the watching *cuchilleros*, who then turned on the Indians. They were all shouting at once as they pushed the Indian onward. The Indians moved out and swung their machetes, again hacking a pathway through the tall grass. The *cuchilleros* formed a circle. Atilio marched out in front. Stanford looked down at the ground, saw the snake's dismembered head, saw the brains of the dead Indian spilling out, his eyes glassy, his arms outstretched. Stanford blinked and licked his lips. He hurried after the marching German. The *cuchilleros* closed in on both as the grass swayed about them.

'You had him killed!' Stanford said.

'*Ja*, that is correct.'

'He could have been saved,' Stanford said.

'We haven't the time, *mein freund*.'

'What does *that* mean?' Stanford asked.

'Be quiet,' the German said. 'We couldn't have carried him. It is too hot for that.'

'You bastards,' Stanford said.

'*Sehr gut*,' the German said. 'At least you still have enough energy to show your resentment.'

'It was a swinish thing to do.'

'You are here of your own free will. That makes you a collaborator, *mein freund*, so don't offer me pieties.'

Stanford couldn’t deny it, felt ashamed, kept his mouth shut, bent forward and pushed against the tall grass, wondering when it would end. The sun crossed the burning sky. The heat increased and dissolved him. He bled down through himself, through the earth, and lost touch with reality. The machetes flashed up ahead. The *cuchilleros* surrounded him. Atilio marched on in front, his hips rolling, his gun and knives jangling. Time slowed and then stood still. Stanford tried to stop thinking. The white sun started sinking in the sky, became gold and then violet. Stanford saw the yellow sea. He blinked and looked again. There was a dark line between the sea and sky and he wondered what it might be. A sea: a yellow sea. Not a sea: a scorched savannah. Stanford blinked and saw the dark line as a snake that crossed the frame of his vision. He heard the snake and felt it. He tried not to look down. He thought of the *capibara*, the giant rats, and a severe chill cut through him. He shuddered, but kept walking. The German was still beside him. The German’s gaunt profile was hazed in silvery light; the yellow sea was the tall grass. The sun shifted in the sky. It sank lower, turning purple. The dark line divided the grass from the sky and took shape as a forest. Stanford almost sobbed with joy. He felt as if he were on fire. He was burning and his body seemed hollow and drained of all feeling.

‘There it is,’ the German said.

‘Thank God,’ Stanford said.

‘You will not thank God once you are there. That’s the devil’s playground.’

Stanford tried not to listen. He didn’t want to believe it. He did not believe that it was possible to feel worse than he did now, did not believe that any place could be worse than the blistering savannah. Those trees formed a forest. Not a jungle: a forest. In there, in the shade of the trees, it would have to be cooler. Stanford felt a great joy. He followed Atilio toward the trees. The Ache beaters were out ahead, their machetes flashing, the grass snapping and falling. Stanford wiped sweat from his face. The white sky was streaked with violet. Stanford grinned and moved faster, felt the pack on his back,

ignored it, ignored his exhaustion and pain, and hurried into the forest.

His spirit plunged and died. He couldn't believe the heat was real. His lungs burned and he felt that he would drown in his own pouring sweat. He hadn't known he could sweat so much. He wondered where it all came from. He rubbed his eyes and glanced around the green gloom, saw it steaming and glistening. Stanford felt a deep dread. Here everything was outsized: the tangled vegetation, the huge plants and quivering leaves, the crawling insects and chattering birds and monkeys, the giant rats in the undergrowth. Stanford felt his flesh crawling. He felt trapped and suffocated. The forest chattered and shrieked, hissed and growled, its steam rising in faint light.

The machetes flashed in the gloom, slashing branches and leaves, the Indians ripping the shrubbery aside, their nut-brown bodies sweat-slicked. Stanford choked back his sobs. He felt petty and childish. His despair was a void at his center and it threatened to swallow him. Something crawled across his foot. He glanced down and saw a spider. It was huge and ink-black, its body covered in gleaming hairs, and he kicked out frantically, almost screaming, and saw it flying away. He shuddered and wiped his brow. He saw the German smirking at him. He felt rage and the rage drove him onward and brought back some strength. A bat flew above his head. Its beating wings merged with the leaves. Stanford shuddered when the leaves brushed his face with the feel of warm slime. He cursed softly and moved faster. Tangled vines trapped his feet. He knelt down and tore the vines from his boots and saw a lot of large ants. They were devouring a dead rabbit. Not a rabbit: a giant rat. Stanford shivered and then something stung his hand and he slapped the ant off. He stood up and walked on. The forest steamed and dripped around him. It was chattering and shrieking, alive with crawling things, that undergrowth shifting and rustling, furry forms racing back and forth.

'You are all right?' the German asked.

'Yes, I'm okay.'

‘You do not look too good,’ the German said. ‘You seem a bit shaken.’

‘I’m okay,’ Stanford insisted.

‘You have tenacity,’ the German said.

‘Just get me there, you bastard,’ Stanford said. ‘I won’t crack until you do.’

The forest opened around a swamp. A crimson light poured through the trees. He saw the bones of various animals in the clearing, the swamp steaming and stinking. The Indians led them around the edge of it. The *cuchilleros* cursed and groaned. Atilio slapped one of the men on the face and then kicked him onward. Someone screamed and started sinking, his eyes wide and frightened. The slime oozed and bubbled up around his knees as he waved his hands frantically. Atilio cursed and bawled some orders and some Indians rushed toward him. They formed a chain and reached out for the sinking man and pulled him out of the mud. The man rolled onto his back, but Atilio brutally kicked him. The man yelped and jumped up and then quickly moved on. Atilio followed, bellowing orders. The forest closed in again. The heat clamped around Stanford, drenching him, suffocating him, but he choked back his nausea and stumbled on, carefully scanning the green gloom.

The forest opened out again. He saw a village in crimson light. He saw a river of blood on his left as they passed through the village. The natives stared silently at them out of dark, haunted eyes. Children played in the dust, swallowed worms, their bodies almost transparent. The *cuchilleros* ignored them, but kept pushing the Indians onward. The forest closed in again, a green gloom filled with steam, the heat monstrous, the humidity soul-destroying, the foliage shrieking and chattering.

Stanford felt that he was dead. He could scarcely recall why he was here. His body burned and was covered in slime and his felt his skin peeling. He was nothing. He was *now*. He was in and of the forest: the snake and the spider and the rat and the other teeming, unseen life. The huge leaves dipped and

dripped, the vegetation hissed and steamed. He was boiling blood and aching bones and filth, but he soared above it all. The trees held him and protected him. The green gloom was his sustenance. He swallowed bile and drank in the scalding air and rubbed his eyes and saw shooting stars. Then more gloom. Shafts of sunlight. The distant cries of the Indians. The trees parted and let him walk though and he saw streams of crimson light.

They were in another clearing. A towering cliff face blocked their way. The sinking sun was an immense bloody globe that turned everything red. The cliff face was high and jagged. The rock looked like flowing lava. The *cuchilleros* and the Indians, Atilio and the German, all were frozen in that unreal crimson haze, staring up at the wall of rock.

Stanford followed their gaze. He shook his head to clear it. He saw tree trunks and planks, tangled vines and banana leaves, all piled up to block off the entrance to a cave in the cliff face.

‘This is it?’ he asked.

‘Yes,’ the German said. ‘It’s a shrine. The natives worship at this shrine. And the shrine is your proof.’

He stepped forward and barked some orders. The Indians swarmed across the cliff face. The *cuchilleros* moved back and raised their rifles, not looking too happy. Stanford watched them, feeling dazed. His throat was dry and he felt ill. The Indians worked at the vegetation, pulling the leaves and vines away, removing the planks and then tackling the leaning tree trunks, pushing them over. The debris crashed to the ground. A cloud of dust billowed upward. The dust sparkled in the radiant crimson light and turned the Indians to specters.

Stanford stared through the dust. He saw the dark mouth of the cave. Stepping forward, he saw a dull, metallic gleaming behind the crimson haze. The last of the tree trunks were rolled aside. Crashing down, they raised more dust. The Indians looked at the cave with frightened eyes and then hurried

away. Stanford stepped forward again. His senses suddenly rushed back. His heart was pounding when he saw the metal gleaming in the spiralling dust.

The crimson light flooded the cave. Stanford almost stopped breathing. He saw a jigsaw of coiling black lines and irregular pieces of dully gleaming metallic-gray. He stepped forward for a closer look. It was a solid metal sphere. It was about thirty-five feet wide, it swept up to a dusty dome, and the black lines were a coiled mass of snakes, all asleep on the saucer.

‘Oh, my God!’ Stanford whispered.

He stood there for some time. He couldn’t believe what he was seeing. There were at least a hundred snakes on the saucer, their bodies coiled and intertwined. Stanford felt his flesh creep. He saw the silvery-gray metal body. The perimeter swept smoothly up to the dome, making the saucer, despite the presence of the snakes, look oddly beautiful. The natives thought it was a shrine. Stanford understood their feelings. His fear departed, giving way to exhilaration. The saucer was magnificent. Its polished surface seemed seamless. It stretched across the mouth of the cave and was bathed in the crimson light.

‘What happened?’ Stanford asked.

‘It crashed years ago,’ the German said. ‘The natives thought it was a gift from the gods, so they dragged it in here.’

‘Was there anyone in it?’

‘I think so. I assume so. But there’s no way to open it up – and now the snakes keep us out of there.’

Stanford’s heart was pounding. The sublime machine mesmerized him. He saw the intertwined, sleeping snakes on the dusty dome, still and silent, together forming a protective, deadly tapestry. Stanford felt himself shaking. He couldn’t bear it any longer. He stepped forward, intending to walk to the

saucer, determined to touch it.

A single shot rang. The bullet ricocheted off the saucer. Stanford gasped and stepped back and turned around and saw the men looking at him. Frozen in crimson light, they looked hazy and unreal. The tall German had a pistol in his hand and was waving it gently.

‘Don’t do that,’ he said. ‘Don’t try to touch it. If you do, you’ll soon be a dead man.’

Stanford looked at the saucer. His flesh crawled at what he saw. The snakes were all awake, slithering through one another, wrapped themselves around the dome, dangling over the edges, hissing and spitting and sliding along the smooth, seamless surface. Stanford shook even more, exhaustion finally claiming him. He stood there in the clearing, the dust billowing about him, staring through the swimming crimson haze at the snakes on the saucer.

‘Your proof,’ the German said. ‘Now I talk.’

-
-

CHAPTER THIRTY-ONE

‘Let me begin at the beginning. In 1933, when Hitler took power, the greater part of German science was totally subordinated to the creation of new military weapons. Thus, by 1935, research on rockets and other forms of aerial warfare had advanced by spectacular leaps. Now, the common assumption is that most of that work was being done by Walter Dornberger, Karl Becker, Klaus Reidel, Helmut Grottrup and Wernher von Braun, but such was not in fact the case. Most of the fame attached to those gentlemen resides in the fact that they all worked on the V-1 and V-2 rockets,, that the majority of them went to America after the war, and that once in America they became even more well known for their NASA work on space exploration. *Sehr gut*. However, the real pioneer of Germany’s World War Two achievements was the American, Wilson.

‘In 1935 most of the German rocket research was being undertaken at the experimental stations in Reinickendorf and Kummersdorft West, not far from Berlin. It was to Kummersdorft West, where I was then scientific administrator, that Himmler personally came to introduce Wilson. And what really astonished me, apart from the fact that Wilson was an American, was the extent of the powers that Himmler intended giving him.

‘By the middle of 1935 it had been decided that the Reinickendorf and Kummersdorft research centers were no longer big enough to house the rocket projects. That same year, Wernher von Braun had suggested using an island in the Baltic, named Usedom; this island was situated close to Szczecin at the mouth of the Oder River, and it was densely wooded, sparsely inhabited and relatively isolated. It was therefore decided to move the two

research centers to the northern promontory of Usedom, near to the small village of Peenemüde… And this mysterious man, Wilson, this stranger from America, was to take over Kummersdorft West when the rocket teams left.

‘It was an unusual situation, but not as impossible as it might at first seem. While Germany was now a nation under constant surveillance, that surveillance was carried out by the Gestapo and the SS, and those organizations were strictly controlled by Himmler. Himmler’s SS were unique, a law unto themselves; they answered neither to Hitler nor to the German High Command, but only to their beloved Reichsführer, their demigod, Heinrich Himmler. In fact, Himmler controlled Germany. He did it quietly and surreptitiously. He quietly took over schools, universities and factories, and soon he had his own research centers scattered all over Germany. Thus Himmler controlled Germany – he controlled the flow of information – and his projects were shrouded in a secrecy that would never be broken.

‘Wilson’s project was such a secret. It was known only to a few. His research centers were filled with meticulously chosen technicians and constantly patrolled by the SS. He was a genius, almost certainly. I don’t doubt it at all. He was cold and brilliant and relentless – and nearly inhuman. His sole passion was science, his knowledge beyond belief, and he rarely discussed anything but his work and the need to complete it. That’s why he was in Germany. Only Germany could meet his needs. He had limitless facilities and slave labor and Himmler’s personal support. That’s what he wanted. He didn’t care about anything else. He needed money and muscle, and he didn’t give a damn where they came from.

‘So! Given carte blanche by Himmler, Wilson quickly strengthened his project: pulling in other departments, utilizing other research centers, and stealing more technicians wherever he found them, working through the SS. Now while this had many advantages, unfortunately it also meant that Wilson was forced to take on some engineers whom he didn’t really care for all that

much. Included in these were the German scientists, Habermohl and Miethe, the aging Italian, Dr Belluzzo, and the ambitious Luftwaffe engineer, Rudolph Schriever. Most of those men were actually there to watch Wilson, and their presence around his project really annoyed him. He therefore kept them busy by letting them work on various designs, which they could then forward at regular intervals to Himmler. Few of the designs were worth the papers they were drawn on, but they kept Himmler happy, soothed the vanity of his four supposed innovators, and enabled Wilson to get on with the real work without too much interference.

‘Determined that his project should be the most advanced then in existence, Wilson traveled all over Germany, visiting the other research centers, and utilizing any innovation that could enhance the possibilities of his own project.

‘At this point you must understand that while it is true that the German scientists as a whole were then working on some remarkable innovations, it is equally true that their separate projects were rarely coordinated. So great were the rewards in Nazi Germany, and so terrible the penalties, that even formerly cooperative scientists were reduced to seeking favor by competing ferociously with one another. In this sense, the Peenemünde situation was typical: while we had the cream of our rocket engineers working on the V-1 and V-2 rockets at Peenemünde, the V-1 wasa Luftwaffe project, the V-2 was an Army project, and both sides competed with one another instead of putting their heads together. Similarly, while various establishments scattered all over Germany and Austria were working separately on gas turbines and jet propulsion, heat resistant and porous metals, and gyroscopic mechanisms and boundary layer-defeating airfoils, it was not until the arrival of the relentless Wilson that someone had the sense to link these innovations together in one astonishing, revolutionary aircraft. Wilson did that – he combined the cream of German innovations – and in five years he had completed the prototype of his first flying saucer.

‘Now, Himmler was excited by the possibilities of the flying saucer, but he never mentioned the saucer to Adolf Hitler. Indeed, the only thing *der Führer* knew about Kummersdorft West was that it was only one of many aeronautical research centers and that it was probably engaged in producing conventional aircraft. Regarding technological matters, Hitler knew very little, since he expected Himmler to keep him informed. That was a mistake. Himmler kept a lot to himself. So Hitler knew about Peenemünde, about the V-1 and V-2 rockets, but otherwise he only heard about “secret” weapons that were still being processed.

‘Himmler had good reason for his secrecy. Back in 1938, Hitler, anxious for a foothold in the Antarctic, had sent an expedition commanded by Captain Alfred Richter to the coast due south of South Africa. Daily for three weeks two seaplanes were catapulted from the deck of the German aircraft carrier, *Schwabenland*, with orders to fly back and forth across the territory that Norwegian explorers had named Queen Maud Land. The Germans made a far more thorough study of the area than the Norwegians had done – believed to be the most extensive aerial study undertaken up to that time – finding vast regions that were surprisingly free of ice. Their airplanes covered two hundred and thirty thousand square miles in all, photographing almost half of the area. They also dropped several thousand metal poles, each marked with the swastika and pointed at the tip so that the poles would dig into the ice and remain upright. This job done, they renamed the whole area *Neuschwabenland* and then claimed it as part of the Third Reich.

‘From that moment on, men and equipment were shipped regularly to Neuschwabenland for the purpose of building a secret underground military base. Most of the men were either specially trained SS troopers or slave workers from the concentration camps. Now, while Hitler was aware of the fact that Himmler was shipping his men to the Antarctic, he thought of it as a purely military endeavour. As far as *der Führer* was concerned, the secret base in Antarctica, being constructed underground, was merely an SS training base designed to acclimatize scientists and soldiers to those rigorous

conditions in preparation for explorations after the war. However, the truth is that Himmler was pursuing a dream that did not include Hitler, would supersede the Third Reich, and would place Himmler up there with the immortals as the Lord of Atlantis.

‘Let me clarify this. Himmler’s obsessions were numerous, bizarre and totally mad: sorcery, mesmerizm, clairvoyance, reincarnation, faith healing, Lemuria, Atlantis, the mystic strength of the *Volk*. Himmler also believed absolutely in Horbiger’s fanciful doctrine of Eternal Ice – that a world of ice was the natural habitat of Nordic men – and he therefore also believed that a return to such a world would lead to men who were like gods. It was because of this dream that Himmler, when he was given the task of organizing the SS, did not envisage it as a normal police force but as a real religious order devoted to the creation of the perfect man. Indeed, right from the start it was his intention to eventually isolate the “élite” of the SS from the world of ordinary men for the rest of their lives. It was also his intention to create special colonies of the “élite” all over the world, answerable only to the administration and authority of Himmler’s New Order.

‘For this, the first step was the creation of special schools in the mountains of Bavaria where the SS élite were indoctrinated in Himmler’s ideals and firmly convinced that they were the unique new men “far finer and more valuable than the world has yet seen.” The second step was the creation of the *Ahnenerbe* – the Institute for Research into Heredity – whose function was to finance and publish Germanic researches and to supervise the so-called “anthropological” medical experiments in hellholes like Auschwitz and Dachau. The third step was to eliminate the Jews from the face of the Earth, and to transport all subhumans – the Poles, Czechs and Slavs – to the numerous concentration camps and keep them there, generation after generation, as slaves to the Reich. And the fourth and most important step was the *Lebensborn* – Spring of Life – which would, through the controlled mating of élite SS men and pure Aryan women, breed out the “imperfect” German types within one hundred years.

‘A world of ice and fire: the Antarctic and the SS. This dream obsessed Himmler night and day and then became a reality. He had his colony: the Antarctic. He had his masters: the SS. He would send his slaves to the Antarctic, use them for labor and as medical or surgical guinea pigs, and in time, with scientific application, the Superman would be born.

‘You do not believe, Herr Stanford? You do not think it possible? Then think of the *Ahnenerbe* and the *Lebensborn*, of the medical experiments and controlled breeding, of Belsen and Buchenwald and the SS torture chambers, of the millions who were processed like battery hens and emerged as warm ash. The concentration camps were no accidents. They indulged in imitative rites. They were the prototypes for the social order of the future: that world of masters and slaves… And think again, Herr Stanford, of the *Lebensborn*. Apart from arranging matings between the SS élite and fine blonde ladies and adopting “racially suitable” children for childless parents, the *Lebensborn* also abducted thousands of “suitable” children from the occupied territories and had them raised in special SS institutions… And a lot of those children – indeed, thousands of those children – simply disappeared from the face of the Earth.

‘So, it was Himmler. Hitler never knew about it. Himmler wanted his secret colony, he wanted his world of ice and fire, and he wanted the extraordinary flying saucer for his future protection. Thus it was that by 1943 more concentration camp prisoners and children abducted by the *Lebensborn* were being shipped to the Antarctic, and that a lot of valuable equipment, including components for the flying saucer, were disappearing via the South Atlantic route in SS controlled submarines.

‘Alas, Himmler’s dream then collapsed. By that time it was clear to most of us that the war would eventually be lost. This awareness put Hitler in a panic, made him yearn more desperately for some extraordinary new weapons, and finally encouraged him to look fondly at the V-1 and V-2 rocket projects. Then, after the August 17 bombing of the Peenemünde research centers,

Hammler persuaded Hitler to hand the whole project over to the safekeeping of the SS. A month later, on September 3, 1943, SS General Hans Kammler was put in charge of the transfer of most of the Peenemünde development works – not including Wernher von Braun – to caves in the mountains near the Traunsee in Austria, and mass production of the rockets to the underground factory in Nordhausen in the Harz Mountains. This effectively gave Himmler a new pet project and distracted him from Wilson.

'By early 1944, Wilson, now working at the BMW *Platz* near Prague, had replaced his original flying saucer's turboprop propulsion system with a new, highly advanced jet propulsion system, thus completing the first truly operative machine. It was Wilson's intention to test-fly the machine as soon as possible, but increasingly darker thoughts about Himmler put him off this idea.

'Bear this in mind about Wilson: As a child in America he had, like our own Wernher von Braun, been obsessed with the potential of space flight. A genius himself, he had secretly worked with the genius Goddard, and had observed how that gentleman was mistreated by his own country. Because of this – and because of his bad experience in Iowa – Wilson was obsessed with the need to avoid a similar fate and find absolute freedom regarding his work. That freedom was to be found in the Antarctic. It was to be found in a master and slave society. And Wilson wanted that society to succeed more than anything else.

'By 1943, however, it was Wilson's belief that Himmler was basically insane, that he would eventually fall apart, and that he would then represent a threat to Wilson's plans for escaping. Knowing that this view was shared by a few other high-ranking officers, Wilson waited until the time was ripe – when the forthcoming defeat was evident – and then approached them with a separate escape plan. One of those officers was myself, another was SS General Hans Kammler, and a third was SS General Artur Nebe, a very secretive man. It being that both Kammler and I had been directly responsible

for the utilization of slave labor, and that Nebe had been in the Gestapo and had also headed an extermination squad in Russia, we were all well aware of what our fate would be should the Allies get hold of us. Needless to say, we fell in with Wilson's plan.

'The crux of the plan was to make Himmler forget our project and turn his attention elsewhere. Consequently, Wilson started to lie about his project and submit incomplete drawings to Himmler and one of his favored engineers, namely *Flugkapitän* Schriever. While never going far enough to make Himmler suspicious, Wilson nevertheless understated the actual progress being made and told Himmler of bad setbacks, involving labor and equipment, that never for one minute existed. This worried Himmler – like Hitler, he desperately wanted an extraordinary new weapon – and as anticipated, he turned away from Wilson and looked elsewhere.

'This brings me back to Wilson's unwanted associates, particularly *Flugkapitän* Rudolph Schriever. Now remember that it was mostly the unworkable drawings of Schriever that had been passed on to Himmler – *not* the more advanced Wilson drawings. Therefore, in accordance with Wilson's plan, Hans Kammler, shortly after the Allied invasion of Europe, intimated to Himmler that the Schriever drawings were more advanced, that Wilson was maliciously holding Schriever back, and that Schriever should be given his own research facility and allowed to continue with his work without further interference. Kammler also suggested that because of the terrible bombing raids over Berlin and its surrounding areas – and because of the successful Allied invasion – the research center at Kummersdorft West should be evacuated to a more inaccessible, secret area. He suggested that Wilson's project be moved to Kahla in the mountains of Thuringia, and that Schriever's new project be located in a desolate area of Mahren. Himmler agreed to this.

'On June 22, 1944, shortly after having fitted his saucer with jet propulsion, Wilson moved from Kummersdorft West to Thuringia. A week later, with

Schriever in charge, the remaining staff of Kummersdorft West were moved to a secret location in Mahren. Thus, while Schriever's progress could be watched closely by Himmler, Wilson could complete the genuine flying saucer under the protection of Hans Kammler and myself.

'What we now needed was a tightly controlled escape route that would take us from Kahla to Kiel in the Baltic. The best man for such a task was clearly Artur Nebe, an SS general with a keen sense of survival and sound training in all kinds of intrigue. Unfortunately, while Nebe had once been one of the most favored of the SS, he was now under suspicion from those closest to Hitler and knew that he was being watched all the time. Nebe had to disappear – he would have to work in anonymity – and his chance came on July 20, 1944, after the attempted assassination of Hitler.

'That assassination attempt led to the most terrible reprisals, and many of our officers, in fear for their lives, fled and then disappeared for good. One such officer was General Nebe. He had a lot of fanatical followers. Nebe fled straight to Kahla, took a lot of his men with him, and those men organized the escape route from Kahla to Kiel. Thus it was that by early 1945 important men and materials were being quietly moved from the research complex in Thuringia to sympathetic submarines and ships in Kiel harbor on the Baltic Sea – the moves officially authorized by favored SS General Hans Kammler and tightly controlled by the anonymous General Nebe and his other "missing" SS men.

'Kammler was in the perfect position to arrange all this. Now trusted implicitly by Himmler – and therefore revered by his SS troops – Kammler could move men and equipment anywhere without being questioned. More so because by this time he had been placed in full charge of the V-2 program and that program had become Hitler's final hope. Naturally, since the job gave Kammler the freedom to travel at will around the German-occupied territories, he worked like a demon on the launching of the V-2s and made sure that all his movements were noticed. In this way, Wilson could assemble

the complete prototype of his flying saucer in the underground factory at Kahla – undisturbed by the increasingly disillusioned Himmler, ignored by the V-2 obsessed Hitler, and otherwise protected by General Nebe and his runaway subordinates.

‘Kammler had another useful job at this time. While the infamous Alpine redoubt had never really existed, Hitler was still dreaming of forming a last redoubt in the mountains of Germany. Since his chosen area was to include the metaphorical arc that ran from the Harz Mountains to Thuringia, south of Prague and across to Mahren, Kammler was put in charge of all the important research centers hidden deep in those areas. Again, this made it easy for him to protect Wilson’s project in Kahla and insure the continuing shipment of men and supplies to the ships and submarines in Kiel Harbor.

‘By early February 1945, Wilson had completed a truly advanced flying saucer and a test flight was arranged for the fourteenth of that month. Unfortunately, when the saucer was wheeled out of its hangar during the early hours of that morning, bad weather, including rain and snow, caused the test to be canceled. Two days later, however, a resoundingly successful test flight was made.

‘The saucer tested near Kahla on the morning of February 16, 1945, was known as the *Kugelblitz*. Basically, it was a triple-layered, disk-shaped machine with a diameter of fourteen thousand and four hundred millimeters and a height from base to canopy of three thousand and two hundred millimeters. The central body was made from heat-resistant, nickel-based alloys and titanium; and the top and bottom disks of this circular body rotated at varying speeds around the two-pilot control cabin, which was molded to the solid body that housed the engine. While the spinning disks were devoid of all surface protuberances such as wings and stabilizers, their porous metal composition would suck the air through the machine and utilize it as an added propulsive force.

‘As with the previous turboprop version, this saucer’s four legs also

functioned as downward thrusting, swiveling tail pipes used for lift-off, but now activated by low and high pressure compressors generating an enormous thrust and including a new vaporizing fuel injector system that rendered the jet thrusters smoke-free. The jet burners lifted the *Kugelblitz* vertically, at modest speed, to a height of just over one hundred feet; once there, the downward thrusting tail pipes would swivel up through the bottom disk and be locked into position in the molded central body. Four similar boosters, situated at equal distances around the immovable central body, would then be used for horizontal propulsion and direction control, while the upper and lower disks, with their porous composition, would revolve at high speed to utilize the boundary layer and achieve unprecedented high speeds.

'The *Kugelblitz* was in fact a giant-sized *Feuerball* – the most recent spin-off from Wilson's endeavours – and as such was remarkably sophisticated. During the test flight it reached an altitude in excess of forty thousand feet at a speed of approximately twelve hundred and fifty miles per hour. Not yet capable of the extraordinary maneuvers of the modern UFO, it nevertheless incorporated a special inertial shield for the protection of the pilots; an automatic control system that utilized the profile of the terrain below; high frequency, omnidirectional, automatic navigation; and a few primitive, but fairly effective, pulse beam weapons.

'Naturally, with the flying saucer project completed, our most urgent task was to transfer the project to the Antarctic, obliterate all signs of our work in Kahla, and ensure that nothing was left for the advancing Allies. Bear in mind that we had, as each separate section of the machine had been successfully tested, been shipping those parts to the Antarctic, component by component, throughout the last few years. Now, the only components that still had to be shipped out were those belonging to the redesigned jet engines. Within a week of the test flight those components were removed from the *Kugelblitz*, the machine itself was blown up, and then Wilson, accompanied by Nebe and other SS personnel, made his way by truck and train to the port of Kiel. Two days after that, on February 25, 1945, the remaining slave

workers of the underground Kahla complex were driven back to Buchenwald where they were gassed and then incinerated in the crematoria. The Kahla complex was then a deserted shell.

‘Himmler never knew about the evacuation of Kahla since he was too obsessed with the rapid Soviet advance. To distract him further, General Kammler suggested that the scientists still at Peenemünde be made to join the others in Nordhausen, pointing out that a new research center was being built in the Bleicherode mine and that accommodations had been prepared for the technicians and their families in the surrounding villages. Himmler gladly agreed to this move, and not long after, Wernher von Braun and his associates were moved by train, truck, private car and barge to their new quarters deep in the Harz Mountains.

‘By this time, exactly as Wilson had anticipated, Himmler was falling to pieces. No longer trusted by Hitler, and having just made a fool of himself by allowing the Russian army to reach the outskirts of Berlin, he was spending most of his time in Dr Gebhardt’s sanatorium at Hohenlychen, seventy-five miles north of Berlin, and idiotically planning his private surrender to the Allies.

‘At the end of February, while Wilson and General Nebe were hiding just outside Kiel and Kammler was transferring the Peenemünde technicians to Nordhausen, I paid the *Reichsführer* a visit. Babbling dementedly, he told me that his peace negotiations were not progressing, that he was going to try approaching Eisenhower, and that he intended using Schriever’s flying disk as a bribe to the Allies.

‘Following Kammler’s instructions, I informed the *Reichsführer* that the Wilson project had made no progress, that Wilson had been shot while trying to escape toward the Allied lines, and that the research complex at Kahla had been evacuated and then blown up to prevent it from falling into Allied hands. I also told him that since the enemy would soon be reaching Hohenlychen, there was little chance of escaping to the Antarctic and that his

peace negotiations were therefore our only hope. Himmler, terrified by this news, asked me to inform Kammler that the last redoubt was to be held at any cost. Meanwhile, he, Himmler, would arrange for the Schriever disk to be tested as soon as humanly possible.

‘Knowing that the Schriever disk could not possibly fly, I returned to wait for Kammler at Nordhausen. At the end of March, Kammler returned to the Hague where he had, ostentatiously, been firing the last of the V-2 rockets on London. Unfortunately, just before we could join Wilson and Nebe in Kiel, Kammler received orders from Himmler stating that American forces were approaching Nordhausen and that the whole complex therefore had to be evacuated. Determined to ensure that no suspicion fell upon him, Kammler went ahead with this task.

‘However, Kammler did not go with the evacuees. Seeing a more surreptitious way of making his escape, Kammler, on the second of April, took about five hundred V-2 experts to the Bavarian Alps in the region of Oberammergau, traveling with them in his private SS train. Once there, the technicians were imprisoned in army barracks and guarded by some SS fanatics. Included in this group were Wernher von Braun and General Dornberger – and shortly after they were imprisoned, General Kammler quietly disappeared for good…

‘Did I go with him? Obviously not. On that very same day, when Kammler was on the train to Oberammergau, I returned to Berlin to check on the general situation. However, once in Berlin I found myself buried in plots, counterplots and other intrigues. As for Himmler, he just wouldn’t let me go. Now totally hysterical, hiding pathetically in his sanatorium, he was studying his horoscope, still trying to negotiate a separate peace, and babbling constantly about Schriever’s flying disk and how it could save us all.

‘In the end, it was Schriever’s worthless saucer that got me trapped in Berlin. Now believing that the Wilson project had been terminated and that Wilson had been shot, Himmler insisted that I supervise the test flight of Schriever’s

supposedly completed prototype. Reluctantly I did this – I arranged the test flight for mid-April – but the test was called off in the face of the Allied advance, the prototype was destroyed by the retreating SS, and Schriever's few worthwhile drawings were stolen from him and burned in my presence. After that, Himmler collapsed, eventually killing himself, and I fled the holocaust of Berlin and finally ended up here.

'And the others? On April 25, 1945 – five days after Hitler's birthday, two days after the first meeting between Soviet and US troops on the banks of the Elbe, three days before the Allies crossed to the Eastern Bank, and five days before Hitler killed himself in his bunker in Berlin – General Kammler joined Wilson and General Nebe aboard submarine U-977 – bound for the Antarctic.'

CHAPTER THIRTY-TWO

April 26, 1945. We had left Kiel illegally, not daring to ask for fuel, so we pulled into Christiansund South to fill up the tanks. The war news was bad. The Soviets were in Berlin. The Americans and Russians had finally met at Torgau on the Elbe. The end was in sight. The submarine submerged the next day and kept hugging the coastline. I often went to the hold to check the crate, though I knew this was pointless. General Nebe kept to himself, his dark eyes revealing nothing. General Kammler was obsessed with the radio and passed on the news. None of this news was good. The Reich was obviously about to fall. When the death of Adolf Hitler was announced, we all knew it was over.

Captain Schaeffer called a meeting. Nebe and Kammler sat together. General Kammler was tense and energetic, Nebe was expressionless. The war was over, Schaeffer said. That raised certain problems. There would be no submarine tankers in the South Atlantic, which meant no food nor fuel. We would have to change our plans. We would never make it to the Antarctic. With luck, we might reach Argentina, but we couldn't go farther.

I confess: I was shocked. My one thought was for the wilderness. I glanced at Nebe but his dark gaze was unrevealing, so I then looked at Kammler. The general's eyes were bright. He mentioned Colonel Juan Peron. He reminded us that Peron was a man who could not resist money. Kammler smiled when he said this. He was an organized man. He then added that he had already discussed the matter with the necessary people. General Nebe did not smile. Captain Shaeffer looked relieved. We agreed to head straight for Argentina at no matter the cost.

Not quite straight: a digression. Some of the crew became rebellious. The war was over and they wished to return to Germany, and Schaeffer agreed to this. We hugged the Norwegian coastline. We only surfaced at night. A few days later we reached the mountainous coast of Bergen and let the men off.

I climbed up to the deck. I had to breathe the cooling air. I saw patches of stars between the clouds, the dark water, the jagged cliffs. The men shivered on the deck. General Nebe surveyed them coldly. The men shuffled their feet on the deck and shook hands with their comrades. I looked across the calm sea. The coastline was featureless. The sea lapped against the submarine as the men clambered overboard. I felt a great yearning. I wanted to rest my feet on dry land. After this, we would spend months in the submarine, mostly submerged.

May 10, 1945. The real voyage began. My strongest memories are of constant heat and stench and the engine's bass rumblings. It was too long for sanity. We were living on top of one another. First a day, then a week, then two weeks, the submarine like a tomb. The North Sea and the English Channel. The blackened breast of Gibraltar. When we surfaced, our freedom was brief and airplanes made us fearful. In truth, we rarely surfaced. The hatch was opened to let air in. We would see a glittering circle of sky and then the hatch would be closed again. Then along the coast of Africa. A stolen glimpse of sun and sand. Then thirty-six days underwater, a nightmare of sweat and noise.

By June the crew was restless. There were arguments and fist fights. Once a man took his knife from his dinner plate and slashed the face of a friend. Captain Schaeffer gave them beer. He was a careful, thoughtful man. There was peace for at least another week, but then more fights broke out. General Nebe's dark eyes were watchful. His hand often stroked his pistol. He started pacing up and down the submarine, murmuring words here and there. His words calmed some restless souls. Nebe's dark eyes tamed their rage. They would stare at his eyes, at his pistol, and remember his history. After that, it

was easier. It was miserable, but less dangerous. We turned away from one another, faced the walls, and let our own thoughts sustain us.

We surfaced six weeks later. We were in the middle of the South Atlantic. A fierce sun burned a hole in the sky, and the green sea was placid. This reprieve was a blessing. The next month was more bearable. We alternated between floating on the surface and diving back to the depths. Then the Cape Verde Islands. We went ashore on Branca Island. The men frolicked on the burning white sand and washed themselves in the dazzling sea. That day was all too brief. The droning of aircraft made us leave. The submarine dived back to the depths and our journey continued.

Nevertheless, life was easier. We started surfacing almost daily. Once we stayed on the surface for a week by disguising the submarine. False sails and false funnel. From the air we looked like a cargo steamer. The airplanes droned overhead but ignored us, not suspecting a thing. The men waved at the planes. They fought their boredom with such humor. They would watch the planes flying away, and then lie down and sun themselves.

Nebe usually remained below. He liked the claustrophobic depths. Kammler paced the deck and searched the horizon like a man with no time to spare. Eventually we saw land. It was the coast of Rio de Janeiro. Kammler smiled and climbed down through the hatch to listen in on the radio. The news was not good. Kammler relayed what had happened. Another fleeing submarine, Captain Wehrmut's U-530, had recently put into the River Plate with unfortunate results. The whole crew had been taken prisoner and handed over to the Americans. Kammler told us this, studied us, enjoyed our despair, then grinned and mentioned a place called Mar del Plata and went back to the radio.

August 17, 1945. We docked at Mar del Plata. Four months after we had boarded at Kiel we stepped off in the Argentine. We had no need to worry. An arrangement had been made. From here we were to be transported to a secret airfield in Bahia Blanca, and from there flown directly to the

Antarctic.

The thought filled me with pleasure. I looked along the crowded deck. The Argentinian officials crossed the gangplank, their medals flashing and jangling. They did not look too happy. They were mopping their sweaty brows. I sensed immediately that something was wrong and crossed over to Kammler. He shook hands with the officials. The man with most medals whispered. Kammler's lips formed a single, thin line that expressed his concern. He then smiled at Captain Schaeffer. He introduced us to the officials. We all had wine and biscuits on the desk, the sun blazing upon us. A short delay, someone said. An unfortunate mishap regarding transportation. We would have to spend some days on the submarine before we could leave. Captain Schaeffer agreed to this. He was a reasonable, thoughtful man. The Argentinians all smiled and bowed politely and then left in a hurry.

I spoke to Kammler and Nebe. We met at midnight on the deck. It was dark and I saw the moon reflected in Nebe's depthless eyes. Kammler spoke in an urgent whisper. He told us what had really happened. He said that British and American Intelligence had picked up the information that Hitler was not dead and that he and Martin Bormann had escaped from Germany. Reportedly they had fled in a submarine. They were thought to be heading for Argentina. It was the British and American wish that the Argentinians report the arrival of any German submarines in their waters. Thus the Argentinians were in a panic. They felt that something must be done. What they wanted was to offer the Allies a little something to chew on.

General Nebe lived by intrigue. It was bread and meat to him. His dark eyes offered no pain or pleasure as he outlined a compromise. We three alone would leave. We would take the precious crate with us. But to save the Argentinians embarrassment, we would leave the rest of our men behind us. They would be held as political prisoners. The Argentinians would hand them over. That way, the Argentinians would look good and we would save our own necks.

Ruthless? Yes. But then the three of us were ruthless. We had lived in the Third Reich a long time and learnt how to survive.

We agreed to Nebe's plan. It could not possibly fail. The fate of Schaeffer and his crew did not concern us and could hardly affect us. It didn't matter what they told the Allies. By then it would be too late. By then we would be hidden in the Antarctic, our whereabouts unknown. The Allied forces would then be helpless. They would never locate our underground base. They would know that the underground base existed, but they wouldn't dare admit to it. How could they mention it? It would only lead to panic. And so, aware of this, knowing the Allies would be helpless, we decided to drop Schaeffer and his crew and go on by ourselves.

We unloaded the crate the next day. This aroused no curiosity. Schaeffer assumed that we were simply unloading it for safekeeping on shore. That same night we slipped away. Some army officers were waiting for us. I saw my crate in the rear of their truck and I climbed up beside it. Nebe and Kammler quickly followed. We glanced back at the submarine. We saw the other troops moving along the dock, their rifles aimed at the submarine. Then we were driven away in the truck, leaving the submarine behind us. The flat plains of Argentina lay about us and the stars glittered brilliantly. Kammler looked at me and smiled. Nebe pursed his lips and slept. The night passed and a pearly dawn broke and then we reached Bahia Blanca.

The airfield was heavily guarded. The plane's engine was already running. The truck pulled up at the hold of the plane and the crate was unloaded. General Kammler climbed in first. I let Nebe go ahead of me. I glanced briefly around the airfield, at the troopers and barbed wire fences, at the flat plains that stretched out to the sky, and then I boarded the plane. The doors of the hold were closed. The steel locks made a clanging sound. I sat down beside Kammler and Nebe and stared up at my large crate. Then the plane roared and shook. It taxied slowly along the runway. Then it roared even louder, raced along the runway, jolted, leapt off the tarmac, and climbed into

the sky.

Perhaps I slept then. I do not remember the flight. I remember Nebe's dark, depthless eyes and the plane's constant rumblings. It did not take very long. My spinning thoughts destroyed time. Kammler smiled when the wheels touched down again and the crate bounced a little. I reached out and steadied it. The plane shuddered and stopped. The doors opened and a bright light rushed in and brought with it the shocking cold.

All white. Everything. The frozen wilderness stretched out before us. I stepped down and my boots sank into snow and I breathed the pure, icy air. We were on a modest airstrip. Our own plane was waiting for us. We transferred the crate to this plane and then clambered in after it. The doors closed behind us. The plane's skis chopped through the ice. We took off and flew above the white wilderness and headed inland. All white. Everything. The plains and mountains were as one. My impatience was a hand upon my heart, my exultation was boundless. Then at last we dropped lower. I saw the enormous, encircling plateaux. We flew down below the mountains, below the glittering ice peaks, and then the great caves opened out to embrace us and carry us home.

Here we are and here we stay. The ice glitters in the sun. History changes and the world surrenders to us. We are here. We exist.

CHAPTER THIRTY-THREE

Stanford arrived early, deliberately so. Slowing down at the crossroads, just before the proposed meeting place, he turned off the road and drove between the trees, comforted by the darkness and moonlight, feeling safer that way. He stopped the car, turned the lights out, killed the engine, took a deep breath, then looked out at the darkness, glancing up at the sky, half expecting, as he always did these days, to see glowing lights merging. When had Epstein disappeared? November 1977. Since then, a whole year had passed and a new year was dawning. Stanford shivered at the thought of it. He didn't think he would survive it. Reaching into the glove compartment, he pulled out a pistol, checked it, then got out of the car and closed the door, taking great care to be quiet about it.

The sky over Virginia was starry. There was no wind at all. Stanford could smell the wet grass and felt the chill in the air, marvelling at how soothing it was after the furnace of Paraguay. He checked the pistol again, checked the time, shivered briefly, then he walked back through the trees to the road, his eyes scanning from left to right.

The road was still deserted. Stanford studied the sky again. He grinned automatically, more self-mocking than amused, thinking of himself as a fugitive and wondering how it had come to this. The road remained deserted. Stanford checked his wristwatch. Satisfied, he went down on one knee on the grass behind a thatch of densely tangled brambles. The surrounding hills were covered with trees. He remembered Epstein in Mount Rainier. His lips tightened as he stared along the road and heard a sound in the distance.

Fuller was on time. He had always been reliable. Stanford got up off his knee, but stayed low as he cocked the pistol, seeing the lights of Fuller's car emerging from the darkness. The road was flat and straight. The car approached the crossroads. Stanford held his breath as the car slowed down and then stopped, its engine still ticking over. Fuller flashed his headlights twice. Stanford let his breath out, then looked along the road, past Fuller's parked car. He saw nothing else coming. Fuller flashed his lights again. He was expecting a response. Turning away, Stanford loped back through the trees, cutting around in a circle. He emerged behind Fuller's car and checked that there was no one else in it. There wasn't. That relieved him somewhat. He stepped out from the trees, the pistol heavy in his hand. Walking up to the car, he bent down and hammered lightly on Fuller's window with his knuckles. Fuller rolled the window down and looked up and saw the barrel of the gun in his face.

'Stanford?'

'That's me.'

'What the fuck are you doing? You asked me to meet you and I'm here. What's the fucking gun for?'

'Are you alone?' Stanford asked.

'What the hell do you think? Take a good look. You've got eyes in your head. I'm all alone, for chrissake!'

'Get out of the car,' Stanford said.

'I don't believe this,' Fuller said. 'I came here because you asked me – and now you're sticking a gun in my face. Have you gone fucking crazy?'

'I'm sorry,' Stanford said.

'We're old buddies, for chrissake!'

‘I’m sorry. I’m a little bit nervous. Now get out of the car.’

Fuller sighed and rolled his eyes, killed the engine and headlights, clambered out and raised his hands in the air as if begging for mercy.

‘You must have lost your fucking marbles,’ he said. ‘Who the hell do you think you are? Elliot Ness? Get it out of my face.’

‘This way,’ Stanford said.

‘It’s a joke,’ Fuller said. ‘He drags me out of my bed to stick me up. An old buddy from way back.’

Stanford waved the pistol gently. ‘I’m not joking,’ he said. ‘If I have to use this pistol, I’ll use it. Over there. Through the trees.’

Fuller sighed and shook his head, not believe what was happening, forced a grin and then sauntered across the road to the trees, Stanford’s pistol prodding him on when he appeared to hesitate.

‘In here?’ Fuller asked.

‘That’s right,’ Stanford said.

‘It’s a picnic,’ Fuller said. ‘A midnight treat. I can’t fucking wait.’

Stanford kept the gun on him, still liking him, not trusting him, not capable of trusting anyone anymore, not even his oldest friends.

‘Can I stop now?’ Fuller asked.

‘Yes, you can stop now.’

‘I take it that’s your car,’ Fuller said.

‘That’s right. Get inside.’

Fuller sighed again, ran his fingers through his gray hair, opened the door and lowered himself onto the front passenger seat, his broad body looking cramped in that small space. Stanford went around the front, keeping his pistol aimed at the windscreen. He opened the door and slid into the driver's seat, the pistol still aimed at Fuller.

'Where are we going?' Fuller asked.

'Nowhere,' Stanford said. 'We'll just sit there and have our little talk and then I'll let you go home.'

'You're real generous,' Fuller said.

'I'm sorry,' Stanford said.

'My old buddy's sorry,' Fuller said. 'I feel better already.' He was a big man, all muscle, his face as rough as they come, and he ran his fingers through his hair again, his grey gaze focused straight ahead. 'Okay, I'm impressed,' he said. 'We're sitting here in the middle of nowhere and you're pointing a gun at me. What the fuck's going on?'

'It's the UFOs,' Stanford said. 'I want to talk about the UFOs.'

'I figured that,' Fuller said. 'You always do. Only the pistol is new to me.'

'I've had a bad year,' Stanford said. 'I have the impression I'm being followed. My apartment's been turned over twice, my phone's been cut off, and a hit-and-run driver smashed my car… I just don't feel too safe.'

'This is a pretty dangerous country,' Fuller said. 'I thought you understood that.' He glanced down at the pistol, shook his head in mock despair and grinned laconically. 'I'm putting my hand in my pocket,' he said. 'It's not for my own weapon, believe me. I just need some chewing gum.'

Stanford nodded his permission. Fuller pulled out some gum. He unwrapped

it and popped it into his mouth and proceeded to chew.

‘So,’ he said, ‘you’re nervous. You’re being harassed. And you think we’re the bogeymen.’

‘That’s right,’ Stanford said. ‘Those are CIA trademarks. You bastards have been following us since we went to the Caribbean, since we told you about Gerhardt’s abduction. You accused us of lying.’

‘Us?’

‘Me and Epstein.’

‘Epstein’s gone.’

‘Correct. Epstein’s gone. And you haven’t done a damned thing about it.’

Fuller talked while chewing on his gum. ‘What the hell could we do? You say your friend’s been abducted by a UFO and expect us to wear it. It was too much to ask.’

‘Why?’

‘Don’t talk shit,’ Fuller said. ‘You come up with a story like that and you can’t *expect* much.’

‘You believed me,’ Stanford said.

‘That’s crap,’ Fuller said.

‘You’ve known me too long *not* to believe me… You know I don’t invent things.’

‘Your story was ridiculous.’

‘Then where’s Epstein gone? He’s been missing for over a year and you guys

haven’t asked a single question.’

‘It’s a police case, Stanford.

‘Police case, my ass. I told the cops and they laughed me out of the station and forgot the whole thing.’

‘What the hell did you expect? You said a UFO abducted your friend. You came on like a crank in a gaberdine, so of course the cops giggled.’

‘Fine,’ Stanford said. ‘But Professor Epstein’s still missing. He’s a pretty important name and now he’s gone and no one seems to be bothered. I think that’s pretty strange. I mean, it doesn’t make sense. A well known scientist disappears for a year and you guys don’t bat an eyelid. That strikes me as strange.’

‘So, he’s missing,’ Fuller said. ‘A lot of people go missing. He was an old man, he was on his last legs, and now he’s probably dead somewhere.’

‘I was there,’ Stanford said.

‘Yeah, I know. You saw a UFO take him.’

‘You believe me,’ Stanford said. ‘I know that much. That’s why you’re not looking for him.’

Fuller stopped chewing his gum, stared at Stanford not grinning, then he started chewing the gum again, his jaws working methodically.

‘So,’ he said, ‘we’re at an *impasse*. What the hell are we talking for?’

Stanford watched Fuller carefully. His old friend was like a stranger. The pistol was steady in Stanford’s hands and he was ready to use it.

‘You believe me,’ Stanford said. ‘You believed me then and you believe me now. You’ve been tailing me and you know what I found out and it’s making

you nervous.'

'Oh?' Fuller said. 'And what was that? Just what did you find out?'

Stanford felt hot. He wanted to roll the window down. He was frightened to roll the window down because of who might be out there. His eyes flicked left and right. Realising what he was doing, he felt foolish. Licking his dry lips, he put the pistol in his left hand, wiped his sweaty right hand on his trousers, then transferred the pistol again, all the time keeping it pointed at Fuller. His former friend, his old CIA pal, could no longer be trusted.

'The saucers exist,' he said. 'You've known about them for years. You have your own, but you're keeping them quiet for political reasons. There are other saucers as well. They're extraordinarily far advanced. They represent a threat to this country and so you're running a race with them. You're frightened of those saucers. You're frightened of public opinion. You don't want word about them to leak out and lead to mass hysteria. Those saucers are very powerful. The people who made them are very powerful. They have weapons we can scarcely imagine and they're willing to use them.'

Fuller raised his eyebrows. 'I don't believe this,' he said. 'I think maybe I'm not hearing too good. My old buddy's gone crazy.'

'You have your own,' Stanford said. 'There's no point in denying it. The original prototypes came from Germany, you've been building your own for years, the work was carried out in White Sands and the wilds of Canada, but now the folk who built the original saucers are displaying anxiety.'

'I don't believe this,' Fuller repeated.

'You believe it,' Stanford said. 'You just want to keep it quiet. You killed off Project Blue Book, you harassed all our best researchers, and you've deliberately spread confusion through rumor for the past thirty years. You knew you couldn't keep it secret – you could just confuse the issues – so

when anything leaked out you just twisted it and wrapped it in myths. Take Cannon AFB. Take Deerwood Nike Base. Take Holloman and Blain Air Force bases and then tell me they're rumors. They weren't rumors, Fuller. The saucers seen there were your own. People talked and you let the talk lead to tales of extraterrestrials. But the ETs don't exist. Something far worse exists. It's a bunch of wizards down in the Antarctic, and you know all about them.'

'The Antarctic?' Fuller said.

'You're not so innocent,' Stanford said. 'There's a bunch of brains in the Antarctic, they created the original saucers, and now they're so advanced you can't touch them and the government's shit-scared.'

'This is crazy,' Fuller said.

'No, it's not,' Stanford said. 'The Antarctic's a very big place and those people are hidden there.'

'Where?' Fuller asked.

'I don't know,' Stanford said.

'No,' Fuller said, 'you don't know. You're just spouting hot air.' He shook his head from side to side, chewed his gum, looking disgusted, then stared sympathetically at Stanford and shook his head again, wearily. 'What horseshit,' he said. 'I mean, I thought you had more sense. That's one of the oldest stories in UFO mythology – and one of the worst.'

'What story?'

'Fucking holes in the Poles. UFO bases in Antarctica. Underground cities beneath the ice… Atlantis. Lemuria.'

'I've heard the stories,' Stanford said. 'I never believed them for a second…

But then I never believed in the saucers either. It turns out I was wrong.'

'So they come from the Antarctic?'

'So you admit that they exist?'

'We don't have flying saucers,' Fuller said. 'And neither does anyone else.' He tried to grin at Stanford. It was not a successful grin. 'Let's assume they're in the Antarctic,' he said. 'At least I might be able to correct you that way.'

'They're in the Antarctic,' Stanford said. 'They're in underground plants. They're the same as the hidden factories of Nazi Germany, and they're under the ice.'

'That's ridiculous,' Fuller said. 'You can't get beneath that ice. Don't give me that Hollow Earth garbage. That's a theory for idiots.'

'Is it?'

'You know damned well it is. There aren't any holes at the Poles. Don't talk like a crackpot.'

'I don't know,' Stanford said. 'What about the ESSA 7 satellites? The photos taken by those satellites caused a sensation.'

'It's beneath discussion,' Fuller said.

'Tell me anyway,' Stanford said.

'You're a scientist. You know the facts well. I don't have to tell you.'

'Tell me anyway,' Stanford repeated.

Fuller shook his head wearily. 'Okay,' he said. 'You want to play games, we'll play games. I'll tell you about the photos that conned all the fucking

UFO freaks.' He took out some more gum, unwrapped it, studied it, then popped it into his mouth and started chewing, looking disgusted. 'Those famous NASA photos were released to scientific journals, most of whom could have been expected to understand them. Unfortunately, and as usual, the ESSA 7 satellite photos found their way into the hands of certain commercial writers. The enormous holes in the Poles, so clearly shown on the photos, were described, through what can only be termed ignorance, as being just what they looked like: goddamned holes in the Poles.' Fuller shook his head sadly, chewed his gum, glanced around him, saw nothing but the darkness beneath the trees, so turned back to Stanford. 'Of *course* they weren't holes,' he said. 'You know that as well as I do. Those photos were obtained by onboard Vidicon camera systems, and as such were not normal pictures. They were, in fact, photomosaics. They were reproduced from the processing of the signals from a lot of television camera frames obtained over a twenty-four hour period. Those signals were processed in a computer and transformed into a polar stereographic map projection with latitude, longitude and the outlines of land areas superimposed electronically. The areas in which camera frames were missing – due to the fact that the pictures were taken during the dark polar winter and the ESSA 7 camera systems lacked infrared facilities – were shown in solid black or white, which accounts for the famous "black holes". However, current polar-orbiting satellites use a two-channel radiometer instead of the Vidicon camera system, and this radiometer is sensitive to energy in both the visible and infrared spectrums. If you, being the ignorant scientist you're so obviously pretending to be, care to return to my office I'll show you the same polar stereographic satellite images from the NOAA 5 satellite in which the visible channel data over the Poles during the polar winter shows holes at the Poles – whereas the *infrared* channel data for the same period shows the land as it actually exists. There are no holes in the Poles and you know it, so let's fucking drop it.'

Stanford knew he was right. He just wanted him to talk. He wanted to loosen Fuller's tongue before he pulled his ears off.

‘Okay,’ he said, ‘let’s change the subject. What do you know about Admiral Byrd?’

‘Oh, Jesus, saints preserve me,’ Fuller said.

‘Just tell me.’

‘I’m going crazy. My ears are playing tricks. We’re in the land of the loonies.’

‘Tell me,’ Stanford insisted.

‘Just ask me,’ Fuller said. ‘My imagination doesn’t stretch as far as yours. I can just about answer you.’

Stanford didn’t smile. He kept the pistol aimed at Fuller. Just occasionally he glanced out of the car, scanned the dark, silent forest.

‘Okay,’ he said. ‘Accepting that there’s no enormous hole at the South Pole, the next major UFOlogist theory is that the land around the Pole dips down considerably, forming a sort of giant doughnut, and that this land mass is therefore greater than we commonly think it is and could actually be a lot warmer than the surrounding Antarctic.’

‘Right,’ Fuller said sarcastically. ‘And being so immense, hidden from us and pretty warm, that land could be fertile and inhabited: the home of your saucer people.’

‘It’s possible,’ Stanford said.

‘It’s *not* possible,’ Fuller said. ‘You’re going to quote Admiral Byrd’s remarks about a continent in the sky.’

‘Right,’ Stanford said. ‘It’s been widely reported that Admiral Byrd penetrated a land extent of two thousand and three hundred miles *beyond* the

Pole and saw a land mass reflected in the sky. Okay, since we now know about Antarctic conditions, we can assume that it *was* a reflection.'

'Or a mirage,' Fuller said.

'Or a mirage. That still begs the question of how, given where Byrd turned back, he could have reported two thousand and three hundred miles *beyond* the Pole.'

'He didn't,' Fuller said. 'The origin of that figure is a mystery; it didn't come from Byrd. Go to your newspaper morgues and you'll that the actual stated figure was a journey covering approximately ten thousand square miles, with only *one hundred* of those miles beyond the Pole. As for the "Great Unknown beyond the Pole", that statement – which the UFOlogists have picked up as solid proof for their "hidden continent" theory – is merely the understandable remark of a man who was, in 1947, looking for the first time at a land mass that hadn't yet been explored. The "Great Unknown" was simply the Great Uncharted – but it *has* been crossed and photographed since and is no longer "unknown".'

Stanford started to speak, but Fuller waved his large hand, now involved in what he was saying and determined to finish it.

'Let me continue while I'm eager,' he said. 'I can't bear your sweet ignorance… It should be noted, regarding Byrd's *other* much abused remark about that "enchanted continent in the sky," that Byrd *also* stated that during the flight both he and his crew had no oxygen equipment, that they were suffering from anoxia, and that they were therefore not quite themselves – a point conveniently ignored by your UFOlogists. As for the "enchanted continent in the sky" being a reflection of a land mass not covered in ice, this isn't as extraordinary as the UFOlogists pretend it is. There are, in fact, and contrary to the assertions of many UFOlogists, many well known ice-free areas in Antarctica – and any one of those could have been the reflection, or mirage, viewed by Byrd. Another popular so-called "fact" is that there are no

volcanoes in the Antarctic and that the dust sometimes found there must therefore come from the “hidden” continent. That’s a neat theory except for one thing: there *are* volcanoes in Antarctica.’

Fuller grinned and chew his gum. Stanford inched closer to him. The pistol was still steady in his hand and he felt pretty high.

‘Okay,’ he said. ‘That gets us right to my point. I just want to clear up a little matter and then we’ll call it a day. There are lakes in the Antarctic. There are also ice-free areas. There are mountains and volcanoes, the ice can be a mile deep, and it’s believed that the ice below the surface is actually joined to the sea. That suggests certain things. It suggests hidden valleys. It suggests canyons and caves and other ice-free hidden areas in which a colony of people could exist in comparative safety. I never believed Earth was hollow. I know we’ve charted the Antarctic. But I also know that we’ve only charted it from the air and that there are vast, unknown areas. You know that the people who created and use the saucers are there. You probably know where they are. I want to know what they’re planning, I want to know just where they are, and I want all the facts right now, with no pissing around.’

Fuller stared hard at Stanford. His large body was quivering. Stanford knew he wasn’t quivering with fear, but with cold, suppressed rage. Stanford kept the gun on him. Fuller glanced down at it. He looked at it for a long, thoughtful time and then he raised his eyes again.

‘I’m getting out of here,’ he said.

‘Don’t try it,’ Stanford said.

‘You wouldn’t know how to fire that fucking thing. *Adios*, pal, I’ll see you.’

He started turning towards his door, but Stanford raised the pistol higher. He tapped the barrel against Fuller’s head, then slipped it into his ear. Fuller froze. The barrel filled his ear. Fuller sat there and stared at the dashboard

and took a deep breath.

‘You wouldn’t do it,’ he said, releasing his breath. ‘Who the fuck do you think you’re kidding? You’re a scientist. You don’t play with those things. Now get it out of my ear.’

‘I used to be in the marines,’ Stanford reminded him, ‘so I certainly know how to use a weapon.’

‘Fuck you,’ Fuller said.

‘It’s cocked,’ Stanford said. ‘Talk or I’ll blow your brains out.’

‘No way. You won’t do it.’

Fuller jerked his head away. He started opening his door. Stanford turned the pistol around, used the grip as a handle, struck Fuller across the side of the head and on the back of his wrist. Fuller’s head snapped forward, hit the dashboard and bounced back, and he grunted, his wounded hand flapping, trying to wipe off the blood. The hand dropped down to his side. His good hand swung at Stanford. The latter slapped the hand away with his pistol, then he struck Fuller’s wounded hand again. Fuller gasped and flopped forward. He remained there with his head on the dashboard, dripping blood, breathing harshly.

‘Talk,’ Stanford said.

‘Get fucked,’ Fuller gasped. ‘If you didn’t have a gun for a fist, I’d have your balls in my teeth. I’m not talking, you prick. You’ve gone too far too quickly. If you want me to talk, you’ll have to suck me off and you’re still not the type.’

‘You never know,’ Stanford said.

‘You fucking marine,’ Fuller said. ‘I forgot you were one of the tough guys

before you turned soft. Now you're just a soft scientist, Stanford. You couldn't hurt a fly.'

'I'll hurt you,' Stanford said.

Fuller tried to raise his head. Stanford hammered it with the pistol. Fuller's head cracked against the dashboard and bled even more. Stanford saw himself in action. He was standing outside himself. He hardly recognized himself anymore, now driven only by anger. His hidden self had stepped forward. He knew what the hunted felt. He was desperate and it lent him a rage that overrode his better, softer nature. He remembered the girl in Galveston, remembered beating up Scaduto, remembered his journey through Paraguay, the Ache Indians, the cold, brutal German. Yes, he had changed. He knew it now as he looked at Fuller. His old friend, now bleeding and breathing harshly, could no longer be trusted.

'Talk,' Stanford said.

'Jesus Christ,' Fuller gasped. He pressed the dashboard with his thick, hard-ridged fingers, as if trying to bend it. 'You've sure learned a few tricks,' he said.

Stanford smashed Fuller's hand. Fuller yelped and jerked upright. Stanford forced his head back down with the pistol and saw more blood flowing.

'I've changed,' Stanford said. 'I'm not a scientist anymore. I was never a good scientist anyway, but now you bastards have done me in. I won't sit back and take it. I want to get Epstein back. I don't know why it's so important; I just know that it is. I have to find Epstein. I have to know what happened to him. That old man means a lot to me now, and I don't understand it. He said I refused to make decisions, but I did so when he was abducted by that saucer. I decided to track this business to the very end and let no one stop me. Now I want you to talk. I think you'll just have to talk. If you don't talk, we'll sit here all night and I'll hurt you some more.'

Fuller cursed and jerked upright. Stanford hammered him in the stomach. He grunted and flopped forward again, his good hand on the dashboard. Stanford smashed that hand. Fuller screamed and then whimpered. He was propped up with his forehead on the dashboard, dripping blood to the floor.

‘Jesus!’ he hissed. ‘Oh, my God, fuck, it hurts! Okay, Jesus Christ, I’m fucking dying, you win, Christ, it hurts…’ He shook his head from side to side, but kept it down, staring at his own feet. The blood was dripping from his head and lips, splashing onto his shoes. ‘Okay,’ he said, ‘you’re right. It was the Second World War. The fucking Krauts built a saucer. We found components and various drawings. The British, the Canadians and us – we all found bits and pieces. It was enough to get us going. We all put our heads together. You already know most of the details, so I’ll save my breath there. The main work was done in Canada. Other work was done at White Sands. A lot of the UFOs sighted over those areas were our very own saucers.’

‘Fine,’ Stanford said. ‘I know all that. What about the Antarctic?’

Fuller groaned and shook his head. ‘It’s all on Epstein’s tapes.’

‘That was Germany,’ Stanford said. ‘You’re confused. What about the Antarctic?’

‘You went to Parguay,’ Fuller said. ‘You went to see that Nazi. We know what the old fucker told you… He told us the same thing.’

‘When?’ Stanford asked.

‘A long time ago,’ Fuller said. ‘That old vulture, he should be dead by now, but we just can’t get near him.’

‘The Antarctic,’ Stanford said.

‘He told you the background, Stanford. That was the start of it all. Those Nazis went to the Antarctic and that’s where it began.’ He shook his head

from side to side and wiped his lips. He could hardly use his hands. He groaned and let his hands fall again, his head still on the dashboard. ‘We knew they were there. Captain Schaeffer told us that much. He said they’d gone to Neuschwabenland to build flying saucers. We were inclined to believe him. We had plenty of evidence to back up what he said. We had drawings and components, and we found a few other people who talked. That’s why we launched Operation Highjump. That was in January ’47. It was a military operation disguised as an exploratory expedition, and its true purpose was to find out where the Germans were.’

‘They docked at Neuschwabenland,’ Stanford said.

‘No,’ Fuller said. ‘You can discount that myth. We had to bluff the entire fucking world and we did it with style. We circled the whole continent. We really covered that mother. We split up into three separate groups and flew all over the place. The Central Group, based at Little America on the Ross Sea, covered the area between Marie Byrd Land and Victoria Land, moving inland, in crisscrossing patterns, as far as the South Pole. Meanwhile, the East and West Groups girdled the whole continent, moving out in opposite directions and actually coming in sight of one another’s aircraft. The East Group reached the Weddell Sea. The West Group went as far as Princess Astrid Land. Some airplanes from both groups then flew over Queen Maud Land, including the area that the Nazis had called Neuschwabenland. They saw ice-caps like mountains. Their compasses went crazy. They got lost and then they saw some flying saucers that appeared out of nowhere. The flying saucers buzzed them. The planes’ ignition systems malfunctioned. Four of the planes went down and the others flew away, making their escape, and the crews then told Admiral Byrd about it. The expedition was cut short. The official explanation was hurricane winds. Byrd returned to America and made some indiscreet statements. We told him to shut up, we killed all talk of the flying saucers, and we decided to treat the Antarctic with considerable care. About three months later, in June 1947, we tested our own saucers over Mount Rainier in the Cascades – and then the saucers we had seen in the

Antarctic paid their visits.'

'How did you find out where they were?' Stanford asked.

'We didn't. They found us. They started to play tag with our jets and airliners, just to show us what they could do. They hammered the point home by harassing our top-secret test centers and driving our interceptor pilots nuts. After three years of this there was no doubt in our minds about who those flying saucers belonged to. Naturally, we kept quiet about it; we were shit-scared of panic. We killed off Project Grudge, tried to ridicule all sighting reports, and generally confused the whole issue to turn it into a myth. For the most part this worked. It also worked for our *own* saucers. The Lubbock sightings, for instance, were sightings of our own saucers – and a lot of other sightings were the same.'

Fuller kept his head down. He was bleeding less now. He talked like a man in a trance, his breathing not so harsh.

'They approached us in 1952,' he said, 'and they did it just like regular politicians, through all the right channels. The approach was made by a man called Wilson. He got in touch with the CIA. We met him and he told us his story and we couldn't believe it. Wilson soon proved it, though. He was talking to one of our top men. He already knew our man's address and he told him that the next night he would send a flying saucer over his home. The CIA chief lived in Alexandria, Virginia, he was having a garden party on the night in question, and during that garden party both he and his guests saw a UFO directly over the house.'

'That was when the Director of Intelligence, General Samford, called Captain Ruppelt to a secret meeting in Washington, DC.'

'Right. But Ruppelt didn't know about that Antarctic colony – and we never told him.'

‘So, why the meeting?’

‘After the UFO sighting over the CIA chief’s home, he had another meeting with Wilson. Wilson told him more about the colony, told him what they were capable of, and then said that he didn’t want any interference and would trade with the US. Apparently, even with *his* awesome genius and his hundreds of slave workers, he was in constant need of various mass-produced components and equipment. His idea, then, was to form a clandestine partnership with the US, trading certain innovations of his technology in return for what he required to advance the same. A seesaw arrangement, right? A trick maneuver. But that’s what he wanted.’

‘And?’

‘He was asked what would happen if we decided to say no, and he pointed to various disasters, on land and sea, that we had not, at least up until he told us, been able to explain. Wilson explained them. He told us that he had caused them. We still didn’t believe him, so he told us that his saucers would invade Washington, DC. When they did, we believed him.’

‘That, also, was in 1952.’

‘Yes.’

‘And the meeting between Captain Ruppelt and General Samford?’

‘That took place after Wilson had told us about his planned invasion. Samford never told Ruppelt anything about Wilson, but he wanted to know about the extent of the UFO sightings. Not knowing about our conversations with Wilson, Ruppelt confirmed that there’d been a massive build-up of UFOs around DC throughout that whole month. He also made it perfectly clear that he was expecting a UFO invasion over the capital. That invasion came, we decided to sit tight, and one week later the saucers came back and we had to tell President Truman.’

‘And then you came to an agreement with Wilson.’

‘Right. But first we formed the Robertson Panel. The purpose of that panel was twofold. The first task was to convince the public that a proper scientific body had investigated the UFO phenomenon and found it to be fucking nonsense. Also, regarding this, it was our intention right from the start to use the panel’s recommendations as an excuse for suppressing all UFO reports. I think you know how we went about it…’

‘Yes,’ Stanford said.

‘Okay. The second and equally important function of the panel was to examine what Wilson had told us and shown us, and to assess his viability as a threat to the nation. Our assessment was that his technology was so far advanced, it constituted an unprecedented threat to the nation – and probably the world. It was therefore decided to come to an agreement with him.’

‘I see,’ Stanford said. ‘So that would explain why the Robertson Panel was made up of men specializing in atomic research and advanced weaponry, why it was chaired by a CIA-classified employee, and why it included Lloyd Berkner, who’d accompanied Admiral Byrd to the Antarctic in 1937.’

‘Yes. It also explains why, when Ruppelt found out that the UFOs were intelligently controlled, we had to get rid of him.’

‘And anyone else who was like him.’

‘Right.’

‘Then you made your agreement with Wilson.’

‘We did. The agreement, simply put, was that we’d have a step-by-step trade, negotiating as and when required for what we both wanted. What Wilson wanted was access to our mass-production industries – and what we wanted was everything he knew. Naturally he didn’t buy this. Instead, he fed us a

spoonful at a time. And with neither side trusting the other, we built up a relationship. That relationship gradually grew more complex. Like all relationships, it had its faults. And the biggest was that Wilson was also trading with our good friends, the Russians.'

'He played one against the other,' Stanford said.

'Yes,' Fuller said. 'He's still at it right now. We all trade, we all lose. We keep trying to catch up with his technology, but he always manages to keep just ahead of us. So now the pattern's changed. We're all creeping across the Antarctic. The Antarctic is a vast, untapped treasure-house of oil, coal, gold, copper, uranium and, most important, water. The whole world now needs water. Ninety percent of all the world's water is in the Antarctic. In short, the Antarctic is where the future of the world will be decided, so we just can't keep out of it any longer. We all pretend it's not political, that we're just there for research, but the logic, or lack of logic, in politics is leading straight to a clash.'

'It's political leapfrog,' Stanford said.

'That's right. A kid's game. But somebody's going to trip up and get hurt – and then all hell will break loose.'

'Are they Nazis?' Stanford asked.

'No,' Fuller said. 'They're a society of masters and slaves, but they're no longer Nazis. That Wilson is a genius. His genius extends to organization and so he runs that whole place. He's into parapsychology, electrodes and prosthetics. He has his people implanted when they're born, and they grow up like zombies. There's never more than a thousand of them. The system is based on euthanasia. When someone ceases to be of any use, Wilson has him put down. There's no possibility of resistance. They're all disciplined with electrodes. They all exist just to work, and that work is for the glory of science. Human beings are vivisected. What he doesn't have, he steals. We

know he steals people from us, but we discreetly ignore that fact. We can't afford to rock the boat. We have to stay on the seesaw. That colony represents the balancing power and we just can't catch up with it.'

'So the Americans and Russians actually work with him?'

'In truth, he's what we need. The whole world's out of control. We all need what that bastard has, but he's buried down there. So, we continue trading. He lies to us, we lie to him. We keep building more satellites, pulse beam weapons, more powerful saucers, and we think that in a couple of years we might be ready to tackle him. The Russians think the same. Wilson knows what we're both thinking. When we slip up, he demonstrates his technological superiority and then we promptly correct ourselves and back down. It's like I said: it's a seesaw arrangement, a tricky maneuver, but sooner or later it's bound to explode – and I don't like to think of that.'

'So,' Stanford said. 'This explains the secrecy about UFOs. It also explains why the Russians and Americans cooperate in the Antarctic.'

'You've hit the nail on the head, pal.'

Fuller carefully raised his head, lay it back against his seat, then just sat there, breathing deeply with relief, gazing into the darkness.

'Where are they?' Stanford asked.

'Don't even think about it,' Fuller said. 'You go there and you'll never come back, and that's all there is to it.'

'Where *are* they?'

Fuller sighed wearily. 'They're in Neuschwabenland. You fly along the zero meridian, straight in to Queen Maud Land, and about two hundred miles in from the coast, you'll find a range of low mountains. It's really Norwegian territory. It's really part of Queen Maud Land. You usually only find it

marked on German atlases, and they call it Neuschwabenland. The Antarctic colony is in those mountains. They've hollowed out the base of the mountains. There's an area where the ice forms a huge circle that resembles a volcano. The carrying ships are down there. They come up out of there. Beneath the circle of ice is solid rock, now honeycombed with long tunnels. The tunnels lead into the colony. They all live and work there. The whole area is protected with a force field that makes unwanted aircraft malfunction. We found that out to our cost. We stopped trying years ago. That whole area is liked the famous Area of Inaccessibility – and our pilots avoid it.'

'I'm going there,' Stanford said.

'You're going nowhere,' Fuller said. 'I once like you, but you can't walk away with this. Understand? You're a dead man.'

Stanford suddenly heard the noise. Glancing out automatically, he saw bright light flashing on and off the trees, beaming down through the darkness. Then Fuller made his move. Stanford turned back and saw him. Fuller had opened his door and was falling backward, one hand inside his jacket. The pistol bucked in Stanford's hand. Its bang was deafening in the car. Fuller cried out as his body struck the ground, but then he quickly rolled over. Stanford dropped across both seats, heard the roaring helicopter, saw Fuller rolling away from the car, a pistol clenched in his right fist. Stanford fired and Fuller jerked, dropped his pistol and flopped over. Stanford sat up and turned the ignition key as the roaring grew louder.

He didn't bother closing the far door. A cloud of dust and stones swept over him. The chopper roared descending over the trees and bathed the car in its fierce light. Stanford cursed and put his foot down, reversed, the wheels squealing, shot forward and made a tight turn as Fuller staggered toward him, swaying weakly from side to side. Stanford couldn't avoid him. He heard a sickening thud. Fuller bounced across the hood of the car, limbs akimbo, his eyes large, mouth wide open, waving frantically and rolling off again. Stanford put his foot down harder, racing straight at the trees, swinging the

car wildly from left to right and staying away from the road.

First the darkness, then the light: the helicopter was right above him. It came down above the trees, whipped the dirt up, swirling and hissing. Stanford wrenched at the steering wheel. He hit a tree and bounced off. The car shrieked and then shot forward again, crashing through the undergrowth. The chopper roared and deafened Stanford. It was just above the trees. It was whipping the dirt up to his right and forcing him back to the open road. Stanford cursed and kept going, weaving left and right frantically, tearing branches and bark from tree trunks, the car howling dementedly. He managed to keep away from the road. The forest suddenly opened out. The roaring chopper descended into the clearing and smashed the car with its skids. The impact blinded Stanford, made him release the steering wheel. The car shot off to the left and started skidding and he grabbed at the steering wheel again. He went with the skidding, shrieked around in a full circle, was blinded by the chopper's glaring lights, almost choked in the dust. The car raced toward the chopper. The chopper jerked up and shuddered. A rotor snapped against the branch of a tree and flew away as the chopper tipped over. The car raced right beneath it, shot back into the forest, was shaken by a thunderous explosion, bathed in fierce, jagged lightning. Stanford managed to glance back. A ball of fire filled the clearing. The fire swept across the field and up the trees, its flames hissing and spitting.

Stanford turned the steering wheel, heading straight for the road. He bounced back onto the road, took the fork to Washington, DC, glanced across the road and saw the burning trees illuminating the forest. The flames soon dropped behind him. He slowed down and drove more carefully. He saw the dark night on all sides, the moon, the glittering stars, and he knew that he would have to leave the country and never return.

CHAPTER THIRTY-FOUR

Awakening in that bitterly cold dawn of January 28, 1979, still not believing where he was, Stanford shivered and closed his eyes again and thought of how he had come here… He saw the harbor of Manzanillo on the western coast of Mexico, the one hundred and twenty-five-foot ship, its wooden hull creaking rhythmically, moving out in the gray, early-December afternoon, its engines and generators and air-conditioners filling his ears with a muffled roaring. Then due south to Easter Island, the turgid waves rolling slowly, the frigate birds sailing by on their fluttering black wings, the swarm of Galapagos storm petrels like a cloud of locusts. Blue-gray flying fish, the sea's monotonous rise and fall, the sun rising as orange fire, turning into a dazzling white, the pink sunset, then sharp, abrupt darkness, the stars glittering in velvet sky. The gradual death of December. The dawn an eerie green glowing. The sun forming an arch, stretched across the horizon, first green and then turning to red and setting the clouds on fire. The clouds shifted and changed, tinged with pink and orange-yellow, touched here and there with glinting gold, the sea violet, languorous. America was no more. Other worlds were now beckoning. The South Pacific, Cape Horn, the seas rough and uninviting, flocks of whalebirds with blue and white plumage, then the Tropic of Capricorn. White-breasted, dark-backed shearwaters, gliding through the troughs of waves, the southern latitudes with their long ocean swells, the smaller waves in between. The great wings of albatross, their graceful soaring and gliding, then past the southern coast of South America, rain and fog, the winds moaning. Buoyant Magellanic penguins. More birds high and low. The barren, forbidding rocks of the Ildefonso Islands, the Beagle Channel, its dark, humpbacked islands, brown and bleak and forlorn.

Then the New Year coming in, the sea foam-flecked and grim, giant petrels and skuas overhead, the cold winds unrelenting. Farewell to the Old World. No escape from the future. The primeval forests and glacier-encased peaks of Tierra del Fuego. Then the stormy Drake Passage, the current driven by the westerlies, waves fifty to a hundred feet high, the green water smashing over the bow and sweeping back out again. The New Year, a new person: Stanford losing himself. Over the Antarctic Convergence, past Elephant Island, great blocks of rock and ice, flashing ribbons of snow, a shroud made of smokey, drifting cloud, a sudden upthrusting glacier. Time passing and then stopping. Stanford's gloved hands on the railing. Then the ice-encased mountains, seals and whales and pelagic birds, the air brilliantly clear, the cascading ice blue, the mountain ridges of Gibbs Island, the penguins circling the ship, the crevassed ice cliffs sliding past as if not really there. Stanford's gloved hands in the air. A bird fluttering on the deck. More islands, more snowbanks, penguins crowding on the rocks, Greenwich Island, high waves exploding fiercely, the spray cascading and settling. Then a white line in the distance. The approaching Antarctic Peninsula. Then the glaciers and icebergs, huge umbrellas and arches, flat islands of sea ice, the grottoes and canyons and fjords reflecting sun on the green sea. A world like no other. Silent, Majestic. Sweeping plains of packed snow, soaring peaks of glittering ice, the peaks yellow and pink and sometimes black, a blue sheen over all… Stanford opened his eyes again. He looked around him and shivered. He was now at the bottom of the world and could scarcely believe it.

He sat up on his bunk, yawned and blinked, glanced around him, saw that the other bunks were already empty, the Norwegians out at their work. He sat there for some time, staring through the window opposite, seeing nothing but the wall of the dome that surrounded the base. Stanford still felt stunned. He had finally arrived. He swung his legs off the bunk and stood up and hurriedly dressed himself.

The Nissen hut was long and bleak, a converted army barracks, the blankets rumpled on the bunks, clothes and boots scattered all over the place, the walls

covered in pinups. Stanford zipped up his jacket, shivered again as he picked up his gloves, then he walked along the hut, between the bunks, and entered the washroom. He splashed water on his face, combed his hair, put his hat on, made sure that his ears were well covered and then looked in the mirror. A stranger stared back at him, a long-haired, bearded man, his eyes uncommonly hard and intense and possibly mad. Stanford wondered about that. The possibility didn't bother him. Then he turned away and left the hut and looked around the Norwegian base.

The whole camp was inside an enormous, glittering geodesic dome that shielded it from the wind and snow. Beneath the dome were mess halls, administration huts and accommodations, power plants and machine shops and garages. All the buildings were painted red, were square and rectangular, took the form of cylindrical Quonset huts, and were made of corrugated steel. The generators were whining, the power plants hummed steadily, as Stanford passed the research laboratories for meteorology and atmospheric physics, the library and medical center and radio masts, and stopped in front of the mess hut. He glanced directly above him, at the immense, glittering dome, then slapped himself to get warm and entered the mess hut for a strong cup of coffee.

It was a self-service canteen, the food stacked behind glass, plastic trays piled up beside the metal urns and the white cups and plates. Stanford poured himself a coffee, studied the food and decided against it, turned away from the steel-framed glass cabinets and looked around the mess hut. Most of the tables were empty, the men already out at work. He saw the pilot at a table near the wall, a steaming mug at his lips.

Stanford went to join the pilot, wending his way between the tables, a pulse beating nervously in his stomach, feeling bright but unreal. The pilot looked up and grinned, wiped some coffee from his beard, his hair, just like Stanford's, long for warmth, a wild gleam in his eyes.

'Hi, ho,' he said. 'How's my buddy? He don't look too good.'

Stanford pulled a chair out, sat down facing the pilot, noticed that his pupils were enlarged and did not feel encouraged.

‘I’m fine, Rocky,’ he said. ‘Just wind me up and I’ll go. One coffee – just this single cup of coffee – and my day will begin.’

Rocky grinned and scratched his beard, inhaled luxuriously on his cigaret, blew the smoke to fill the chilly air with the sweet aroma of pot.

‘Oh, my,’ he said. ‘Beautiful.’

‘You’re stoned,’ Stanford said.

‘Damned right, I’m stoned,’ Rocky said. ‘A man needs a good breakfast.’

Stanford shrugged and drank his coffee, let it burn down inside him, neither angry nor pleased with the pilot, knowing what he was like. Rocky was a freelance, working on commission for the Norwegians, a kid with scrambled brains and experience in Vietnam and the ability to fly just about anywhere, under any conditions. The Norwegians called him the Mad Bomber. He lived up to his reputation. He would do things that no other pilot would do, which is why Stanford wanted him. The other pilots avoided Neuschwabenland. It was officially forbidden to fly there. Learning that fact pretty quickly, Stanford had thought he was sunk. Then he heard about Rocky. He started to get stoned with Rocky. He told Rocky where he wanted to go and Rocky giggled with pleasure. Rocky liked the forbidden. He was just out for kicks. They had scrambled his brains in Vietnam and now he lived like a wild man. Still, he could fly. He had his own airplane. It was an old transport plane with skis attached, and Rocky knew how to handle it. He had loved the idea of this particular flight, had wanted to see them goddamned UFOs. He had, like everyone else in the Antarctic, seen them flying around. Now he had the chance to see them up close and he couldn’t wait to get out there. Rocky wanted to go down in a blaze of glory, stoned out of his skull.

‘What’s it like outside?’ Stanford asked.

‘Minus fifteen degrees. I hope you’ve got your balls wrapped in velvet – you might lose them out there.’

Rocky grinned and scratched his nose, inhaled some more pot, the pupils of his eyes extremely large, hiding dangerous dreams.

‘Can you fly?’ Stanford asked.

‘Zip your lip,’ Rocky retorted. ‘I could fly that fucking airplane through a pinhole with a girl on my cock.’

‘You must have tried it,’ Stanford said.

‘That’s my secret,’ Rocky said. ‘Finish your coffee and let’s get out to the plane. I don’t want them checking us.’

‘What did you tell them?’

‘That we were flying to Cape Norvegia. I said we were picking up some supplies, and the dumb bastards believed me.’ Rocky giggled at the thought of it, finished his smoke and stood up, looking bulky in his boots and padded clothes, a pair of gloves in his right hand. ‘Okay,’ he said. ‘Let’s get the fuck out of here and have us a good time.’

Stanford gulped down his coffee, grabbed his gloves and stood up, then he and Rocky left the mess hut and headed straight for the airstrip. Stanford repeatedly glanced around him, still not used to being here, the geodesic dome soaring above him, sunlight pouring down through it. They passed the power plants and garages, then a line of snow tractors, cut around a cylindrical Quonset hut, approached a door in the curved wall. They both put their gloves on. Stanford followed Rocky out. His boots sank into the snow, the bright light stung his eyes, then the cold clamped around him like a vice and rushed into his lungs.

Ice. All ice. Hills and valleys made of ice. The sun was brilliant and it flashed off the ice and the light almost blinded him. It was incredibly beautiful. It nearly took his breath away. There was nothing out there but the ice and the dazzling white light. The ice went out to the horizon. The sky was sheer blue. He looked up at that sky and saw a green field surrounded by more ice. The sky acted as a mirror, reflecting the land below. The green field was an ice-free mass of land many miles to the west. Stanford looked all around him. The view never failed to stun him. The ice was everywhere – at his feet, up in the sky – and looking at it, he thought it was beautiful and mysterious and frightening.

They walked together across the snow, both bulky in their heavy clothing, exhaling clouds of steam, a light frost already forming on their beards, the gloves protecting their hands. The airstrip was fairly close, nestling under a towering ice cliff, its lowest peak two hundred feet above the airplanes, the sky a white haze above.

‘Fucking crazy,’ Rocky said. ‘I can’t believe we’re actually doing this. I mean, you say we’re gonna see some flying saucers, and that’s it: we’re off. We must both be fucking mad. You must be as mad as me. What the hell are you gonna do when you see them? Just answer that question.’

‘I’m going in there,’ Stanford said.

‘From what I’ve heard, that would be nuts.’

‘You can land about five miles from the mountain, then I’ll take the snow tractor.’

‘It’s really true, then?’ Rocky asked.

‘It’s really true,’ Stanford said. ‘All the UFOs you’ve seen were real, all the rumors you heard were true: there’s a colony hidden deep in those mountains and they’ve got flying saucers.’

Rocky shook his head with wonder. ‘Oh, boy,’ he said, ‘that’s great. That’s absolutely fanfuckingtastic and it’s blowing my mind.’ He giggled with pleasure, rolled his stoned eyes, the frost thickening on his bushy red beard, the sun flashing around him. ‘I can’t wait,’ he said. ‘What a wild fucking gig. What a story to tell when I’m old and gray. I won’t believe it myself.’

They were on the edge of the airstrip, a wall of ice towering above them, a fine snow drifting around their booted feet, their eyes watering with cold. A helicopter was taking off, its rotors whipping the snow up, its image reflected in the wall of ice as it climbed past the cliff. They walked across to Rocky’s airplane, an old and battered transport, its green fuselage decorated with pinups and obscene comments. The plane was resting on long skis, the door open, its ladder down, and a couple of men were standing in the doorway, their fur collars turned up.

‘All set?’ Rocky asked.

‘Smooth as butter,’ one of the men said. ‘But we better take off pretty quick. I think they’re getting suspicious.’

‘Norwegian shitheads,’ Rocky said.

‘They’re okay,’ the man said. ‘It’s just they’ve had a few complaints from the Russians. Those bastards said you’d been buzzing them.’

Rocky giggled and shook his head from side to side. ‘Lord have mercy,’ he said. ‘Them Russkies aren’t telling any lies. I buzzed Novolazarevskaya.’

The man in the airplane grinned. ‘That’s what you did, Rocky. The Russians said you were lower than their radar, almost pissing on top of them.’

Rocky giggled again. ‘What the fuck?’ he said happily. ‘A man needs a little action now and then to keep boredom at bay.’

‘You were stoned,’ the other man said.

‘Happy days, I was stoned.’

‘Some day they’re gonna boot you in the ass and send you back to Alaska.’

‘Some day,’ Rocky said.

He climbed up into the airplane, followed closely by Stanford, and they made their way along to the cockpit, past the yellow snow tractor. Stanford heard the ladder rattling, the door shrieking and then slamming, the sound reverberating throughout the airplane and making his ears ring.

‘Here we go,’ Rocky said. ‘You can take the co-pilot’s chair. The guys there, they’ll sit in the back and look after the tractor.’

Stanford nodded and took his chair, strapping himself in, surveying the control panel, the mass of switches and indicators in front of him, above him, to his right, the engineer’s chair behind him. Rocky coughed and pursed his lips, flicked a couple of switches, while Stanford looked out through the windshield at the alien world before him. All white. Everything. The sun flashed off the ice. The airplane suddenly bellowed and shuddered, prior to take-off.

‘There’s no air traffic control,’ Rocky said. ‘That’s the blessing of this burg. They just tell you what time you can leave, and then you get up and go. Hold on to your seat.’

The plane moved forward slowly, the airstrip running between banks of snow, a broad lane narrowing down to a pinpoint at the base of the cliff face. The cliff was covered in ice, the sun flashing off its face, the peaks sharply defined against a sky that changed from white haze to blue. The plane shuddered and roared, picked up speed, started racing, passing snow tractors and sun-reflecting radar bowls that were framed by the glistening snow. Then the airstrip was racing past on both sides, the white-faced cliff spreading outward, becoming higher as the plane rushed straight at it as if about to

crash into it. Stanford held onto the sides of his chair, took a deep breath, released it, then Rocky giggled and the plane jumped off the runway, going into a steep ascent. Stanford kept hold of his chair. The plane was shuddering and rattling. He saw the face of the cliff, the blinding eye of the sun, then the glistening white peaks passed below and the plane leveled out.

‘Jesus!’ Stanford whispered.

‘Hi, ho,’ Rocky said. ‘Nothing like a little bit of action to get rid of the cobwebs.’

The panorama was immense, a sweeping vista of pack ice, snow falls and glinting glaciers, low mountain peaks framed against a sky of unbelievable clarity. Nothing moved in that landscape, nothing broke its frozen silence; the fierce light of the sun poured down upon it and was then devoured by it. Earth and sky became one – the sky reflected the land below – and the rays of the sun were distorted to form luminous arches. All white. Everything. The towering glaciers were like prisms. The light flashed and raced outward in silvery-white lines that merged with the dazzling white snowfalls.

‘Queen Maud Land,’ Rocky said. ‘We’re flying along the zero meridian. We should reach Neuschwabenland pretty quickly, if we don’t get lost first.’

‘What happens if we keep going?’

‘We cross the South Pole. Then north becomes south, east becomes west, and we have us a smoke and say our prayers until we run out of gasoline.’

‘Don’t get lost,’ Stanford said.

‘I’ll try not to,’ Rocky said. ‘We’ll circle over the mountains, we’ll try to find that hidden colony, then we’ll turn back and land five miles away and go in with the snow tractor, just like you suggested.’

‘You’re coming with me?’ Stanford asked.

‘Damned right,’ Rocky said. ‘I’m not giving you this trip for free, pal – I want to see all them saucers.’

‘It might be difficult,’ Stanford said. ‘There’s supposed to be a force field around the area. It’s designed to make engines malfunction and bring down the aircraft.’

‘It might be true,’ Rocky said. ‘A lot of planes were lost out there. That’s why we’re not allowed to go there anymore – and why I lied to those shithead Norwegians.’

‘So what do we do?’ Stanford asked.

‘We just stay a high altitude. That means we won’t see too much, but it’s better than nothing. We’ll land near the mountains anyway. We’ll go in on the snow tractor. We just have to see that circle of ice caps to know where we’re going.’

Stanford looked down, saw the dazzling all-white landscape, the peaks of glaciers merging with the snow, revealed only by flashing light. He felt tense and excited, a pulse beating in his stomach, closed his eyes and thought of where he had come from and still couldn’t believe it. He had left the past behind him. He could never return. He had found out too much, was a threat, and now would have to be wiped out. Stanford opened his eyes again. A vast white plain filled his vision. Looking at it, he realized that he had come to the end of the road. There was nowhere else to run to. There was nowhere to hide. If he managed to return from the Antarctic, he would find no safe place. Finally, he was trapped. He was one of the hunted. He was at the lowest point on Earth and could travel no farther. So what about Epstein? What would he do if he found his old friend? Contracts would be out on both of them and the hunters would find them. Stanford sighed and looked down. He saw a boundless white terrain. It was a wilderness of drifting snow and ice, and might yet be his resting place. Stanford didn’t really care. It didn’t matter anymore. He saw the white world sweeping out to meet the sky, and suddenly

felt a great peace.

‘Holy fuck!’ Rocky said.

Stanford followed his pointing finger, saw the radiant blue sky, great circles of white light spreading out to form luminous patterns. He was used to that by now, knew the tricks of the Antarctic, but leaned forward and looked more intently at what Rocky was excitedly indicating. Something flashed and blinked off. The rings of light framed the blue sky. He kept looking and he saw the flash again about nine o’clock high. It came and went in an instant. Before he could blink, it appeared again. This time it was much farther down: a brief flash and then nothing.

‘Over there,’ Rocky said, pointing. ‘It’s changed position… Jesus Christ, *now there’s two of them*!’

Stanford followed his pointing finger. He saw two pulsating lights. They were west of the airplane, flying level with it, pacing it, two dime-sized pulsating white lights in the light-streaked blue sky. Stanford shook his head to clear it. The two lights were now three. The third light had just abruptly winked on, as if it had always been there. Rocky whooped with excitement. The lights were flying in formation. They formed the three points of a triangle and kept abreast of the airplane.

‘It could be nothing,’ Stanford said. ‘It might just be atmospheric phenomena.’

‘No way,’ Rocky said. ‘Those lights are *moving*! Those motherfuckers are pacing us… There they go… *Wow*!’

The three lights broke apart, moving slowly, serenely, one ascending and one descending, leaving the other one between them, forming a long, vertical line. It was a precise, vertical line, pacing the plane, pulsating brightly, the three lights about a hundred feet apart, one on top of the other. Rocky whooped

with excitement. Stanford just stared, entranced. The lights pulsated against the vivid blue sky and outshone the bright sunlight.

Then two suddenly exploded – not exploded: disappeared – were suddenly over and under the airplane as two large, silvery disks. The plane vibrated violently. It was sandwiched between the saucers. The saucers glittered above and below the plane and were approximately a hundred feet wide. Then the plane just cut out. Rocky wrestled with the controls. Glancing down, Stanford saw a curving stretch of metallic-gray; looking up, he saw the base of the other saucer, a black hole right above him. It was a stark, total blackness, denying definition, so deep that it was more like a hole than anything solid. Stanford blinked and it was gone. The silent plane plummeted downward. Stanford saw the glistening snow, the glinting peaks of the glaciers, two lights streaking away to join a third, the whole sky disappearing. The plane kept diving and Rocky cursed, fighting vainly with the controls, then the engine suddenly roared back into life and the plane leveled out. Stanford saw the sky again, swinging down and then steadying; he saw the three lights streaking toward a line of mountains and then blinking out.

‘Holy shit!’ Rocky said.

‘What the hell’s happening here?’ One of the crew had come up from the rear, wiping blood from his nose. ‘We nearly lost the snow tractor. I nearly got my head smashed. What the hell are you doing, diving like that? That area back there was wild.’

‘We had an accident,’ Rocky lied.

‘What the hell does *that* mean? This fucking airplane went as dead as a doornail and damned nearly killed us.’

‘It’s okay,’ Rocky said. ‘I made a little mistake. Stop worrying. It won’t happen again. Don’t get your balls in a knot.’

‘You’re fucking crazy,’ the man said.

‘That’s right, I’m fucking crazy. Now get your fat ass back to the rear and keep your eyes on that tractor.’

The man vanished back inside. Stanford stared straight ahead. Rocky pulled the plane up, climbing gradually, gaining altitude, glancing at Stanford, his eyes large with excitement, beads of sweat on his forehead. Stanford glanced down at the mountains, saw the snow-covered peaks, stark shadows breaking up the white cliffs where great canyons divided them.

‘That’s it,’ Rocky said. ‘And that’s where the saucers went. You were right, holy shit, you were right: they’re hiding somewhere down there.’

‘You better keep climbing,’ Stanford said.

‘That’s just what I’m doing. Though I don’t know if it’ll do any good if those saucers come back. Did you see how fast they moved? And they definitely killed our engine. The plane was dead, but it just kept flying as if by pure magic. I still can’t buy it. I just don’t believe it’s possible. But those saucers killed our engine, they somehow carried us with them, then they just flew away and let us drop – and I don’t understand that.’

Rocky shook his head in wonder, pulled the plane up, kept climbing, leveled out when he felt that they were safe, muttering under his breath. They were approaching the mountains, flying high above the peaks, seeing sunlight flashing on and off the ice to form faint, shifting rainbows. There was more color there: the peaks were tinged with pink and green, the light beating off the ice to make arches of yellow and gold. The mountain peaks were free of snow, thrusting up to the sky, a white haze that faded into violet and then became azure blue. Stanford felt overwhelmed, his eyes glued to the terrain, seeing the shadows of canyons and ravines as black scars on the glaring white.

‘Fuck.’ Rocky said. ‘We’re too high. We won’t see a damned thing.’

They were above the mountains now, turning west and flying along them, looking down on ink-black shadow and flashing light, an indication of ravines and ice peaks, a ribboned scar through pure white. Then the plane started coughing, started spluttering and vibrating, dipped and then picked up again, its engine malfunctioning. Rocky cursed and glanced at Stanford. They both looked down at the mountains. They saw the ribbon of shadow and light splitting in two, the two ribbons rippling outward and then returning to form a dark circle.

‘That’s it!’ Rocky bawled.

‘Yes,’ Stanford said, ‘that’s it. And we must be on the edge of the force field. You’d better go higher.’

‘Jesus Christ, can you see it?’

‘Yes, Rocky, I can see it. Now let’s get the hell out of her and land somewhere safe.’

Rocky shook his head from side to side, started changing direction, circling around and then heading back the way they had come, muttering under his breath. Stanford looked down, saw the circle passing under them, the boundless white terrain all around it, a blank, frozen wilderness. Then he blinked and looked again, saw two lights fanning out, streaking up from the glaciers in opposite directions, flying apart at incredible speed and then just disappearing. Stanford looked down at the mountain, saw nothing and then looked up, saw a light shooting away to the west and then just blinking out.

Stanford couldn’t believe it. Turning his head to look east, he saw a light ascending vertically, stopping abruptly, then racing toward him. He shouted a warning to Rocky. He didn’t know what that light was. It ballooned into a massive, flaring disk that shot past them and disappeared. The plane shrieked

and rocked violently, was bathed in a blinding radiance, the light racing away and shrinking in the west and then shooting up vertically. The plane settled down again. Rocky glanced wildly around him. The same man came out of the rear and said, ‘Hey, what the fuck?’ and then the light from the west raced back again and shot past and was gone. ‘Lord Almighty!’ Rocky said. A light shot out of the east and then flared up and shot by them and disappeared. The man behind them was thrown sideways. The lights exploded over the plane and passed each other and disappeared on both sides. The man behind them was cursing. Equipment shot off the shelves and flew around and formed a shocking cacophony. Rocky fought with the controls. Stanford glanced east and west. The lights were pinpoints in the distance, flying at incredible speed, suddenly ballooning above the plane as massive silvery disks, making the plane rock, then racing away in opposite directions, becoming pinpoints again.

‘Holy shit! We can’t beat them!’

Rocky fought with the controls, trying to keep his plane steady, but was defeated every time the disks shot past and stopped as pinpoints some miles away. The plane was shrieking, rocking wildly, the holding bay now in chaos, the man behind them bawling incoherently as he rolled on the floor. Stanford looked east and west, saw the pinpoints of light, blinked and saw the huge silvery disks expanding overhead, shrinking. The plane rocked even more. It was coughing and spluttering. The disks raced back and forth, from east to west, and kept passing each other.

Stanford observed them, amazed. He hardly thought of the bucking plane. He was fascinated by the speed and capability of the two flying saucers. They raced in and shot away. Stanford tried to see them properly. He put his head back and looked straight above him, but it didn’t help much. The flying saucers were too fast. They passed faster then he could blink. He saw nothing but a flaring silvery mass that divided and disappeared. Then he looked east and west. He saw the pinpoints of light. They ascended vertically, then

descended again and then were spread out above him. The plane rocked when they passed, its engine spluttering on and off, and the two men in the holding bay were bawling as equipment fell on them.

‘We’re going down!’ Rocky bawled.

The horizon rose above the cockpit, the white plains spreading out, sunlight flashing on and off the iced peaks around the edge of the mountains. Rocky tried to pull the plane up, struggling with the control column, cursing as the plane spiraled downward, heading straight for the mountains. The flaring light fanned out above them, seemed to boil through the cockpit, disappeared as the plane shrieked and shook and went out of control. The disks appeared out of nowhere, this time passing over and under before shooting away. Stanford was stunned. The disks had sandwiched the falling plane, had passed so close he thought they would crush it, and again were mere pinpoints in the distance. The plane spluttered and kept falling. The shadowed mountains spun below them. Rocky screamed a stream of vile abuse as the mountains rushed up at them.

First the sky, then the white plains, then the spinning ink-black shadows, then the flashing of glaciers and ice caps and the deep, jagged canyons. The plane kept nose-diving, its engine spluttering, then dying, the mountains spreading out and then spinning and becoming a jigsaw. Rocky screamed his abuse. The men were bawling in the rear. Stanford looked down, mesmerized, seeing light-reflecting ice, the great snowfalls leading into the canyons of brown earth and ocher rock. It spread out and spun around them. Walls of ice shot up on all sides. Dazzling light flared up and swept through the cockpit and then became darkness.

The plane lurched and leveled out, raced along an ice-free canyon. A glowing disk, about a hundred feet wide, was keeping pace just below it. Stanford looked down, blinked a few times, then looked up. There was another enormous disk above the plane, a black, silver-edged whirlpool. The plane wasn’t making a sound. The saucers made a whipping noise. They were so

close to the plane, they almost touched it, and somehow they were drawing it onward.

Then the black hole was gone. The sky exploded above them. The plane roared back to life and climbed steeply toward the snow and then it was out on its own again. It left the canyon far below. There was no sign of the saucers. The plane leveled out and raced across a gleaming ice cap that surmounted a snow-covered mountain ridge. Rocky whooped and grinned wildly and grabbed the control column. Stanford glanced down and saw a round shadow racing over the ice cap. 'Shit, no!' Rocky howled. Stanford jerked his head back. Looking up, he saw a dime-sized, glowing disk, growing bigger, descending.

'*Not again*!' Rocky bawled.

First the sky, then the saucer, a black whirlpool above them, stretching out about fifty feet on either side, a swirling silver-edged glowing mass. The plane's engine cut out. The swirling mass pressed them down. Rocky fought with the control column and then screamed more abuse. Stanford looked up at the saucer. He couldn't define what he was seeing. He was looking up at a swirling dark mass that pulsated and glowed. It defied the laws of science. It was black, yet filled with light. It glowed and was devoid of all color, had no depth, yet seemed hollow. Stanford observed it and was foiled. He didn't know what he was seeing. Then it flared up and changed, became a dull, metallic-gray, possibly spinning, its rim glowing and pulsating, racing in, shooting skyward. Stanford blinked and it was gone. Rocky's scream made him look down. The plane was just above the ice cap, flying across its glassy surface, the ice rushing up and spreading out around them and becoming a blurred white.

'*Hold on*!' Rocky screamed.

The skis screeched touching down, chopped the ice and sent it flying, a white storm that howled and raged in their ears and pummeled the fuselage. The

plane bounced up and down, the skis chopping and screeching, blocks of ice and great chunks of packed snow sweeping past in boiling white clouds. The noise was hellish, almost deafening, reverberating around the cockpit as the skis chopped through the ice and dug deep and finally buried themselves. Stanford saw the spinning sky, his head exploding, stars streaming, heard more screeching and hissing and bawling, felt breathless and bruised. Opening his eyes, he saw Rocky, snow swirling outside the windshield. Rocky jackknifed, slumped over, hanging over his safety belt, then jerked upright and shook his head to clear it as the snow settled down again.

‘Hallelujah! We’ve landed.’

He grinned at Stanford, a wild light in his eyes, then shook his head again, unsnapped his safety belt, slithered out of his chair. Stanford quickly did the same, felt various pains darting through him, twisted out of his chair and followed Rocky back into the holding bay. He saw the eyes of the other men, four wide eyes, glazed with shock, floating hopelessly in the gloom of the holding bay, a scene of chaos behind them. Rocky waved and bawled at them, pushed them, took command, not giving them time to think about it, moving quickly and ruthlessly.

‘Okay!’ he bawled. ‘Get that ramp down! Let’s get the hell out of here!’

The ramp crashed down to the snow, a dazzling brightness poured in, the two men silhouetted in glaring white, the plane filled with an icy chill. Stanford stepped forward slowly, his bones aching, head spinning. He saw Rocky waving frantically, heard him bawling, felt the cold creeping into him.

‘Right!’ Rocky bawled. ‘Fucking great! You’re doing fine! Now let’s get the snow tractor out! Okay! Move your asses!’

The silhouettes became men, heading back toward the snow tractor, light flashing in striations around them as they unsnapped the clamps. There was a sharp ringing sound, the clamps banging on the floor, as Stanford passed the

men and went to the ramp and looked up at the sky. A white sheen streaked with blue, stunning clarity, no clouds; then he saw a steel-gray sphere in the sky, high up, hovering silently. Rocky bawled instructions, his voice reverberating, blending in with clanging metal, then the snow tractor, bright yellow and ungainly, slid down the sloped ramp. Stanford shivered, feeling the cold, as the two men filed past him; he stopped Rocky and pointed at the sky and saw his bearded friend nodding. They went together down the ramp, then climbed up onto the tractor. Stanford saw the other men, their eyes too big, glazed with fear, then the tractor suddenly roared and lurched forward, heading east, going nowhere.

There was nowhere to go. They were on a high plateau. The ice cap was a flat snow-white terrain that stretched around them for miles. The tractor churned the snow up. It swirled around them and soaked them. Stanford saw a white ribbon of land between the sky and the ice cap. That land was thousands of feet below them. There might be no way down. Stanford thought about that and felt only a cold, blinding rage.

'*Jesus Christ*!' Rocky hissed.

First the light, then the gloom, the snow billowing up around them, a humming, a vibrating, a savage jolting sensation, a black hole one hundred feet in diameter hovering quietly above them. One man cursed, another screamed, the tractor sliding to the left, Rocky hissing a stream of vile abuse aimed at the saucer. The saucer remained where it was, offering a faint humming sound, its base a vast black hole revolving above the tractor to create a blinding, pummeling snow-storm.

'*Fucking cunts*! *They'll just bury us*!'

Ricky bawled his defiance, pushing the tractor to its limits, grinding over the ice cap, fighting through the swirling snow, heading into a featureless white haze that offered them nothing. Stanford looked up at the saucer, at that rotating black base; when it moved to the side he finally saw its seamless,

silvery-gray body sweeping up to what he thought, vision obscured, was a solid, metallic dome. The saucer appeared to be motionless, always keeping the same distance, but in fact it was moving, inching forward, pacing the tractor, still whipping up the minor snow-storm. Rocky cursed and tried to lose it, swinging the tractor left and right, but the snow swirled and hissed and devoured them, totally blinding them.

Rocky kept going across the ice cap, heading nowhere in particular, just desperately hoping to escape from the hovering saucer and the snow it was whipping up. They were moving through an eternity, time frozen, all frozen: the tractor and the men and the landscape and the saucer above them. Stanford saw the other two men, one cracking and screaming and shaking and frantically waving his hands. He tried to leap off the tractor, was pulled back by his friend, both falling down and rolling on the floor. Stanford shivered and looked up, numbed by cold, choked with rage, and saw the black base of the saucer as it suddenly glided toward them and then came down upon them.

Then its laser beams shot down, turning the snow into steam, two beams of pulsating light that split the ice right in front of them. The ice cracked in jagged lines, spewing steam and spinning diamonds, hissing and snapping and exploding with an earthquake's fierce venom. Rocky cursed and spun around, was flung forward, hands outstretched, as the tractor crashed down into a crevice and the laser beams vanished. Rocky spinning – Stanford saw it, his own body jackknifing, rolling over and exploding with pain, his feet finding the floor again. The tractor growled and churned the snow up, tilted downward, going nowhere, a much stronger, more devastating storm howling wildly about them. Stanford stood up, felt lost, heard a wretched, shocked sobbing, saw the dark mass of the saucer just above, now obscured by the swirling snow. The sobbing turned into a scream, a pair of hands waving frantically, the man pushing his friend to the floor, then falling over the side. Stanford saw him, did nothing, thought of nothing, felt dreamlike, was pushed forward by a pair of strong hands and urged over the side. He dropped into the snow, was whipped by it, numbed totally, saw the dark mass in the

sky, the three shadowy forms just ahead, stumbling blindly and bawling.

First the wind, then the snow, then the dark mass, then the whiteout, then the running, crouched low, seeing nothing, then the beam of pulsating light. The beam swept across their path, and they ran, leaping forward, heard a scream and turned around and saw a man sinking down, disappearing. The ice snapped and the chasm widened, falling a thousand feet, and they turned away and plunged into the storm, the great saucer above them. Stanford heard another scream, couldn't tell one man from the other, saw a rigid beam of light beaming down upon a dancing silhouette. The man quivered and spun around, his face briefly illuminated, then he jerked and fell back, his eyes bright in the light, and the snapping ice split and opened wide and then swallowed him whole.

Stanford turned back and ran, turned right and saw the other unknown man as a shadowy form. They fled together, as one, moving blindly, not thinking, pushed onward by the dark mass above them, each leaning on the other. Then more beams of light shot down, the lasers cutting through the ice, the ice snapping and hissing and streaming and exploding around them. They both stopped, feeling trapped, both alone with a shadow, then they moved again, running around the beams of light, the snow flaying their skin. Too late: they saw the end. A beam of light shot between them. Stanford jumped back and stumbled and fell and heard the other man screaming. Then darkness, the snapping sound of ice splitting, the dying echo of the man plunging down a thousand feet to his death. Then silence. And nothing.

Stanford lay there on his back, the snow settling around him, his skin numb, his bones aching, head spinning, the brilliant daylight returning. He observed the saucer descending, no longer glowing, enormous and very real in the sunlight, descending gently and quietly. Stanford sat up, fell back, pressed his hands into the snow, gasped and turned onto his belly, saw the radiant blue sky. He was near the edge of the ice cap, a thousand feet above the lowlands, his eyes drinking in a stunning panorama of white, frozen wilderness. It was

too much, too blinding, too remote to be real, and he sighed and rolled onto his back and then forced himself upright. The saucer was there before him, its seamless sides sweeping up to a large steel dome, resting lightly on the snow of the ice cap, the sun flashing around it.

Stanford studied the saucer. He felt cold, but very calm. He sat there on the ice, in the snow and the silence, a white wilderness one thousand feet below, a radiant blue sky above. Stanford sat there and waited.

CHAPTER THIRTY-FIVE

Stanford waited a long time, his eyes fixed on the gleaming saucer, the snow drifting lazily around him, the silence unbroken. The saucer seemed enormous, its sloping sides a seamless gray, sweeping up to a solid metal dome. The dome was thirty-five feet high, the saucer three times that in width, sunlight beating down and flashing off its gray surface and turning it white. All white. Everything. The land and sky looked the same. There was no definition, no sense of direction; just a glaring, white void all around him, that stark, total silence.

The saucer didn't move, made no sound, offered nothing, was simply spread out across the ice cap as if actually part of it. Stanford sat there and studied it, feeling cold but very calm, occasionally squinting into the white haze on all sides, a light frost gradually covering him. The saucer still didn't move. It made no sound at all. After a long time, feeling the cold eating at him, Stanford climbed to his feet.

His bones were bruised and aching, his skin numb, his head light, and he stood there for a moment, uncertain, the snow drifting about him. Then he walked toward the saucer, feeling small, slightly unreal, stopped a few feet away from its near edge and saw it towering over him. He stared at it with wonder. The steel surface swept up to the dome, exceptionally smooth, totally seamless, curving back down and then under its edge, becoming part of the base. There were no doors or windows, no visible lights. He looked up at the solid metal dome, but it was vague in the white haze. Stanford stood there, bemused. The saucer filled his line of vision. He stepped forward, stopped close to the curved edge, then reached out and touched it.

The metal felt like sandpaper. Stanford ran his fingers across it. He felt air, or he thought he felt air, and then he stepped closer to it. The metal was porous, the holes smaller than grains of sand, scraping almost imperceptibly against his fingertips and releasing trapped air. Stanford smiled and looked closer, examining the curved edge; he saw fine, nearly invisible lines crisscrossing each other. The lines formed various rectangles, some small, others large, sweeping up to the base of the metal dome, dissected by other lines. Stanford studied them at length. He heard a low-pitched humming sound. Panels slid upward around the sloping edge to reveal hidden lights.

Stanford stood there, not moving. The lights were covered with convex glass or Perspex, various colors, thick and opaque, with a very slight ripple finish. None of the lights were on. The low-pitched humming sound grew louder. A series of panels slid upward where the sloping surface was almost vertical, revealing a long, rectangular window that curved around the whole body of the saucer. The windows were illuminated with violet light, then this color changed to a whitish yellow. A group of shadowy, human-shaped figures were lined up along the window, obviously staring down at him.

Stanford stood there, waiting patiently. He heard a muffled hissing sound. A large section of the curved wall moved forward, tilting back from its top edge. It slid out on large steel hinges, tilting backward, moving forward, its front edge eventually touching the ground, its back edge still inside the saucer. The section of wall was now a ramp, leading up into the saucer. Stanford studied the wide, rectangular opening and saw a white wall beyond it. The men at the windows were looking at him. The windows were well above the door. Stanford smiled and then walked up the ramp and found himself in a corridor.

The inner wall was white and blank. There were windows on the other wall. These windows were behind the gray shell of the saucer’s body, or fuselage. The corridor curved away from him and obviously ran around the saucer. He then heard a sharp hissing sound and the door closed behind him.

He stood there in the corridor. He waited, but no one came. There was a muffled humming all around him, above him, below him. Intrigued, he started walking. He felt no fear at all. The humming sound was filling his head and it helped him relax. The corridor curved around the saucer, its white walls and ceiling arched, then a door slid across the space directly in front of him, forcing him to stop walking.

There was a room to his left, white walls forming a perfect circle, broken up by the rectangular windows at which the men had been standing. A small hunchbacked man approached him, waving an unusually delicate hand, inviting him in. Stanford stepped into the circular room and stopped close to the hunchback.

‘You’re all right?’ the hunchback asked.

‘I think so,’ Stanford said.

‘I’m Ruediger,’ the hunchback said. ‘Please don’t worry. We will take you down now.’

Stanford gazed around the room. It was shaped like a large dome. The walls were covered with control panels and consoles and what looked like computers. There were eight men in the room. They were uncommonly small. Some were young boys, others were Ache Indians, three were fair-skinned and middle-aged. About half of them wore masks that were made of thin metal, covering their noses and mouths, molded close to the skin. Stanford studied them, fascinated and horrified, realising that they were cyborgs: part men, part machine. The boys and Indians were at the consoles, seated in chairs fixed to the floor, the control panels flickering. The other men studied Stanford, not smiling, their eyes dead, then they turned away and sat in other chairs, turning knobs, pressing buttons, flicking switches. The computers started flashing. The muffled humming sound grew louder. Stanford felt a light vibration, *thought* he felt it, wasn’t sure, then he looked down at the small man with the hunched back, saw his upturned brown eyes.

‘Come,’ the hunchback said. He was smiling and indicating with his hands. The hands had an unusual delicacy, a feminine grace. ‘Come,’ he said. ‘I will show you.’

He led Stanford across the floor, up some steps to a raised platform, the floor running right around the dome, above the computers and consoles. The long windows were there. Stanford stood beside the hunchback. The ice cap was shrinking beneath him, blending in with the mountains, the glittering snowfalls of the wilderness spreading out until they encompassed the horizon. The saucer was ascending, climbing vertically, leisurely, then it stopped, or seemed to stop – Stanford didn’t feel a thing – then it moved horizontally, as if flying backward, and then descended again.

There was no sense of motion. The saucer descended at the speed of an elevator, falling into the mountains. The mountain peaks climbed up around them, first the rock, then blocks of snow, then the sheer, towering walls of blue ice, turning green, disappearing.

They were moving faster now. The saucer was flying horizontally. Walls of algae and plankton, moss-covered rocks splashed with white, were sweeping past on both sides of the saucer as it raced through a canyon. There was still no sense of motion. Stanford thought he could feel a light vibration. Looking down, he saw the rim of the saucer, metallic-gray in a pulsating, glowing haze. Then he looked ahead again, saw the canyon walls parting, opening out around a lake, the lake whipping out of sight, more snow, more brown earth, a rich green spreading outward, then an immense, round valley, its white cliffs soaring skyward, the ice flashing and fading away above the earth and then becoming pure rock. The saucer flew across the valley, the green earth rushing at them, then the rushing earth slowed down, almost stopped, then rose gently to greet them.

Stanford didn’t feel a thing. There was no sense of movement. The saucer drifted, or appeared to drift, across the wide valley, heading toward the towering cliffs that surrounded it and cast gigantic shadows. The hunchback

raised a hand and pointed. Stanford stared straight ahead. He saw the mouths of large natural caves at the base of the ice-free cliffs.

‘We go in there,’ the hunchback said.

Stanford glanced at the rim of the saucer, saw the pulsating glow dying, the panels around the rim opening to expose all the lights. Then the lights started flashing, left to right, right to left, a kaleidoscope of green and blue and orange and violet, flashing right around the rim of the saucer as it moved slowly forward. The caves expanded as they approached, became enormous dark tunnels, and the saucer glided into a tunnel, its colored lights flashing on and off. Stanford saw natural rock, the glint of moisture and green moss, then saw a pinpoint of light far ahead, growing bigger each second. First a pinpoint, then a dime, then a glowing balloon, then a round exit racing at them and pouring light over them.

Stanford saw another valley, almost roofed in with cliffs, the rocks forming an umbrella above, the sun beaming through crevices. The valley floor was far below, broken up by silvery domes, some minute, others looking quite large, the ground around them a deep brown. The saucer hovered and then descended, dropping slowly, almost leisurely; it appeared to bob up and down gently, yet Stanford felt nothing. He looked down on the silvery domes, at first mistaking them for geodesic domes, but then saw them rising up and becoming larger and taking shape as parked saucers. Stanford stared at them, bemused. The valley was spread out around him. The saucer dropped past a soaring wall of glinting metal, and Stanford, looking back, saw a flying saucer as big as a cathedral: one of the legendary carrying ships.

The saucer touched down gently. The hunchback looked up and smiled. Stanford gazed through the window, saw a large square steel platform, the flashing lights around the saucer’s rim blinking out one by one. The metal panels slid back down, leaving the saucer’s body, the fuselage, looking smooth and seamless once more. The steel platform was above the ground, thrusting out from the face of the cliff, fronting a tunnel from which a group

of men emerged, bareheaded, wearing coveralls. They were all big men, their lower half of their faces in silvery masks, and they pushed a mobile lounge against the saucer as its door angled downward. The door was swallowed by the mobile lounge. The lounge was pushed against the saucer. Its angled edge had been perfectly contoured to the saucer's sloped surface.

'We go out now,' the hunchback said.

Accompanied by a cyborg guard, he led Stanford down the steps, across the dome-shaped white room, past the adolescents in coveralls, the Ache in the chairs, their mouths and noses sealed and rendered useless, their narrow eyes dulled and fathomless. Stanford, now accepting them, almost thinking of them as normal, left the room with the hunchback, followed him back along the curving white-walled corridor with its row of sealed windows. They turned onto the ramp, the lounge's ceiling arched over them, the walls and floor painted white, the windows framing solid rock, passed through the lounge and continued along a tunnel with invisible lighting. The tunnel was quite long and had been hacked out of the rock; it ran into the bowels of the mountain and was surprisingly warm.

As Stanford followed the hunchback, he studied his strange hands, took note of their uncommon, almost feminine delicacy, the crude contrast of powerful arms. Then they left the tunnel, stepping into brilliant light, crossed a catwalk high above a workshop of impressive dimensions. Stanford saw jibs and cranes, a lot of roaring machines, sheets of metal, dull-gray and all shapes, being swung to and fro. There were hundreds of workers down there, steel benches, steaming vats, blast furnaces and screeching electric drills, immense saucer-shaped skeletons.

Stanford stopped to see more, but was pushed forward by a cyborg, saw an oblong metal plate in his fist, was touched by it and received a shock from it. It was a sharp electric shock, jolting painfully through his shoulder, and he hurried onward, still following the hunchback, his arm stinging and burning. They passed through another tunnel, crossed a steel-plated room, rows of

frosted-glass cabinets on the shelves, naked bodies inside them. Stanford stared at them, startled, felt the chill in the room, then recovered and followed the hunchback through a door that led into another room.

This room was a laboratory, steel-plated, quite large, the walls rising to a ceiling of chiseled rock that was part of the mountain. The staff looked perfectly normal, men and women in white smocks, reading and writing, peering into microscopes, checking printouts and gauges and thermometers, working quietly, intently. What was different were the specimens in the cages and glass jars: human heads, pumping hearts, floating brains and intestines, a naked body sitting upright in a chair, a wire frame where its head should have been. The frame was shaped like a human head, was made from crisscrossing wires, contained flashing bulbs and fuses and copper coils, wires and tubes running out of it. The wires and tubes ran to a console, were plugged into various sockets, the console flashing and buzzing, activating the headless body, its arms rising and falling, legs kicking: a puppet of flesh and blood. Stanford quickly turned away, saw the hunchback smiling at him, felt the sting of the electric fist in his back, so followed the hunchback through another door.

They passed through a kind of warehouse, its walls hacked out of the mountain, refrigerated and couched in semidarkness, filled with tables and cabinets. Stanford tried not to look, was fascinated and horrified, his head level with the cabinets, the tables on all sides, his eyes drawn against their will to what was present: the nightmare of scientific progress.

The cabinets kept the flesh frozen, arms and legs, hands and feet, wires extending from bloody necks and stumps, electrodes sprouting from sliced skulls. The tables were even worse, the human subjects not completed: here a steel chin and nose, there a woman with plastic breasts, here a torso with metal legs, valves and tubes instead of genitals, there a chest with the skin peeled off the bone, its hydraulic heart pumping. Other cabinets contained the hardware: the exoskeletons and pacemakers, the percutaneous power

connections, the bifurcated blood vessels and aortic valves and silicone boosters, the orthopedic braces and cobalt joints and piezoelectric generators – the stainless steel and chromium, the meat and bone, of those picked to be cyborgs.

‘Jesus Christ,’ Stanford whispered.

The metal fist thumped his spine, the electric shock stabbing through him, and he gasped and followed the hunchback past the tables, the cyborg padding behind him. They went through another doorway, passed more bodies in cabinets, the glass frosted, the graph needles not moving, and then came to yet another door. The hunchback stepped aside, bowed to Stanford, waved at him, and Stanford stepped through the doorway and was dazzled by bright light and plate glass.

He was in a dome-shaped room, its white metal walls gleaming, large windows running around the curved wall, framing clear sky and mountain peaks. There were doors between the windows, steel-plated, all closed, large consoles jutting out just above them, their lights flashing on and off. The room was about fifty feet wide. There was a desk in the middle. On the desk there was an intercom, a Micro-film viewer, a pile of books, pens and pencils, notepaper, a black panel of switches. There were chairs in front of the desk, all white, deep and comfortable; there was no other furniture in the room and the floor was cold plastic. A man sat behind the desk. He was staring steadily at Stanford. He was handsome and white-haired and slim, and he waved Stanford forward.

Stanford crossed the cold floor, his footsteps reverberating. It seemed to take a long time to reach the desk, but he got there eventually. He stopped and stared at Wilson. He had no doubt that it was Wilson. Stanford saw the unusually seamless forehead and knew who he was talking to.

‘Mr Wilson,’ he said.

‘Yes,’ Wilson replied. ‘You’ve come a long way to see me.’

Stanford didn’t smile. He hadn’t smiled in a long time. He rubbed his beard and looked at Wilson’s blue eyes and was reminded of the Antarctic ice.

‘This is it,’ Wilson said. He waved his hand in a careless manner. ‘Those doors lead out to the colony, to all the different departments; the consoles tell me what’s going on and I control it from here. The colony forms a sort of circle. The tunnels run right through the mountain. The tunnels are the spokes of the wheel, and this room is the hub. We’re at the top of a plateau. The tunnels lead down to the bottom. The saucers and construction plants are down there, and can’t be seen from the sky. This room constitutes the highest point. Overhanging rocks hide it. I have lived here for more than thirty years and I find it inspiring.’

Wilson offered a bleak smile, his blue eyes as cold as ice, brightened with a luminous intelligence that did not show emotion. There was no malice in him. Stanford sensed that immediately. Wilson knew neither malice nor fear: he had gone beyond all that.

‘You know who I am?’ Stanford asked.

‘Naturally,’ Wilson said. ‘We’ve been watching you and Epstein for years; you were both too persistent.’

‘Where is he?’ Stanford asked.

‘You’ll see him soon,’ Wilson said. ‘Dr Epstein is healthier than he was – and is really quite happy.’

‘Happy?’

‘Yes, happy,’ Wilson said.

‘What the fuck did you do to him?’ Stanford said.

‘I just offered him life.’

Wilson smiled and stood up, crossed the room to the window, his movements excessively slow and careful, then stopped and looked out. All white. Everything. The Antarctic was spread out far below. He turned away from the window and looked at Stanford, his face smooth and expressionless.

‘Why did you come here?’ he asked.

‘I came for Epstein,’ Stanford said.

‘No,’ Wilson said, ‘I don’t think so. That doesn’t make sense.’

‘Why not?’ Stanford asked.

‘You must have known you couldn’t go back. You knew you couldn’t get in here unless we let you enter – and you knew that you couldn’t escape. You must have known that and yet you still came… It wasn’t just for your old friend.’

‘Partly that,’ Stanford said.

‘And the other part?’ Wilson asked.

‘I don’t know,’ Stanford said. ‘I’m not sure. I guess I just had to finish it.’

Wilson smiled without humor. The smile didn’t reach his eyes. He went around the desk and sat down, his gaze still fixed on Stanford.

‘You’re living dangerously,’ Stanford said.

‘I’m not sure I understand.’

‘We’re all alone here,’ Stanford said. ‘I could kill you. And I think I might do it.’

‘I don’t think so,’ Wilson said. ‘You didn’t come here for that. Besides, it would serve little purpose: it would not affect this place.’

‘You’re not concerned for yourself?’

‘Not really,’ Wilson said. ‘I’ve had a long life, a full life, but it can’t last forever.’

‘You’re a cyborg,’ Stanford said.

‘Not quite accurate,’ Wilson said. ‘I have an artificial heart, a few joints are prosthetic replacements, my face has undergone plastic surgery, but I’m hardly a cyborg. Not that it makes much difference. Even cyborgs pass away. We still haven’t conquered the liver, and that means we’re still mortal.’

‘How long have you got left?’

‘A few more years,’ Wilson said.

‘Then what? What happens when you die?’

‘This place will continue.’

He stared steadily at Stanford. His eyes radiated no feelings. He displayed neither malice nor warmth, his soul destroyed by intelligence.

‘Man is simply a tool,’ he said. ‘He is the seed of evolution. He exists to explore and create, and has no other value. But men alone are self-destructive. Without discipline they rot. Take the history of man and examine it and you come up with lunacy. Wasted time and opportunity, self-indulgence and corruption, material greed and self-pity and vanity – all negative impulses. The will to freedom has never worked; every success has been matched with failure; we step forward and then we step back and wallow in pettiness. Our superiority is in thinking. Only the mind has any value. But our animal needs, our appetites and fears, keep us chained in self-

imposed imprisonment. We must leave the cave behind us. We must reach for the stars. We can't do that while Democracy persists and lets freedom destroy us.'

'Freedom leads to creativity.'

'No, it doesn't,' Wilson said. 'Freedom leads to boredom and conflict and waste – and encourages stagnancy.'

'The world hasn't stagnated.'

'It hasn't advanced much,' Wilson said. 'Or, at least, it's only advanced on one level and is now dangerously imbalanced. We have advanced scientifically, have made extraordinary leaps forward, and now we stand on the brink of the miraculous and can reshape man's future. But that advance was intellectual. We're still emotionally retarded. The other side of man is still as primitive as it was in the cave. That side remains unchanged. It hides the dire results of freedom. It disguises mindless greed, political suspicion and social fear, pointless hatred and the boredom and resentment that lead to destruction. The world is wallowing in bloodshed, the atmosphere's being polluted, we're gradually gobbling up our natural resources and inviting a barren Earth. We do this because of greed, because of politics and war, and these things are the consequences of so-called freedom, the fruits of Democracy. Man must have a purpose. He must be disciplined and driven. Only then will the world become sane and save itself from ruination.'

'Totalitarianism,' Stanford said. 'A world of masters and slaves. The people will be content because they're zombies… and the Earth will be peaceful.'

'You disapprove,' Wilson said.

'Damned right, I disapprove. It's obscene and it's been tried before and it just never works. A man needs free choice. Without that, he's not a man. To steal a man's will and contradictions it to steal his humanity.'

‘That’s sentiment,’ Wilson said.

‘I’m a sentimentalist,’ Stanford said.

‘You’re a primitive,’ Wilson said. ‘You’re self-destructive. That’s why you came here.’

‘Fuck you,’ Stanford said. ‘What you’re saying is shit. And you won’t get away with it forever – the world out there won’t let you.’

‘Won’t it?’ Wilson said. ‘How naive you are, Stanford. The world out there is part of the conspiracy – and has been for years. The United States knows about us. The Soviet Union knows about us. The British and the Germans know about us, and all of them deal with us. What I have is what they need. What I’m doing is what they want. The world is out of control, freedom has led to revolution, and now Democracy is no more than a name to keep the innocent happy. You think your people are any different? No, Stanford, they’re not. Totalitarianism creeps over the world and is stifling resistance. Regimentation is increasing. People are numbers instead of names. The world is now ruled by a selected few, and suppression is spreading. Surveillance is widespread. Every citizen is on file. The salient facts of every individual human have been fed to computers. Television mesmerizes them. Piped music fills their factories. Credit cards and employment cards and passports have rendered privacy obsolete. All these people are mere numbers. Their so-called freedom is an illusion. Their politics, their culture, their religions have no bearing on anything. Let them demonstrate occasionally. Let them criticize and abuse. Feed them issues that will keep them engaged while the real work goes on. In the end, they’ll be passive. They won’t really have any choice. Their credit cards and employment cards and passports can be withdrawn at any time. Such items make or break them. A select few decide the issue. The mass of men are led by the nose and they don’t even know it. That’s your freedom, Mr Stanford. That’s your precious Democracy. The world is a chess game, the pieces are property, and the game is only played by the select few who hide behind closed doors.’

‘A neat theory,’ Stanford said. ‘But it has one glaring flaw. Your players will fight amongst themselves, and you’ll still have world conflict. The Americans want you out of here. The Russians want you out as well. They’re human beings and they’re filled with the suspicion and fear that you loathe. You won’t have peace on Earth. They’re just playing for time. When they’re ready, or when they *think* that they’re ready, they’ll come at you with everything. You just said it yourself: they’re not logical creatures. They’re human beings and they’re moved by primitive fears – and that’s the flaw in your scheme. Sooner or later, they’ll try it. It might be madness, but they’ll try it. Then the war that will come, caused by you, will be the war to end wars.’

‘You’re wrong,’ Wilson said quietly. ‘I’ve made allowances for that. I’m not so naive as to imagine that this race can continue. The race will *not* continue. It will end in ten years time. Within ten years every major government post will be run from this colony. We have people everywhere, in every country, in every government, and those people have electrodes in their heads and will do what we tell them. They are currently in the Pentagon, in the CIA and FBI, in NASA and the Cheyenne Mountain Complex, in the Army and Navy and Air Force, in every top-secret project. It’s the same all over the world. We have our people everywhere. We’re robotizing important people every year, and every year it gets easier. They don’t know they’re robotized. They believe they’re making their own decisions. But every new law of suppression, every new surveillance system, every action that changes the course of world events is dictated by us. We grow more numerous every month. We’re gradually climbing up the pyramid. In ten years – or possibly less – all the rules will be our rules. Your world is ending, Stanford. It will soon be no more. If I sent you back out there tomorrow, it would do you no good.’

Stanford didn’t know what to say. There was nothing left to say. He hadn’t experienced emotion for months, but now he felt it returning. That emotion was fear. It might well have been despair. He gazed down at the man behind

the desk and saw the ice of his blue eyes. Those eyes were devoid of feeling. No malice, no resentment, no greed… It was organization.

Stanford thought this and was shocked. He thought of the world beyond the mountains. That world, his own world, was procreating and becoming too complex. The cities couldn't be controlled, the great suburbs were a mess; inequality and boredom and frustration were leading to madness. Increasing violence and civil strife, increasing wealth and attendant poverty; the contradictions of society were exploding and destroying whole nations. The politicians were defeated: freedom foiled them every day; more and more they were introducing legislation that encouraged suppression. They didn't appear to have much choice. Increasing chaos overwhelmed them. Categorization and surveillance and harassment were all they had left. Stanford thought of it with woe. He desperately wanted an alternative. He felt human for the first time in months and he was paying the full price. The fear chilled him and shook him, turned into bitter rage. He looked at Wilson and felt the first stirrings of a cold, hard defiance.

'Where's Epstein?' he asked.

Wilson reached across the desk, flicked a switch and then stood up. He led Stanford across the room to a door, not saying a word. Stanford looked above the door. A red light flashed on a console. He turned his head and looked out through the window at the Antarctic wilderness. The panorama was stupendous: the white plains stretched to the sky; the jagged mountain peaks were just below, their rocks ringed with blue ice. Then the steel door slid open. Wilson waved Stanford in. They stood together in the white-walled elevator and the doors closed in front of them.

The elevator descended quietly, dropping down through the mountain. Stanford thought of what the German had told him about Hitler's teahouse. He saw a window in one wall. Floors slid upward and disappeared. There was hardly any sound, no sense of motion, and the elevator was comfortably warm. Wilson didn't say a word. He studied Stanford with detachment.

Stanford saw a huge cavern, littered grottoes and caves, various workshops and storerooms and offices, people working in silence. The elevator door slid open. They stepped out into an office. The walls were painted white, the shelves were packed with books, and Professor Epstein was sitting behind a desk, looking up, smiling distantly.

‘Hello, Stanford,’ he said.

Stanford studied his old friend. Epstein did indeed look healthy. He had put on some weight, his gray beard had been trimmed, and he was wearing a shirt and tie, a white coat, his cheeks ruddy, his eyes clear.

‘I’ll leave you now,’ Wilson said. ‘I hope you come to an agreement. You’ll have to make a decision, Dr Stanford, and I hope it’s the right one.’

He turned back to the steel door, the door opened and he stepped in, then the door closed and Wilson was gone, leaving silence behind him.

Stanford studied his old friend. Epstein stayed behind his desk. His hands were clasped under his bearded chin, his eyes clear and steady.

‘It’s good to see you,’ he said.

‘Is it?’ Stanford asked.

‘It’s been a long time,’ Epstein said. ‘It seems more than a year.’

‘What happened to the cancer?’

‘They cured me,’ Epstein said. ‘They’re really quite extraordinary that way. I must say I was grateful.’

‘Grateful?’ Stanford asked.

‘A new life,’ Epstein said. ‘Not just that, but new purpose, new work… Something worth living for.’

Stanford looked at his old friend and a felt a searing anguish, a despair that came out of his very bowels and made him feel lost.

‘What did they do to you?’ he asked.

‘They did nothing,’ Epstein said. ‘They cured me of cancer and explained what they were doing, and I realized that their work was important and decided to stay.’

‘They did an implant,’ Stanford said.

‘Not on me,’ Epstein said.

‘Either you’re lying or you simply can’t remember. They must have done *something*.’

‘They did nothing,’ Epstein said.

‘Jesus Christ,’ Stanford said.

‘Believe me, they didn’t do a thing. They just talked and I listened.’

‘And this is what you want?’

‘Yes, it’s what I want. They took me up above the Earth and showed me things that I just can’t forget.’

‘They did an implant.’

‘Not in me.’

‘They do it to everybody,’ Stanford said. ‘They must have done it to you.’

‘They didn’t.’

‘You don’t remember.’

‘I don’t remember because they didn’t do it. I just want peace and quiet now.’

‘I’m taking you out of here,’ Stanford said.

‘I won’t go,’ Epstein said. ‘The very thought of it gives me a migraine. I just don’t want to go.’

‘A migraine?’ Stanford asked.

‘The thought of outside,’ Epstein said.

‘They did an implant.’

‘No, they didn’t,’ Epstein said. ‘I just don’t want to go.’

Stanford felt hot and clammy, swept with anguish and despair, a hopelessness that threatened to drown him and choke off his resistance. He thought of Jacobs and Gerhardt, of the girl near Galveston, of Scaduto and Epstein and himself and all the years now behind them. The mystery was resolved. The nightmare was manifest. The world was being saved from itself and taking on a new face. Stanford wanted no part of it. He didn’t want to lose himself. He wanted to live with his contradictions and conflicts and the pain of free choice. Yet the price was too great. He didn’t know if he could pay it. He looked down at his old friend, Professor Epstein, and the pain slithered through him. Professor Epstein was no more. His placid eyes were all-revealing. His gazed at Stanford without malice or friendship, offering nothing and everything. Stanford shook with grief and rage. He let his senses fly away. The pain took him apart and just as quickly put him back together and gave life to defiance.

‘You must stay here,’ Epstein said. ‘We need people like you. You will work and know great satisfaction and never feel discontentment.’

‘I don’t want it,’ Stanford said.

‘You must accept it,’ Epstein said.

‘You’re not Epstein,’ Stanford said. ‘You’re someone else. You’re not the person I knew.’

‘I’m the same,’ Epstein said. ‘They just cured me of the cancer. Now I do the kind of work I always dreamed of – and feel wonderful with it.’

‘They’ve stolen your mind.’

‘That’s ridiculous,’ Epstein said. ‘I know you. I remember my past. I know just who I am.’

‘They’ve stolen your will.’

‘They’ve stolen nothing,’ Epstein said. ‘They just talked and I listened and that’s all. They did not operate.’

‘You can’t remember,’ Stanford said.

‘I’m getting a headache,’ Epstein said. ‘We really must stop talking about this. You must stay. You can’t leave here.’

Epstein’s gaze was placid. His hands were folded on the desk. He looked at Stanford with a calm, remote interest, talking quietly and patiently.

‘You can’t leave here,’ he repeated. ‘There’s really no place to go. You can walk out whenever you wish, but you’ll freeze to death out there. Here you’ll live a painless life. Your life will take on some meaning. You might be deprived of your imagined freedom, but think of the blessings. No more discontentment. No decisions to be made. You will work and take pleasure in that work and never know doubt or fear.’

‘I’ll be robotized.’

‘They won’t do that.’

‘They did it to you,’ Stanford said.

‘No, they didn’t. They didn’t.’

Stanford knew it was useless. His feeling of loss was overwhelming. He let the grief and rage shake him loose and make him fight for his freedom. It didn’t matter where he went. He didn’t give a damn what happened. The point now was to make a decision and then follow through on it.

‘You said I can leave.’

‘That’s correct,’ Epstein said. ‘We won’t stop you, but we won’t help you either. The decision is yours.’

‘I want to leave.’

‘You’ll freeze to death,’ Epstein said.

‘Fuck you,’ Stanford said. ‘Fuck you all. I won’t submit to this shit.’

Epstein sighed and stood up. He walked to the nearest wall. There were large curtains drawn across the wall, reaching down to the floor. Epstein tugged on a sash cord. The wide curtains drew apart. A dazzling light poured through a plate-glass door and washed over both of them. Stanford blinked and rubbed his eyes. He was looking along a hall of glass. Through the glass walls he could see the glaring white of the immense, frozen wilderness.

‘The choice is yours,’ Epstein said. ‘You can stay or you can leave. However, once the decision is made there can be no turning back. You just have to touch this door. It will open and let you through. Once you step into the hall the door will close and trap you in there. You can only leave by the other door. It’s at the far end of the hall. That door opens by contact from inside,

and leads out to the wilderness. You can't open it from outside. If you step out, you have to stay out. You can leave or you can stay – as you wish – and you must decide now.'

Stanford looked at his old friend, at his gray, remote eyes, mutely prayed for some sign of emotion, but received calm indifference. The feeling of loss was overwhelming, the pain unprecedented, shaking Stanford and making his heart pound, leaving nothing but rage.

He would hold the rage and use it. He would make his decision. Neither old friends nor memories nor hopes would make him bend to their will. He was not a machine. He would not be a cipher. Stanford looked along the hall, saw the dazzling sunlight, saw the white haze running out to the sky and then pressed on the plate glass. The wide doors slid apart. The glass hall was filled with light. Stanford stared at his old friend, at his gray eyes and beard, thought of all that they had been through together and dissolved into anguish.

'You're not Epstein,' he said.

He stepped into the hall. The plate-glass doors closed behind him. Sunlight blazed through the glass walls and roof to form dazzling mosaics. Stanford zipped his jacket up. He covered his ears with his woollen hat. He put his hands in his pockets and stepped forward, determined not to look back. The past was now behind him. The hall stretched out to the future. Stanford saw a globe of fire fill the sky with lines of silver and pink. He walked quickly along the hall. The flashing glass was all around him. He reached the door at the far end of the hall and stopped a few feet away from it. Stanford wanted to say something, wanted to speak to the silence, but he stepped forward and the glass doors slid open and the fierce cold rushed in.

All white. Everything. The cold was appalling. Stanford leaned into the wind and stepped forward as the doors closed behind him. He didn't stop or look back. The white wilderness lay before him. The wind blew the snow in languid, glinting clouds across the pack ice and glaciers. Stanford kept

moving forward. He didn’t care where he was going. He saw an arch of light above a horizon that forever receded. All light. Flashing light. A unique and dazzling vision. The light flashed and made his eyes sting and weep. Stanford didn’t give a damn. He felt defiant and proud. He was alive and he kept moving forward to disprove all their theories. He saw a monstrous balloon. It was floating there before him. The balloon was transparent and it shimmered and framed a pink sky. Stanford shivered and stumbled. He had to clench his chattering teeth. The wind moaned and made the snow swirl around him and settle upon him. He ignored it, kept going. His teeth began to ache. The snow settled on his beard and his face and then formed a light frost.

All white. Everything. Definition was lost. The wind moaned and the snow blew all around him and made him a part of it. He fell down and stood up and stumbled forward again. He thought of Epstein and Wilson and the colony and the great flying saucers. The future was here and now. His own time had passed. The snow formed immense darkened portals that were luring him in. He stepped in and saw a light, stumbled forward and watched it grow. The snow hissed and swirled and then the shimmering bright light exploded. All white. Everything. He let the wilderness embrace him. Glinting glaciers and flashing pack ice and streams of yellow and violet. The frost thickened on his face. He couldn’t feel his numbed lips. The hands deep in his pockets had vanished and left shrieking nerve ends. Stanford laughed as he froze. The icy air filled his lungs. He stumbled onward, heading into the wilderness, and would not be defeated.

He went out a long way. The mountains fell far behind him. The white wilderness stretched out on all sides and offered no exit. Stanford didn’t give a damn. He thought of what he had left behind. The future that would rise from the ice held no promise for him. Stanford’s lips cracked when he smiled. His blood froze on the instant. He moved onward with his weeping eyes stinging, his hands and feet missing. No feeling. All numb. The ground shifting and sliding. A great rainbow appeared above the horizon and framed a fierce whiteness. Then a luminous balloon. A mirage: a sun dog. He saw

miracles of blue ice and light, the dazzling wastes of the snowfalls. Stanford stumbled on, regardless. He started talking and singing. He heard a voice that was offering comfort and coaxing him onward. He followed the Pied Piper. He let the sun and snow dissolve him. He fell down and saw the huge slabs of pack ice that drifted and glittered.

He would travel, he would move. He crept along on his belly. His frozen fingers found the snow and dug in and his body inched forward. Stanford saw the drifting ice. He sang and muttered under his breath. Jagged black lines on white glare. A giant jigsaw in the sun. Stanford felt a fierce defiance and exultation that would not let him die. He crawled across the frozen earth. He dragged a dead thing behind him, his body, and would not let it go. Stanford slithered across a crevice. His fingers touched a slab of ice. The ice glittered and reflected the sun as the swirling snow settled down. Stanford muttered and sang. He heard someone singing somewhere. His fingers touched and felt nothing and bent as his body inched forward. Stanford saw streams of light. The light flashed and beat about him. Stanford slithered onto the slab of pack ice and rolled onto his back.

All white. Everything. Stanford saw lights in the sky. They were very high up, very small, pulsating and glowing. He knew what the lights were. He smiled when he saw them. The lights were like stars in the white sky, very bright and intense. Stanford lay there on the pack ice. The ice drifted imperceptibly. Stanford lay there and let the frost encase him and grow into more ice. The lights glided across the sky. They defied the sky's bright haze. The ice drifted and flashed blue and yellow and became part of Stanford. He lay there and smiled. The ice carried him away. He felt a fierce defiance and exultation that would not let him die. The frost thickened and hardened. It molded Stanford to the pack ice. He turned around in the sun, a glass figure, quite beautiful, the light flashing on and off him, exploding, streaming skyward, gradually turning him into a glacier, a prism… a star.

AUTHOR'S NOTE

While *Genesis* is a work of fiction, it has been based on certain facts which the author feels are worth bringing to light.

In the course of researching a different novel altogether, I obtained, through the Imperial War Museum in London, two short articles that immediately attracted my attention. The first was a routine war report by Marshall Yarrow, then the Reuters special correspondent to Supreme Headquarters in liberated Paris. This article had been published, among other places, in the *South Wales Argus* on December 13, 1944, and it stated: 'The Germans have produced a "secret weapon" in keeping with the Christmas season. The new device, which is apparently an air defence weapon, resembles the glass balls which adorn Christmas trees. They have been seen hanging in the air over German territory, sometimes singly, sometimes in clusters. They are colored silver and are apparently transparent.' The second article, an Associated Press release, extracted from the New York *Herald Tribune* of January 2, 1945, illuminated the subject even more. It said: 'Now, it seems, the Nazis have thrown something new into the night skies over Germany. It is the weird, mysterious "Foo Fighter" balls which race alongside the wings of Beaufighters flying intruder missions over Germany. Pilots have been encountering this eerie weapon for more than a month in their night flights. No-one apparently knows what this sky weapon is. The balls of fire appear suddenly and accompany the planes for miles. They seem to be radio-controlled from the ground, so official intelligence reports reveal…'

Intrigued by these reports, I conducted some more research and discovered a highly technical but little known book entitled *Intercettateli Senza Sparare*

(see ‘Sources’ for details) by Renato Vesco, in which the author claims that the ‘Foo Fighter’ actually existed, that it was originally called the *Feuerball*, and that it was first constructed at the aeronautical establishment at Wiener Neustadt, with the help of the Flugfunk Forschungsanstalt of Oberpfaffenhoffen (F.F.O.) According to Vesco, the *Feuerball* was a flat, circular flying machine, powered by a special turbojet engine, that was used by the Germans during the closing stages of the war both as an anti-radar device and as a ‘psychological’ weapon against Allied pilots. Says Vesco: ‘The fiery halo around its perimeter – caused by a very rich fuel mixture – and the chemical additives that interrupted the flow of electricity by overionizing the atmosphere in the vicinity of the plane, generally around the wing tips or tail surfaces, subjected the H2S radar on the plane to the action of powerful electrostatic fields and electromagnetic impulses.’ Vesco also claims that the basic principles of the *Feuerball* were later applied to a much larger ‘symmetrical circular aircraft’, the *Kugelblitz* (or Ball Lightning Fighter), which was the first example of the vertical-rising, ‘jet lift’ aircraft.

Further intrigued, I continued my research in West Germany and came up with a surprising number of newspaper and magazine clippings – all from the 1950s – about one *Flugkapitän* Rudolph Schriever. One clipping stated that this *Luftwaffe* engineer had designed, in the spring of 1941, the prototype for a ‘flying top’ and that the device was tested in June, 1942; another stated that the same *Flugkapitän* Schriever, with ‘three trusted colleagues’, had actually constructed, in August 1943, a ‘large specimen’ of his original ‘flying disk’, but that in the summer of 1944, in the East Hall of the B. M. W. plant near Prague, he had redesigned the original model, replacing its former gas turbine engines with some highly advanced form of jet propulsion; and a third, which reiterated the above information, added the interesting news that original plans for the flying disk had been drawn up by the ‘German experts’, Habermohl and Miethe, and an Italian physicist, Dr Belluzzo. According to other reports (and, subsequently, to Major Rudolph Luzar’s indispensable book, *German Secret Weapons of World War II*, English language editions published by Neville Spearman, London, 1959, and the Philosophical

Library, New York, 1959), Habermohl and Schriever had designed a large ring plate with ‘adjustable wing-disks’ that rotated around a ‘fixed, cupola-shaped cockpit’, while Miethe had developed a ‘discus-shaped plate in which adjustable jets were inserted’. Reportedly, the flying saucer had a diameter of 42 m. ((137.76 ft.), a height from base to canopy of 32 m. (104.96 ft.) and had reached an altitude of approximately 40,000 ft. with a horizontal flight speed of 2,000 km./h. (1,250 mph).

So far, so good… But what I now came to was a series of small but puzzling contradictions.

Shortly after the war, Rudolph Schriever was resident at Hokerstrasse 28 in Bremerhaven-Lehe, West Germany, from where he announced that the flying disk had indeed been constructed, that it had been ready for testing in April 1945, but that with the advance of the Allies into Germany, the test flight had been cancelled, the machine entirely destroyed, and his design papers either mislaid or stolen. Schriever’s story was, however, slightly contradicted by alleged eye-witness Georg Klein, who later stated that he had actually *seen* the test flight of the Schriever disk, or one similar, on February 14, 1945. A certain doubt may be cast on Klein’s date since, according to the War Diary of the 8th Air Fleet, February 14, 1945, was a day of low clouds, rain, snow and generally poor visibility – hardly the conditions for the testing of a revolutionary new kind of aircraft. Nevertheless, according to Renato Vesco, the test flight of a machine called the *Kugelblitz* – which was rumoured to be a revolutionary kind of supersonic aircraft – was successfully conducted over the underground complex of Kahla, in Thuringia, *some* time during that February of 1945.

By 1975 *Luftfahrt International* was stating that a certain *Flugkapitän* Rudolph Schriever had died in the late 1950s and that found among his papers were the incomplete notes for a large flying saucer (most of them technically out of date), a series of rough sketches of the machine (some of which had clearly been redrawn and updated just before his death), and

several newspaper clippings about himself and his supposed flying saucer. Now, while none of the designs would have led to a workable flying saucer, *Luftfahrt International* did include reproductions of the designs of both Schriever and Dr Miethe, while also pointing out that Schriever, right up to his death, had been convinced that the UFO sightings since the end of the war were proof that his original ideas had been taken further with successful results.

Could this be true?

Let us examine the possibilities. According to Schriever, what appears to have been the final version of his flying saucer was constructed at the B. M. W plant near Prague in the early months of 1944 and was ready for testing in April 1944. According to Georg Klein, a similar flying disk was actually test-flown near Prague in February 1945; and according to the Italian author, Renato Vesco – who seems unaware of the existence of the Schriever legend – an extraordinary new flying machine called the *Kugelblitz* was test-flown sometime during that same month over the complex of Kahla, in the mountain region of Thuringia.

Tying in with this information is the fact that the gas-turbine section of B. M. W. was originally located in the suburb of Spandau, near Belin – where, according to Renato Vesco, a lot of research on the *Kugelblitz* was undertaken; that it was later moved to the underground plant at Wittringen, near Saarbrucken; but that it finally ended up, as from 1944, in seven enormous underground complexes in both Thuringia and Nordhausen in the Harz Mountains.

That whole area, running in a metaphorical arc from the Harz Mountains, down through Thuringia, Bohmen and Mahren, was to form the German's last redoubt and as such was littered with a staggering number of underground military and scientific complexes, including the immense Mittle-Werke factories and the personnel and equipment from the experimental center at Peenemünde. Certainly, while history was to decree

otherwise, it was from there that Hitler intended to defend the remnants of the Third Reich with ‘a whole underground army’ and the ‘secret weapons’ he had been promised for so long.

In May, 1978, at Stand 111 in a scientific exhibition in the Hanover Messe Hall, some gentlemen were giving away what at first sight appeared to be an orthodox scientific tabloid newspaper called *Brisant*. This contained two seemingly unrelated articles: one on the scientific future of Antarctica, the other about Nazi Germany’s World War II flying saucers. The flying saucer article reiterated the information mentioned above, but added that the research centers for ‘*Projekt Saucer*’ had been located in the areas of Bohmen and Mahren.

Regarding this, it should be noted that Prague is in Bohmen, and that Bohmen is more or less surrounded by the metaphorical arc of the Harz Mountains, Thuringia and Mahren – all of which areas contained vast underground research complexes, none of which were more than a few hundred kilometers from Prague.

The article also included reproductions of detailed drawings of a typical Second World War flying disk, did *not* mention the designer’s name, and claimed that the drawings had been altered by the West German government to render them ‘safe’ for publication. Adding weight to this claim, the unnamed author then pointed out that during the Second World War all such inventions, whether civilian or military, would have been submitted to the nearest patent office where, under paragraphs 30a and 99 of the *Patent-und Strafgesetsbuch*, they would have automatically been stamped ‘Secret’, taken away from their rightful owners, and passed on to Heinrich Himmler’s SS research establishments… and, according to the article, at the end of the war some of those patents disappeared into secret Russian files, others into equally secret British and American files, and the remainder would possibly have disappeared with various ‘missing’ German scientists and SS troops.

(Since neither the British, the Americans or the Russians are ever likely to

reveal what, precisely, was discovered in the secret factories of Nazi Germany, it is worth noting that in 1945 Sir Roy Feddon, as leader of a technical mission to Germany for the Ministry of Aircraft Production, reported: 'I have seen enough of their designs and production plans to realize that if they had managed to prolong the war some months longer, we would have been confronted with a set of entirely new and deadly developments in air warfare.' And by 1956, Captain Edward J. Ruppelt, then head of the U.S. Air Force's Project Blue Book, was able to state: 'When World War II ended, the Germans had several radical types of aircraft and guided missiles under development. The majority of these were in the most preliminary stages, but they were the only known craft that could even approach the performances of the objects reported by UFO observers.')

The *Brisant* article went on to point out that in 1938, Hitler, anxious for a foothold in the Antarctic, sent an expedition commanded by Captain Alfred Richter to the coast due south of South Africa. Daily for three weeks two seaplanes were catapulted from the deck of the German aircraft-carrier *Schwabenland*, with orders to fly back and forth across the territory that Norwegian explorers had named Queen Maud Land. The Germans made a far more thorough study of the area than the Norwegians had done, finding vast regions that were surprisingly free of ice. This job done, they renamed the whole area *Neuschwabenland* and claimed it as part of the Third Reich.

According to *Brisant*, German ships and U-boats continued to prowl the South Atlantic Ocean, particularly between South Africa and the Antarctic, throughout the whole of the Second World War. Then, in March, 1945, just before the end of the war, two German provision U-boats, U-530 and U-977, were launched from a port on the Baltic Sea. Reportedly they took with them members of the flying saucer research teams, the last of the most vital flying saucer components, the notes and drawings for the saucer, and the designs for immense underground complexes and living accommodations based on the remarkable underground factories of Nordhausen in the Harz Mountains. The two U-boats duly reached Neuschwabenland, more correctly known as Queen

Maud Land, where they unloaded. Finally, two months *after* the war, the same U-boats surfaced mysteriously off the coast of Argentina where the crews were handed over to the American authorities, who interrogated them at length and then flew them all back to the United States.

About a year after this, the United States launched the biggest operation ever known regarding the Antarctic. While the stated purpose of the operation was to 'circumnavigate the 16,000-mile Antarctic coastline and map it thoroughly', *Brisant* found it odd that Operation Highjump, under the command of Antarctic veteran Admiral Richard Evelyn Byrd, included thirteen ships, two seaplane tenders, an aircraft-carrier, six twin-engine R4D transports, six Martin PBM flying boats, six helicopters and a staggering total of 4,000 men. It was also considered odd that when this virtual assault force reached the Antarctic coast, it not only docked, on January 27, 1947, near the German-claimed territory of Neuschwabenland, but then divided up into three separate task forces.

That expedition became something of a mystery. Subsequent official reports stated that it had been an enormous success, revealing more about the Antarctic than had ever been known before. However, many other, mainly foreign, reports suggested that such in fact had not been the case: that many of Byrd's men were lost during the first day, that at least four of his airplanes inexplicably disappeared, and that while the expedition had gone provisioned for six to eight months, the men actually returned to America in February 1947, after only a few weeks. According to *Brisant*, Admiral Byrd later told a reporter (I could find no verification for this) that it was 'necessary for the USA to take defensive actions against enemy air fighters which come from the polar regions' and that in the case of a new war the USA would be 'attacked by fighters that are able to fly from one pole to the other with incredible speed'. Also, according to *Brisant*, shortly after his return from the Antarctic, Admiral Byrd was ordered to undergo a secret cross-examination – and the United States withdrew from the Antarctic for almost a decade.

What was being suggested, then, is that throughout the course of the Second World War the Germans were sending ships and planes to the Antarctic with equipment for massive underground complexes, that at the end of the war the flying saucer project's team of scientists were taken by submarines U-530 and U-977, that the Americans interrogated the crews of those submarines when they docked in what they had assumed was a friendly Argentina, that the Americans then, upon hearing about the Antarctic base, organized a military task force disguised as an exploratory expedition, that the expedition was subsequently put to disarray when it came up against the extraordinary German flying saucers, and that the United States then pulled out of the Antarctic temporarily, in order to build their own saucers based on the designs found in Germany after the war.

The second article was also of interest. It was, in point of fact, a rather crude propaganda statement masquerading as a scientific review of Antarctic potential. Dusting off the already well known topographical facts, what one was left with was an insistence that the Democratic Republic of Germany should claim back their rights to that part of the Antarctic which the Nazis stole from the Norwegians and arrogantly renamed *Neuschwabenland*.

Taking note of the National Socialist leanings of the article, bearing in mind the fact that *Brisant* had been published by a company that had since disappeared (*Lintec*, GmbH, Jungfrauenthal 22, D-200 Hamburg 13), and reminding myself that the whole theory had suspicious parallels with the more far-fetched 'Holes in the Poles' UFO myths, I nevertheless checked up on other aspects of the article and discovered that the Germans had in fact been patrolling the Antarctic regions of the South Atlantic Ocean throughout the war. Indeed, two years after the Richter expedition, a couple of Norwegian whaling ships were seized by boarding parties from the German raider *Pinguin* as they rested at anchor in their own territorial waters just off Queen Maud Land. Within hours of that incident, a Norwegian supply ship and most of the nearby whaling convoy had been lured into the trap – and the war in Antarctica was underway. In May 1941 HMS *Cornwall* located and

sank the *Pinguin*, but not before *Pinguin* had captured a whole string of Allied merchant ships totalling more than 135,000 tons. What is also historical fact is that *Pinguin's* sister ships, appropriately named *Komet* and *Atlantis*, continued to prowl the Antarctic shores until the end of the war.

Regarding the two submarines, I also came across some intriguing information. U-977, under the command of Captain Heinz Schaeffer, did in fact leave Kiel harbour in the Baltic Sea in April, 1945, stopped in at Christiansund South on April 26, left there the following day, and was not seen again until it surfaced at Mar del Plata, Argentina, on August 17, 1945 – a period of nearly four months.

Where was the submarine all that time? According to Captain Schaeffer, they had left with the intention of patrolling the South Atlantic, had docked for fuel at Christiansund South the following day, and had then, several days later, heard over their radio that the war was over. Convinced that he would not be treated too kindly by the Allied Command, Schaeffer gave his crew the option of being put off along the coast of Norway or travelling on with him to what he thought was a friendly Argentina. Since some of the crew preferred to return to Germany, the next few days were spent in hugging the Norwegian coastline until, on May 10, they dropped some of their men off on the mountainous coast not far from Bergen. This done, according to Schaeffer, he and the remaining crew embarked upon what surely must have been one of the most remarkable naval feats of the war: a journey through the North Sea and the English Channel, past Gibraltar and along the coast of Africa, finally surfacing, all of sixty-six days later, in the middle of the South Atlantic Ocean. During the next month they alternated between floating on the surface and diving back to the depths, once even surfacing off the Cape Verde Islands and going ashore on Branca Island, another time going so far as to 'disguise' the submarine when it was on the surface by rigging up false sails and funnel to make it look more like a cargo steamer. Finally, when close to Rio de Janeiro, they heard over their radio that another fleeing German submarine, U-530, had put into the River Plate and that its crew had

been handed over to the United States as prisoners of war. Disturbed by this news, they nevertheless put into Mar del Plata on August 17, 1945 – nearly four months after they had put out from Kiel harbour.

This rather fantastic story was recounted by Captain Schaeffer to the Argentine authorities when they interrogated him on three specific issues: (1) Where had U-977 been when the Brazilian steamer *Babia* was sunk? (2) Why had U-977 arrived in Argentina so long after the war ended? And (3) Had U-977 carried anyone 'of political importance' during its voyage to the Argentine? Schaeffer denied that he had been anywhere in the area of the *Babia* when it was sunk, explained his late arrival in Argentina with the fantastic story I have just recounted, and stated that no one 'of political importance' had ever been aboard U-977.

What is particularly intriguing about all this is that a few weeks later an Anglo-American committee, composed of high-ranking officers especially flown to the Argentine to investigate 'the mysterious case' of U-977, spent a great deal of time interrogating Schaeffer regarding the possibility that he might have taken Hitler and Martin Bormann aboard his U-boat, first to Patagonia and then to a secret Nazi base in the Antarctic. Indeed, they were so insistent on this that they subsequently flew Schaeffer and his crew – *and* Otto Wehrmut, commander of U-530 – back to a prisoner of war camp near Washington, DC, where for months they continued their interrogations. While I could find no record of the fate of Commander Wehrmut, what I did authenticate is that Schaeffer repeatedly denied having shipped anyone where… Nevertheless, he was then handed over to the British in Antwerp and *again* interrogated for many months.

Assuming that Schaeffer was telling the truth and that the Allies found nothing unusual in Schaeffer's U-boat, it seems rather strange that the Americans would later send the submarine back to the United States where, under direct orders from the U.S. War Department, it was blown to pieces with torpedoes. As for Schaeffer, he was eventually returned to Germany, did

not feel comfortable as one of the conquered, and then went back to join some fellow Germans in Argentina.

The possibility remains that Schaeffer might have been lying. For a start, it is decidedly odd that two insignificant German U-boats should have stirred such monumental interest amongst the Allies. It is also worth considering why the Allies would even have imagined that Hitler and Martin Bormann – or anyone else, for that matter – would have fled to such an unlikely place as the Antarctic. Finally, it is worth noting that Schaeffer had spent much of his career protecting the research centers at Regen and Peenemünde, that he was highly experienced at patrolling the South Atlantic and polar regions, and that he was one of a select group of Naval officers who were sent to the Harz Mountains to study the new, reportedly highly advanced, XX1 electric submarines. Schaeffer was, in other words, a man familiar with the 'secret' projects of the Harz Mountains – and a man ideally suited to make the long voyage to the Antarctic.

Now let us review the situation. It is not confirmed, but is very possible, that the German *Feuerball* existed, that it accounted for the first modern UFO sightings during the Second World War, and that an extraordinary supersonic flying machine, the *Kugelblitz*, was successfully test-flown in Germany a few weeks before the war ended. The *Feuerball*, therefore, could have been the forerunner of the small, seemingly remote-controlled UFOs (the Foo Fighters), while the *Kugelblitz* could indeed have been the first of the larger, piloted flying saucers.

The unsigned flying saucer designs reproduced in *Brisant*, and in many more orthodox journals, mentioned materials not in existence, as far as we know, during the war years. This suggests that they could have been reproductions of the original designs that *Flugkapitän* Rudolph Schriever updated just before his death in the late 1950s. Assuming, then, that Schriever's 'mislaid' or 'stolen' notes and designs were actually in the hands of the SS, it is possible that they were secretly developed in one of the many underground

complexes in the area of the aborted last redoubt – either the Nordhausen complex in the Harz Mountains or at Kahla in nearby Thuringia; that the completed saucer was test-flown in the early months of 1945; and that it was then destroyed as the Allies advanced into Germany.

We know from reproductions of the work of Schriever, Bulluzzo and Miethe that a flying saucer project, no matter how primitive at the time, was definitely on the list of German military priorities. Regarding the fact that the only evidence for such machines is the evidence presented above, it should be borne in mind that the most fanatical of Himmler's SS were controlling the research centers in the areas mentioned, that as they retreated they attempted to destroy as much as possible of their most important scientific papers and inventions, and that thousands of slave workers and their SS overlords – who could have revealed a great deal more – disappeared in the chaos of the liberation and were not seen again.

Could some of them have gone to the Antarctic?

Contrary to the accepted view, it is actually quite possible that the Nazis continually shipped and flew vital men, material and documents to the Antarctic throughout the war years.

Regarding the possibility of the submarines of that time being able to complete such a lengthy voyage, it is to be noted that the normal U-boat could cover 7,000 miles on each operational cruise, that the Germans had submarine tankers spread across the South Atlantic Ocean at least as far as south of South Africa, and that any one of those tankers, which had a displacement of 2,000 tons, could have supplied ten U-boats with fuel and stores, thus trebling the time that those U-boats could stay at sea.

Regarding the possibility of the Germans building self-sufficient underground research factories in the Antarctic, it has only to be pointed out that the underground research centers of Nazi Germany were gigantic feats of construction, containing wind-tunnels, machine-shops, assembly plants,

launching pads, supply dumps and accommodations for all who worked there, including adjoining camps for the slave workers – and yet very few people knew that they existed.

Given all this, it is in my estimation quite possible that men and materials were shipped to the Antarctic throughout the war, that throughout those same years the Germans were engaged in the construction of enormous underground complexes in Neuschwabenland similar to those scattered around the last redoubt, and that the American, Russian and British 'cover-up' regarding UFO sightings could be due to the reasons suggested in this novel.

Sceptics would argue that the major histories of the Third Reich either ignore or pass off as ridiculous any stories about Nazi Germany's 'secret' weapons, but such an argument can be countered by reminding the reader that most of the secret weapon projects were well hidden by the SS and that much of what the Allies discovered remains classified to this day.

While Albert Speer, the Third Reich's Minister of Armaments and War Production, was sceptical about the 'secret weapons' in his eloquent book *Inside the Third Reich* (Weidenfeld & Nicolson, London, 1970), he *did* admit that there was increasing speculation about such weapons during the closing months of the war; and that while he himself stated at the time that there were not enough basic materials for the production of such, he had, in his own words, 'underestimated… the large stocks of material that had been accumulated in the factories'. Speer was also sceptical when Robert Ley, the Minister for Labor, excitedly told him, in April, 1945, that his German scientists had invented a 'death ray' (possibly a laser weapon); this is interesting when one considers the fact that Captain Heinz Schaeffer, captain of the submarine U-977, stated in his book, *U-Boat 977* (William Kimber, London, 1952) that in April 1945 an SS associate had offered *him* a demonstration of a so-called 'death ray'. It is unfortunate that Schaeffer, in a hurry to return to Kiel for his famous last voyage, had no time to remain in

Berlin and check out the validity of his friend's claim.

For the purposes of fiction I have utilized the real-life personages, SS Generals Hans Kammler and Artur Nebe. Readers might therefore be interested in knowing that while Nebe was placed on a Nazi 'death list' after the attempted assassination of Hitler, his death was never actually confirmed and many felt that he had simply fled for his life. As for General Hans Kammler, his history with the SS and the V-1 and V-2 rockets is well documented, but what became of him after he disappeared from Germany in April 1945 remains a mystery to this day.

Regarding the members of the German flying saucer team, Schriever and Belluzzo are now dead, Habermohl was reported to have been captured by the Russians (thus the American military's fear of *Russian* saucers shortly after the war), and – perhaps most interesting – Miethe, who stated to the press that he had worked on *Projekt Saucer*, went to work for the Americans and Canadians.

Finally, for the record, the prototype for the AVRO flying saucer, which was handed over to the U.S. and loudly proclaimed to have been a failure, is now (at the time of writing) on show in the U.S. Air Force Museum in Fort Eustis, Virginia.

Thus, while *Genesis* is a work of fiction, it is based on some intriguing facts… and those facts could do with further investigation.

A list of sources is given overleaf.

SOURCES

The earliest article about the German 'foo fighter' was published in the *South Wales Argus* of December 13, 1944. An Associated Press release by Marshall Yarrow (Reuters special correspondent at Supreme Headquarters, Paris, France) was published in the New York *Herald Tribune* of January 2, 1945. Another article was published in the London *Daily Telegraph*, also on January 2, 1945.

Information about *Flugkapitän* Rudolph Schriever and his fellow officers on Nazi Germany's *Projekt Saucer* came mainly from the following magazine articles: 'Untertassen – Flieger Kombination', *Der Spiegel*, March 30, 1950. 'Fliegende Untertasse in Deutschland erfunden', *Sonderbericht der Deutschen Illustrierte*, S.1350, 1951. 'Fliegende Untertassen – eine Deutsche Erfindung', *Die sieben Tage*, No. 26, June 27, 1952. 'Die Deutsche Fliegende Untertasse', *Das Ufer – die Farb-Illustrierte*, No. 18, September 1, 1952. 'Erste Flugscheibe flog 1945 in Prag', *Welt am Sonntag*, April 25, 1953. 'Wunderwaffen 45', *Bild am Sonntag*, February 17, 1957. 'Die UFOs – eine Deutsche Erfindung', *Das neue Zeitalter*, October 5, 1957. 'Flugkreisel, irdisch', *Heim und Welt*, No. 14, April 2, 1959. 'Deutsche UFOs schon 1947/48 einwandfrei beobachtet', *Das neue Zeitalter*, February 6, 1965. 'Deutsche Flugkreisel', *Luftfahrt International*, No. 9, May-June, 1975. 'Mit UFOs zu neuer Gravitationstheorie', *Kurier*, November 20, 1976. 'Fliegende Teller statt Hubschrauber', *Hobby*, December 14, 1977. 'Fliegende Scheiben und Viktor Schauberger', *Kosmische Evolution*, No. 4, 1979. 'Prototypen der Kreisflügler AS 6 V 1', *Luftfahrt International*, No. 4/ 1979.

Books on rocket and aircraft development include: *Soviet Rocketry* (David & Charles, Newton Abbot, 1971) by Michael Stoiko. *The Papers of Robert H. Goddard* (McGraw-Hill, New York, 1970), edited by E.C. Goddard. *The Birth of the Missile: The Secrets of Peenemünde* (Harrap, London, 1965) by E. Klee and O. Merk. *German Guided Missiles* (Ian Allan, London, 1966) by R. F. Pocock. *V2* (Hurst and Blackett, London, 1954) by Walter Dornberger. *Hitler's Last Weapons: The Underground War Against the V1 and V2* (Julian Friedmann, London, 1978) by Jozef Garlinksi. *Raketon-Flugtechnik* (Edwards Press, Ann Arbor, Michigan 1945; reprint of 1933 edition, published by Oldenbourg of München) by E. Sanger. *Alsos* (Schuman, New York, 1947) by Samuel A. Goudsmit.

The indispensable book on the development of disk-shaped aircraft is *Intercettateli Senza Sparare* (E. Mursia & Co., Milan, Italy, 1968) by Renato Vesco. This was later published in an English translation by Grove Press, New York (1971) under the title *Intercept - But Don't Shoot*, then reissued in 1974 by Zebra Publications, New York, as *Intercept UFO*. Unfortunately it has been out of print for years. A short but decent article on *Projekt Saucer* and related projects is to be found in *German Secret Weapons of World War II* (Neville Spearman, London, 1959; the Philosophical Library, New York, 1959) by Major Rudolph Lusar. Most of Lusar's article is reproduced with other German flying-saucer material and considerable wishful thinking in *UFOs: Nazi Secret Weapons?* (Samisdat, Toronto, Canada, undated) by Mattern Friedrich, aka Ernst Zundl.

The most comprehensive studies of the UFO phenomenon as a whole are *The UFO Controversy in America* (Signet, New American Library, New York 1975) by David Michael Jacobs; and *UFO Exist!* (Ballantine, New York, 1976) by Paris Flammonde. Both of these books include detailed accounts of the Great Airship Scare of 1896-97. *The Report on Unidentified Flying Objects* (Doubleday, New York, 1956) by former Project Blue Book head, Captain Edward J. Ruppelt, is the classic book of its period; and its natural companion is *Project Blue Book* (Ballantine, New York, 1976), edited by

Brad Steiger. For purely scientific, or pragmatic, examinations of the phenomenon, one can do no better than Dr J. Allen Hynek's authoritative works, *The UFO Experience: A Scientific Inquiry* (Abelard-Schuman, New York, 1972; Corgi, London, 1974) and *The Hynek UFO Report* (Dell, New York, 1977; Sphere, London, 1978).

Other UFO books relevant to this subject are: *UFOs: A Scientific Debate* (Norton Library, New York, 1974), edited by Carl Sagan and Thornton Page. *The Crack in the Universe* (Neville Spearman, Jersey, 1975) by Jean-Claude Bourret. *UFOs From Behind the Iron Curtain* (Souvenir Press, London, 1974) by Ion Hobana and Julien Weverbergh. *The Interrupted Journey* (Berkley Medallion, New York, 1974) by John G. Fuller. *Beyond Earth: Man's Contact with UFOs* (Corgi, London, 1974) by Ralph Blum with Judy Blum. *The Humanoids* (Neville Spearman, London, 1969; Futura, London, 1974/77), which is a compilation of articles from *Flying Saucer Review*, edited by Charles Bowen. *Celestial Passengers: UFOs & Space Travel* (Penguin, London, 1977) by Margaret Sachs and Ernest Jahn. *Socorro Saucer* (Fontana, London, 1976) by Ray Stanford.

The famous monthly magazine *Flying Saucer Review* is mandatory reading for anyone interested in the subject, but should be perused with a highly selective eye.

I am indebted to NASA’s *Exploring Space With a Camera* and to their reproductions and analysis of the much abused ESSA 7 satellite photographs. I am also heavily indebted to Eliot Porter’s *Antarctica* (Hutchinson, London, 1979) in which both text and photographs are magnificent.

The indispensable book on UFO technology is *UFOlogy* (Celestial Arts, California, 1976) by physicist James M. McCampbell. Articles on the subject, and related articles, are to be found in the excellent *Worlds Beyond* (An/Or Press, the New Dimensions Foundation, Berkeley, California, 1978), edited by Larry Geis and Fabrice Florin, with Peter Beren and Aidan Kelly. Information on CAMS, cyborgs, other man-machine interactions, and general

bio-engineering and various nightmarish experiments was found in: *As Man Becomes Machine* (Abacus, London, by David Rorvik. *Man Modified* (Paladin, London, 1969) by David Fishlock. *The People Shapers* (Futura, London, 1978) by Vance Packard. *Manipulation* (Fontana, London, 1975) by Erwin Lausch. *The Immortalist* (Panther, London, 1973) by Alan Harrington. *PSI: Physic Discoveries Behind the Iron Curtain* (Abacus, 1977) by Sheila Ostrander & Lynn Schroeder. *Future Science* (Anchor Books, Doubleday, New York, 1977), edited by John White and Stanley Krippner. *Robots: Fact, Fiction and Prediction* (Thames and Hudson, London, 1978) by Jasia Reichardt.

U-Boat 977 (William Kimber, London, 1952) by Heinz Schaeffer includes that submarine commander's personal account of his final voyage to Argentina. *The Hollow Earth* (Citadel Press, New Jersey, 1969), by Dr Raymond Bernard is the standard, but hardly credible, book on this bizarre theory. Another book, *This Hollow Earth* (Sphere, London, 1972) by Warren Smith, is even less credible. *Secret Nazi Polar Expeditions* (Samisdat, Toronto, undated) by Christof Friedrich, alias Ernst Zundl, is a neo-Nazi view of this subject which, combined with the aforementioned *UFOs: Nazi Secret Weapons*, by the same author writing under a different pseudonym, is almost certainly responsible for the articles published in the neo-Nazi magazine, *Brisant*, in May 1978.

My thanks to the following libraries and universities for their kind assistance in gathering further research material: Cornell University, New York; the Massachusetts Institute of Technology (MIT), Massachusetts; the University of London; the British Museum Library, London; the Imperial War Museum, London; the Württembergische Landesbibliothek, Freiburg im Breisgau; and the Staats-und Universitätsbibliothek, Hamburg.

Personal thanks to Stephanie Trudeau in New York; Willi Mayer, Reinhold Stoll, and Ruediger and Hannelore Vogt of West Germany; Mark Williams of *Lookout* magazine, Spain; Martin Atcherley for his kind assistance regarding

Paraguay and Argentina; James Webb for his authoritative response to my enquiries about the SS and the Occult; Richard and Iris Gollner, my agents and incidental researchers; Nick Austin for his generosity with certain books; and Alan Earney, for so enthusiastically backing this whole project.

PROJEKT UFO

The Case for Man-Made Flying Saucers

W. A. Harbinson

W.A.Harbinson's groundbreaking non-fiction work, *Projekt Saucer: The Case for Man-Made Flying Saucers*, details the extraordinary facts behind his bestselling novel, *Genesis.* Widely regarded as one of the most detailed and level-headed books ever published on this controversial subject. *Projekt UFO* is also considered by many to offer the definitive explanation for a mystery that has haunted the Western world for over sixty years. Now this revelatory book about 'the world's most fearsome secret', first published in 1995, is again available to a worldwide readership.

This new edition has been updated by the author.

'A fascinating account of the history of UFOs, but from the perspective of their being man-made, not extraterrestrial craft... Forget ETs and invasions from space; the terrestrial scenarios Harbinson speculates are already frightening enough!'

-*Nexus*

'For sheer content and quantity, this book must score ten out of ten. It covers a multitude of topics including biblical encounters, airship scares, spinning disks, World War II sightings, UFO landings, UFOnauts, and much more. A

very worthwhile addition to your stack of bedtime reading.’

‘I have never seen what I would personally consider to be a flying saucer. I’ve spoken to thousands of people who have. I spent fourteen years in industry as a nuclear physicist, chasing neutrons and gamma rays, radiation shielding. I have never seen a neutron or a gamma ray; I think they’re real too. I’ve never even seen Australia, but it’s there’

Foreword

Chapter 1

Biblical and Other Historical UFO Sightings

Unidentified flying objects in ancient records - Aerial phenomena interpreted in the Bible as religious apparitions or visions - The planet Venus; mock suns and moon dogs; meteors; lenticular and noctilucent clouds; temperature inversions; plasmoids, corona discharges and ball lightning - Ancient astronaut proponents - The fantasy world of Erich von Däniken - The Book of Ezekiel - Ancient reports and paintings explained in the light of modern atmospheric and astrological knowledge.

-

Chapter 2

The Great Airship Scare of 1896-7

First recorded use of the word 'saucer' in relation to UFOs- The wave of mystery airship sightings of 1897 - Newspaper speculation, misidentifications, hysterical imaginings and hoaxes - First contact with airship passengers - Photographs - Reported crashes - Final sighting - European development of similar airships - United States patents and drawings - Technology of the period in support of advanced airship designs - The Massachussetts Institute of Technology (MIT) and Sibley College, Cornell University, Ithica, New York - The greatest period in the history of Aviation - The mysterious Mr. Wilson - The airship of Edward Joel Pennington.

Chapter 3

Technology and Sightings of World War II

The 'foo' fighters of World War II - UFOs over Western Europe and Scandinavia - Great aviation achievements - The Russian and American rocket geniuses, Tsiolokovski and Goddard - The German Amateur Rocket Society - Rocket development at Kummersdorf - Captain Walter Dornberger, Werner von Braun, and the German Rocket Research Institute - Rocket development at Peenemünde - The boundary layer: a new branch of aerodynamics - Vertical-rising aircraft - The first jet-propulsion aircraft – The 'all wing' aircraft of Germany's Walter and Riemer Horten - Suction airfoils, porous metals, and the concept of circular, remote-controlled aircraft - German secret weapons and military technology - the disk-shaped Feuerball.

Chapter 4

Division of the Scientific Spoils of War

Division of captured German technology - The launching of United States and Soviet V-2 rockets - The first post-war UFO flap commences in 1946 - Harold Dahl and Maury Island - The Kenneth Arnold sightings - A plague of UFO sightings over United States military bases - Intelligence gathering on possible flying saucer technology - The revelations of Flugkapitän Rudolph Schriever - the Schriever-Habermohl-Miethe-Bulluzzo flying saucer - The history of Germany's World War II 'Projekt Sauce'' - Other German flying saucer projects: Heinrich Fleißner, Alexander Lippisch, Arthur Sacks, Viktor Schauberger, and Hermann Klaas -The testimony of Georg Klein - Crashed saucer at Spitsbergen, Norway - CIA suspicions about Soviet and Canadian flying saucers - From the Feuerball *to the* Kugelblitz.

Chapter 5

Spinning Disks and Flying Saucers

UFO debris - The Maury Island Mystery - UFOs described as spinning disks and flying saucers - Sighting reports by trained personnel - The Air Force takes notice - Defined UFO characteristics - The boundary layer reappraised: Suction wings and humped airfoils -The death of Captain Thomas F. Mantell – The 'classic' sighting by pilots Clarence S. Chiles and John B. Whitted - The Air Force is finally convinced - Confirmation of UFO sizes and speeds - Navy Commander R. B. McLaughlin - Three positive cases cited by Captain Edward J. Ruppelt - Confirmation that UFOs are intelligently controlled vehicles - UFOs finally accepted as genuine phenomenon.

Chapter 6

The UFO Invasion

Cinetheodolite camera stations of the White Sands Proving Range -UFO photos and films - The Lubbock lights - The Fort Monmouth Sightings - Air Technical Intelligence Centre (ATIC) investigates - The Pentagon is informed - The UFO 'invasion' of Washington D.C. - The White House is surrounded - Ruppelt is frustrated - Retractions and disinformation - Operation Mainbrace - A growing belief in US flying saucers.

Chapter 7

The Man-Made Flying Saucers

US concern that the flying saucers are of Russian origin - the flying saucer of Jonathan E. Caldwell - UFOs seen most often over top-secret military areas - First mention of flying saucer project at A.V. Roe, Canada - Russians planning to build Horten 'flying wing' aircraft – From flying wings to flying saucers -The US Navy's Flying Flapjack - The US News and World Report *speculates - Similarities between Flying Flapjack and UFO sightings over the White Sands Proving Range - Flying Flapjack project dropped and prototype stored with Smithsonian Institution - New flying saucer project at AVRO Canada, Malton, Ontario - The photograph of Jack Judges - The Avrocar is unveiled* - The Royal Air Force Flying Review *confirms - Canadian Minister of Defence announces the termination of the project - US Air Force Secretary announces new flying saucer project - The Frost flying disk - Reporters allowed to view the Frost saucer - The flying saucer described - Comparison between Frost saucer and Lubbock sightings - Canadian and US government announce end of saucer projects - Possibility of Soviet, Canadian and US flying saucers based on World War II German designs.*

Chapter 8

UFO Landings and UFOnauts

Dr J. Allen Hynek - Four kinds of UFO contact - The dubious claims of Frank Scully - Crashed saucers and frozen alien corpses - The mysterious Hangar 18 - Senator Barry M. Goldwater and astronaut Gordon Cooper - A collection of UFO landings - More landings at Holloman AFB - The Roswell incident analyzed - Investigations of Roswell incident by William Moore and Stanton Friedman - Roswell recollections of W.W. Brazel - The crash at Magdalena - The Socorro incident analyzed - Examination of the Socorro landing site - Investigations of the Socorro incident by Ray Stanford - The UFO insignia - The possibility of a man-made craft from the White Sands Proving Range.

Chapter 9

UFOnauts and Close Encounters

The Freedom of Information Act - From World War II technology to the modern UFO - The White Sands Proving Ground - The case advanced for man-made, disk-shaped aircraft - CE-IV, or Close Encounters of the Fourth Kind - The fantasy of George Adamski - Some other farfetched abductee stories - The New Hampshire case -The Pascagoula case - Dr James A. Harder's automata - The CE-IV at Alamogordo - Hypnotism, paralysis and psychosomatic illnesses - Other famous contactee cases and their UFOnauts - Explanations within the present technology - Mental and physical mind control - Floating contactees and UFOnauts - A reason for amnesia - Dr Walter Hess and electrode implantation - The robotizing of the human being - Experiments behind closed door - Computer-controlled implanted humans - Artificial organs and synthetic skin - Myoelectric prosthetics and other surgical nightmares - The most extreme operation known to surgical science - David Fishlock's Man Modified - *Vance Packard's* The People Shapers - *Human guinea pigs - Harvesting the living dead - Head transplants and two-headed dogs - The lack of legal, ethical and religious restraint - Man-machine interaction, including phantoms, CAMS, and exoskeletons - Thought control of man-machine manipulators and advanced prosthetics - Ethics in medical progress - The case for the cyborg.*

Chapter 10

UFO Technology

Interpretations of cinetheodolite data - UFO shape and size - CAMS and RMS - the mother ships - Composition of UFO metal - James M. McCampbell and UFOlogy - Nitinol: the 'magic' metal - Dr James A. Harder and 'Looking at the Evidence' - Porous metals and plasma glows - UFO invisibility - The F-117 Stealth night fighter and the Aurora - Analysis of the Lubbock photographs - Luminosity and colours - electromagnetic radiation - UFO flight characteristics - Intelligence gathering on UFO propulsion systems - Atmospheric ionization - Antigravity and gravitic propulsion - Antigravity shields and the inertial force - Unclassified and classified gravity projects - Stanton T. Friedman on fission and fusion propulsion - Friedman on ionization systems - A secret flying saucer project - UFO spin and stabilization - Renato Vesco's Intercettateli Senza Sparare - *The Kreiselgeräte and gyroscopic control - UFO currents and slipstreams - Electromagnetic radiation and microwave energy - Paralysing and mesmerising light beams - Low frequency sounds - Lyall Watson's* Supernature - *Laser-beam technology and radiation weapons - Mechanical cloud-busters and orgone weather-engineering - Conclusion: the UFOs could be man-made*.

Chapter 11

Speculations on Terrestrial UFO Bases

Unidentified Submarine Objects, or USOs - The case for and against the Bermuda Triangle - Charles Berlitz's Without A Trace *- Connections with the Devil's Sea - Magnetic aberrations - Dr Manson Valentine's theory of dematerialization - Undersea laboratories and USO bases - Back on dry land - Renato Vesco's theory of Canadian origin of the flying saucers - The 'hollow Earth' Theory - The Essa-7 satellite photographs - Ray Palmer's theory of holes at the Poles - The exploitation of Rear-Admiral Richard E. Byrd - The Land Beyond the Pole and Rainbow City - What Byrd actually said - The 'hollow Earth' theory disproved - Ice-free areas in Antarctica - Antarctic exploration and territorial claims - Mysticism in Nazi Germany - The 'World Ice' theory of Hans Hörbiger - The lost civilisation of Thule - Nordic man and the Master Race - Heredity research, anthropological experiments, and human breeding colonies - Nazi secret weapons and underground spaces - The Antarctic voyage of Captain Alfred Rischter - Neu Schwabenland is created and protected by German gunboats - Submarine U-977 - An Argentinean connection - The International Geophysical Year (IGY) OF 1957-58.*

Chapter 12

Disinformation and the International Cover-Up

First intelligence investigations at Wright-Patterson AFB - General Nathan Twining says the phenomenon is not fictitious - Project Sign is established - The Air Technical Intelligence Centre (ATIC) is formed - Project Sign's Estimate of the Situation - FBI checks through criminal and subversive files - Project Sign renamed Project Grudge - The investigation shifts from the UFOs to those who report them - The debunking public relations campaign of Project Grudge - Termination of Project Grudge - Captain Edward J. Ruppelt and Project Blue Book - General Hoyt S. Vandenberg - The Robertson Panel - Summary of findings of Project Blue Book - Theodolite pictures and UFO movies - The notorious recommendations of the Robertson Panel - Arthur Godfrey and Walt Disney Productions - AFR 200-2 and JANAP 146 - Some reasons for secrecy - The inexplicable fate of ATIC's visual tracking stations - Project Ivy - Captain Ruppelt's The Report on Unidentified Flying Objects - *The Ad Hoc Committee to review Project Blue Book - Controversial sightings at Hillsdale and Dexter, Michigan - The first congressional hearings - The Condon committee and its report - Termination of Project Blue Book - Problems for UFO groups and the fate of Dr James E. McDonald - Official silence begins - Howard Blum and the UFO Working Group - Conclusion: the government is protecting man-made flying saucers.*

Chapter 13

The Case Summed Up

A brief review: the Great Airship Scare of 1896-97 - German enthusiasm for the work of Robert H. Goddard - Balls of fire and Projekt Saucer - The Feuerball *and the* Kugelblitz *- The fate of the Projekt Saucer team - Post-war achievements in rocketry and spaceflight - The Canadian connection -* Brisant *magazine and neo-Nazi speculations - German saucers in Antarctica - Rear-Admiral Richard E. Byrd's Operation Highjump - The United States withdraws from and returns to Antarctica - Canadian and US saucers for use in the polar regions - International cooperation in outer space and Antarctica - The obscure origins of* Brisant *magazine - Ernst Zundl, Samisdat Publishers, and neo-Nazi UFO theories - The Argentina-Antarctica connection - Captain Ernst Schaeffer and U-977 - The shipping of men and materials to hidden Antarctic colonies - Underground factories in Nazi Germany - Another hypothesis: international cooperation - A reappraisal of the International Geophysical Year (NYG) of 1957-58 - Nightmarish reasons for an international conspiracy - The case for man-made UFOs summed up*.

Introduction

After all these years…

‘**In 1945** Allied pilots submitted reports which described mysterious “fireballs” that tailed their aircraft during night missions over Germany. **In 1950** a now-declassified CIA document revealed the agency’s concern that “a far advanced German science” was the origin of the many flying saucers sighted since the end of the war. **In 1952** a secret US Air Force Memorandum for the Record stated: “Discussions with astronomers have produced an argument which seems to exclude non-terrestrial origin of the saucers.” **In 1953** a now-declassified CIA report revealed that Air Force engineers at the A.V. Roe Company were engaged in the construction of a flying saucer prototype based on World War II German designs. **By 1960** many people were claiming, even under hypnosis, that they had been abducted by “aliens” in flying saucers and submitted to unusual painful surgical examinations. ***By 1970*** eminent surgeons and biotechnicians were openly discussing experimentation with microelectric control of the brain, surgical mutation to produce cyborgs for work in outer space, and other forms of nightmarish science. **In 1990** an award-winning American reporter revealed that the US government had formed a top-secret UFO Working Group whose members met regularly in the Pentagon. Finally, **in 1995**, after a decade of research, bestselling author W.A.Harbinson has produced *Projekt UFO: The Case for Man-Made Flying Saucers* – arguably the definitive UFO book.’

So said the dust-jacket of the hardcover edition of this book, originally published in 1995 by Boxtree, London. It was a fairly accurate description of the contents. Alas, when the paperback edition was published a year later, an enterprising editor had written a shorter description, most likely without reading the book. In this new cover-text it was claimed that ‘Harbinson offers proof that UFOs come not from outer space but are the result of a secret ex-Soviet project…’ By adding, ‘Furthermore, the Soviets lifted most of their technology from the Nazis,’ the editor managed to emphasize even more that the book was about secret *Soviet* flying saucer construction projects. The US and Canada, clearly shown in the book to be the major perpetrators, weren’t

even given a mention.
Alas, I was not shown a copy of the cover until the paperback had been printed and bound, by which time it was too late to correct the misrepresentation. As readers of the first edition of this book will know – and as readers of this new edition are about to find out – *Projekt UFO* is actually about joint US-Canadian flying saucer construction projects, with the Soviets playing only a minor role.

Of course, to even mention such misrepresentation is to invite UFO conspiracy theorists to insist that it was a clandestine attempt, possibly engineered by British, Canadian or US Intelligence, to shift attention away from the true source of the man-made flying saucers. This is not too much different from what happened when I, then a fledgling writer, naïvely gave the original publishers of my novel *Genesis* my only copy of the German magazine, *Brisant*, instead of a photocopy. Naturally, they lost it. In this instance 'lost' almost certainly means 'lost', but for years after the publication of the novel I was to read articles (mostly on the Internet) claiming either that *Brisant* had never existed in the first place or that my copy, a true rarity, had been 'stolen' from the publisher's offices. To this was added the novel theory that I had been tasked to write *Genesis*, the subsequent 'Projekt Saucer' series of novels based upon it, and, one must suppose, this non-fiction work, in order to deflect attention from the *true* source of the flying saucers. I had been tasked to do this either by the National Security Agency (NSA), which sought to deflect attention from their real 'black' technology projects (research programs so highly classified that they cannot be identified publicly), or by the extraterrestrials themselves, who, having 'brain-implanted' me without my knowledge, were using me, as an author of *man-made* UFO books, to deflect attention from their regular incursions into Earth's atmosphere in their own flying saucers.

Paranoia stalks the world of the UFOlogist. Naturally, I cannot prove that I am neither a NSA agent nor the victim of an extraterrestrial brain-implant, but can only use this space to insist that I am neither. In defence of my normality, I will even confess that I have never seen what I personally would consider to be a flying saucer. But, like physicist Stanton T. Friedman, quoted at the front of *Projekt Saucer*, defending his own admitted lack of UFO sightings: 'I've never even seen Australia, but it's there.' So while not sharing the paranoia of my fellow UFO conspiracy theorists, I would simply

like to say that while I myself have doubts about certain theories put forward in this book, the technology described in it, much of it black technology, is still ongoing behind closed doors and cannot be stopped.

An update on such technology and other related UFO matters has been added as an Afterword to this new edition.

W.A.Harbinson

Acknowledgements

When planning this book, I decided from the onset to avoid the prejudices and misinformation of those with vested interests. This I did by taking the unprecedented step of researching without recourse to the major UFO organisations or individual UFOlogists, even where reportedly reliable. Instead, I focused on the literature, tried separating the wheat from the chaff influenced by nothing other than my own judgement, and otherwise relied only on the following, none of whom, to the best of my knowledge, belong to UFO groups or are blinded by an obsession with the subject.

My thanks to: Adam Webb, writer, researcher and computer wizard for his generous supply of video-and-cassette tapes, an introduction to cyberspace, and written information on a variety of UFO-related subjects. Bob Turner, Fleet Street librarian, writer and researcher, for valuable articles. Perrott Phillips, writer and editor, also for valuable articles. Ken Welsh, photographer and writer, for photographic assistance, great trips and moral support. Paul Grzybowski, for vintage newspaper accounts of the Great Airship Scare in general and the mysterious Mr Wilson in particular. Ruediger and Hannelore Vogt for assistance with German research and illustrations.

Thanks, also, to my former wife, Ursula Mayer, for the German translations; to her late brother, Willi Mayer, for giving me the information that kicked off the whole project; and last but not least to the late Alan Earney, an editor who liked writers and had faith in this project when it began as a novel, *Genesis*, many years ago.

W.A. Harbinson

Foreword

In May, 1978, at Stand 111 in a scientific exhibition in the Hanover Messe Hall, some gentlemen were giving away what at first sight appeared to be an orthodox scientific newspaper called *Brisant*. The paper contained two seemingly unrelated articles: one on the scientific and ecological value of the Antarctic, the other about a German World War II flying saucer construction program named 'Project Saucer' (*Projekt Untertasse*).

The first article, written from a neo-Nazi standpoint, included an assertion that West Germany should claim back their right to Queen Maud Land in the Antarctic, which the Nazis stole from the Norwegians during World War II and renamed Neu Schwabenland. The second article, which asserted that the German scientists were the first, but not the only ones, to construct highly advanced saucer-shaped aircraft, was accompanied by reproductions of technical drawings of a World War II flying saucer.

The unnamed author failed to name the designer of the flying saucer and claimed that the drawings had been altered by the West German government to render them 'safe' for publication. Adding weight to his claim, he also pointed out that during the Second World War, all such inventions, whether civilian or military, would have been submitted to the nearest patent office where, under paragraphs 30a and 99 of the *Patent-und Strafgezetsbuch*, they would have been routinely classified as secret, confiscated, and passed on to one of Himmler's many SS research establishments... and at the end of the war some of those patents disappeared into secret Soviet files, others disappeared into equally secret British and American files, and the remainder disappeared with 'missing' German scientists and SS troops.

The rest of the article was just as intriguing. It claimed that throughout the course of World War II the Germans sent ships and planes to Queen Maud Land, or Neu Schwabenland, in the Antarctic with equipment for massive underground complexes, similar to those they had constructed in Thuringia and the Harz Mountains, in Germany; that at the end of the war, some of the scientists and engineers who had worked on Project Saucer escaped from Germany by submarine and ended up in an underground base in the Antarctic, where they continued to construct even more advanced flying saucers; and that the Americans and Soviets, upon learning about this, then used their captured German scientists and technical papers for the secret

construction of their own flying saucers.

This theory would explain why, even before glasnost, all the nations of the world, even the Soviets and the Americans, had cooperated with one-another only in the Antarctic.

In short, the flying saucers seen by so many people since World War II, are not extraterrestrial spacecraft, but are, in fact, extraordinarily advanced, top-secret, man-made machines.

They come from right here on Earth.

An unlikely scenario or a frightening truth?

Intrigued by this material, but uncertain of its veracity, I decided to turn it into a work of fiction. During my two years of intensive research, I uncovered written and photographic material which proved beyond doubt that Nazi Germany had in fact initiated a research program for the development of saucer-shaped aircraft; that at the close of the war seasoned Allied pilots were submitting official reports about harassment by 'balls of fire' that tailed them and made their aircraft and radar malfunction; that one of the leading members of Germany's Project Saucer development team disappeared into the Soviet Union and another went to work with German rocket expert, Werner von Braun, for NASA, in the United States; that most of the known post-war 'tailless' aircraft and 'flying wings' were constructed in the wilds of Canada; that the Canadian AVRO flying saucer, the existence of which was officially denied until it was photographed illicitly by an American journalist, was later handed over to the US, all too publicly proclaimed to have been a failure, then placed on display in the US Air Force Museum in Fort Eustis, Virginia; and, finally, that articles about man-made flying saucers, including the German *Kugelblitz* and the Canadian AVRO-Car prototype, had been published not only by the 'lunatic' fringe but by highly respected aeronautical magazines such as *Luftfahrt International*, the *Royal Air Force Flying Review*, and the *US News & World Report*.

So flying saucers, whether primitive or highly advanced, were certainly constructed in Nazi Germany and post-war Canada, in the latter case with the aid of the United States.

In 1980, my 615-page novel, *Genesis*, based on a mass of research material, including that mentioned above, was published. It became a bestseller on both sides of the Atlantic, eventually dropped off the bestseller lists, but then became a 'cult' book, and now, ten years after its publication, it remains in

print.

Reviewing the novel on its publication in the US, *Publishers Weekly* said: 'Harbinson has drawn so heavily on factual material and integrated it so well into the text that the book begins to read like non-fiction...' This conclusion was drawn by other reviewers and over the years I received many letters from readers who obviously thought the same and asked me to tell them which parts of the book were fact and which were fiction.

Since responding individually to those many requests would have been an exhausting endeavour, I naturally avoided doing so. However, a continuing fascination with the subject, encouraged by the new, often startling data that continued to come my way via readers, UFO organisations and my own researches, eventually encouraged me to expand the original novel into a five-book series, *Projekt Saucer*, which would include much of this new material. It also convinced me that there was enough material for a non-fiction book on this unique, intriguing and often frightening subject.

The following pages are an attempt to separate fact from fiction regarding whether or not UFOs, or, more accurately, flying saucers, originate right here on Earth and have been designed and constructed, possibly in secret cooperation, by European, Soviet, Canadian and American scientists.

If the facts contained herein point to man-made flying saucers, then what we are faced with is an unprecedented, international cover-up... and the most nightmarish official secret of our times.

The facts are as follows..

Chapter 1

Biblical and Other Historical UFO Sightings

Ancient monuments, artifacts, paintings and written records bear eloquent witness to the history of man's visions and rationalizations for the unknown, showing gods, devils, angels, ghosts, sundry monsters, winged chariots, flying ships and shields, and other magical manifestations in an eternal struggle between good and evil, which changes, with the passing of time, only in its externals.

The gap between flying carpets and flying saucers is not all that large. Both may be serving a purpose for different ages and cultures: to explain the inexplicable, make sense of the unknown, reduce mysteries to comprehensible terms, make real what seems unreal. Only in the light of modern atmospheric and astrological knowledge have we come to learn about comets, meteors, lenticular and noctilucent clouds, dust and ice crystals, temperature inversions, corona discharges, plasmoids, ball-lightning, parhelia and paraselenae, or mock suns and sundogs, mock moons and moondogs. In ancient times such phenomenon were viewed as mystical visions or visitations by the gods of the sea or sky. In modern times they are mistaken for UFOs.

The term 'flying saucers' was coined only in 1947, but UFOs, or Unidentified Flying Objects, go back to the dawn of time.

What appear to be unusual flying objects, often disk-or cigar-shaped, have been found in prehistoric cave drawings. The earliest written record of a strange object in the sky is by the Egyptian Pharaoh Thutmose III, circa 1504-1450 B.C. Aristotle, the fourth century B.C. Greek philosopher, made references to 'heavenly disks' and claimed to have seen a meteorite fall at Aegospotami, rise up in the wind, and descend elsewhere. The first century B.C. Roman historian, Livy, recorded phantom ships gleaming in the sky, an 'altar' surrounded by men in white clothes which was seen in the sky at Hadria in 214 B.C., and approximately thirty other celestial phenomena, some of which have since been interpreted as descriptions of UFOs. Also of

great interest to modern UFOlogosts are the references by the first century Roman historian, Cicero, to nine celestial phenomena, the most notable of which is his statement that on one occasion the sun was seen *at night*, accompanied by loud noises in the sky, which seemed to split open, revealing strange spheres. During the reign of Alexander the Great, two 'UFO' reports were recorded: in 329 B.C., two shining 'silver shields' dived repeatedly on Alexander's army while the men were attempting to cross the Jaxartes River into India; and in 322 B.C., during Alexander's siege of Tyre, a triangular formation of five round 'shields' circled over Tyre and destroyed its walls and towers with beams of light, thus enabling Alexander's legions to conquer the city. According to Pliny, in 66 B.C. a spark fell from a star, descended towards Earth until it was the size of a moon, then stopped and remained hovering in the sky for a while, diffusing cloudy light. It took the shape of a blazing torch when it returned to the sky.

If a trained, twentieth-century pilot can mistake natural atmospheric phenomena for a flying saucer, what must our distant ancestors have thought about the sky's more magical offerings? UFOlogists of the 'ancient astronauts' ilk repeatedly remind us that many of the IFO (Identified Flying Objects) such as aircraft, weather balloons, rockets and satellites, which are mistaken for UFOs (Unidentified Flying Objects), did not exist in ancient times; but even then, natural atmospheric phenomena offered plenty to confuse the eye and ear - more so given what was then a relatively limited knowledge of the atmosphere.

For instance, it was not then known that the planet Venus, when viewed under certain atmospheric conditions, will appear as a glowing orb that moves in the most extraordinary patterns. Nor was it known that comets, meteors, clouds, plasmoids, corona discharges, parhelia and paraselenae, the sun and moon and stars, even lightning and birds, can all look like bright, solid objects moving at high speed.

Mock suns, or sundogs, are caused by the sun's light, which can reflect an eerie image of the sun onto shifting clouds. Similarly, when the moon is close to the horizon, or when it enters cloud, it can take on strange shapes and colours, giving the illusion that it is in flight or magically hovering - a mock moon, or moondog (paraselenae). Other UFOs are caused when the light of the moon shines on ice particles contained in drifting clouds, making the particles seem like shining, round-shaped objects in flight, in the

phenomenon known as parhelia.

Stars offer many illusions, notably the phenomenon known as ‘atokinesis’ in which a given star will appear to move in the dark sky, sometimes darting about erratically just like a glowing flying saucer. In this context, a cloud obscuring a star can do so in a manner that makes the star appear to streak away at tremendous speed or even ‘go out like a light bulb’ - again, as many UFOs appear to do.

Meteors are minute pieces of rock which flare up as they enter the Earth’s atmosphere and are heated to incandescence by the friction. Mostly white in colour, they often appear as a spectacular streak of light in the sky - and meteor showers, which are common, can look to the untrained eye like a whole formation of UFOs in flight. Larger meteors, which take longer to burn up and seem to move more slowly across the sky in near horizontal trajectories, are known as ‘fireballs’ or ‘bolides’ and are often a spectacular orange or greenish-blue in colour.

Lenticular clouds are formed in circular, dome-shaped layers and, appearing singly or in groups, are often mistaken for domed, disk-shaped UFOs. Even more spectacular are noctilucent clouds, formed miles high in the atmosphere by ice particles and debris, and visible only at night. Given their tremendously high altitude, the sun can reflect off them, even at night, thus causing an eerie crimson luminescent mass, again shaped like a UFO, or flying saucer, that is visibly moving (as the cloud is moving).

A similar phenomenon is caused by temperature inversions: various layers of air, all at different temperatures, which bend and twist and generally distort rays of light to create what is best termed a mirage. Indeed, a temperature inversion can pick out a boat at sea and project it as a vivid mirage in the sky, with its shape often distorted enough to make it resemble a strange flying object. Similarly, given the proper temperature inversion, lights glowing up from the dark earth at night can be bent and sent traveling, then bounce off another temperature inversion many miles away and appear to the observer of the second inversion as a mass of glowing, darting objects.

The highly reflective underbellies of certain birds have often been mistaken for UFOs, as have bioluminescent clouds of insects, various kinds of windblown, light-reflecting debris, and even the natural gases given off from marshlands.

Various forms of lightning can also be mistaken for UFOs. While

‘forked’ lightning is recognizable to even the most untrained eye, ‘sheet’ lightning, which flashes only briefly, can be misinterpreted as a speeding UFO. As for plasmoids, corona discharges and ‘ball lightning’, they are basically formed by electrified gas that when burning brightly oscillates, vibrates, wobbles, flies horizontally, climbs vertically, glows in blue and red colours, and can look like a sphere or disk or a gigantic torpedo. They also hum and make other strange sounds and can be very frightening.

The skies, then as now, were filled with enough bizarre atmospheric phenomena to make those mentioned above believe they were either having mystical visions or witnessing visitations from the gods or other extraterrestrial creatures. But why, in the light of modern knowledge, do so many persist in believing that those ancient monuments, artifacts, paintings and writings were primitive reproductions of UFOs and their occupants?

The widespread, contemporary belief that descriptions of UFOs in general or flying saucers in particular can be found in numerous biblical and other historical writings was first stirred by a string of popularizing ‘factual’ books published during the UFO craze caused by the Kenneth Arnold sightings of 1947 and continuing into the 1960s. The first of these, published in the United States in 1956, was *UFO and the Bible*, written by astrophysicist Morris K. Jessup, who proposed that many of the Bible’s improbable events would seem more probable if read as descriptions of the intervention of alien superintelligences brought to Earth by UFOs. This was followed by the British publication in 1960 of *The Sky People*, in which UFOlogist Brinsley Le Poer Trench, actually the Earl of Clancarty and former editor of *Flying Saucer Review*, paraded a wide-ranging, largely unsubstantiated range of opinions on the theme of extraterrestrials: notably that they had come from the region of the Great Bear, the Little Bear and Sirius, had seeded the human race to create *Homo sapiens*, were still returning periodically to review human progress, and may even have underground bases on Earth for their flying saucers. *The Morning of the Magicians*, by Louis Pauwels and Jacques Bergier, first published in France in 1960, and *One Hundred Thousand Years of Man's Unknown History* by another Frenchman, Robert Charroux, published in France in 1963, were bestselling books that covered a much broader spectrum of esoteric subjects, including the Ark of the Covenant, the Great Pyramid, the lines on the plain of Nazca, the statues of Easter Island,

the Gate of the Sun at Tiahuanaco, the drawings in the caves of Tassili, the Piri Re'is map, and the destruction of Sodom and Gomorrah - all of which, according to the authors, were evidence for Earth's visitation by alien spacecraft and their occupants.

The theories of these authors were later regurgitated and exploited with extraordinary success by the Swedish author, Erich von Däniken, who, more than any other individual, created an almost fanatical, worldwide belief in extraterrestrial intervention in human affairs.

Erich Von Däniken wrote *Chariots of the Gods?* in 1966, the same year that the 'God is dead' movement got under way and *Intelligent Life in the Universe*, a serious work, co-authored by astronomers I.S. Shklovskii of the USSR and Carl Sagan of the US, was published. *Intelligent Life in the Universe* is an attempt between a noted Russian astronomer and a leading American space scientist to speculate on 'the origins of the universe, the evolution of stars and planets, the beginnings of life on Earth, and the development of intelligence and technical civilizations among galactic communities' based firmly on the scientific knowledge of that time. As such, it certainly lent legitimacy to the idea that extraterrestrial life was a distinct possibility. However, ignoring the scientifically based, speculative approach of Shklovskii and Sagan in favour of startling, dogmatic theories based on a combination of selective facts, misinterpretations, outright invention, and the unreliable works of his abovenamed predecessors, Erich von Däniken managed to create, in a series of bestselling books, an immensely popular fantasy of cosmic proportions.

As Ronald Story shows in greater detail in his definitive exposé, *The Space Gods Revealed* (1978), consistency is not one of von Däniken's strong points. In *Chariots of the Gods?* his basic thesis is that alien visitors discovered Earth accidentally, observed that it had the necessary conditions for the development of intelligent life, began breeding experiments on its apelike creatures, artificially fertilized some of the females, and have returned throughout the ages (in flying saucers) to check on the progress of *Homo sapiens* and weed out those likely to hold back the march to civilization. In an era in which skepticism about God and religion was commonplace, even fashionable, von Däniken's view of evolution presented a novel replacement for lost faith. However, in his second book, *The Gold of the Gods*, he offers a

completely different theory.

In this scenario, the extraterrestrials landed on Earth after losing in a cosmic war and fleeing from their enemies in a spaceship. Since Earth's atmosphere was not suited to them, they built a series of underground tunnels in which they hid from their pursuers, and after using various fantastic methods to get rid of their enemies, returned to the surface of the earth, wearing helmets, gas masks and other breathing equipment to help them adjust to Earth's atmosphere (which explains the 'astronaut' drawings found in many prehistoric cave drawings, such as the one in Tassili, in the Sahara Desert). Naturally, once back on Earth's surface, the extraterrestrials manipulated the genes of monkeys to create intelligent human beings in their own image, exterminated those who didn't shape up quickly enough… and so on and so forth.

Von Däniken spiced this rich stew with many of the equally wild theories of Pauwels, Bergier and Charroux. By doing so, he managed to sell millions of copies of his books and spread the belief that man was not created by God or cosmic accident, but by vastly superior, extraterrestrial beings.

Unlikely as it seems, support for von Däniken's theories came from Josef F. Blumrich, member of the American Institute of Aeronautics and Astronautics, the American Association for the Advancement of Science and the American Astronautical Society and, at the time of his retirement in 1974, Chief of the Advanced Structural Development Branch of the National Aeronautics and Space Administration (NASA) and winner of NASA's Exceptional Service Medal.

In a bid to *disprove* von Däniken's claim that the Biblical prophet Ezekiel had witnessed the landing and departure of an alien spacecraft, Blumrich ended up doing the opposite by attempting to design a spacecraft based on Ezekiel's descriptions, then publishing his findings in *The Spaceships of Ezekiel* (1974). With technical drawings, dense scientific prose and, in the words of Ronald Story, 'an extreme form of rationalization', Blumrich attempts to prove that Ezekiel was describing a spacecraft or, at least, some kind of highly advanced helicopter.

As Blumrich's scientific respectability has lent such credence to von Däniken's contradictory ramblings, it may be worthwhile to compare what Ezekiel actually said with what von Däniken and his supporters deduced from it.

In the Book of Ezekiel, Chapter 1, Ezekiel describes how ‘a whirlwind came out of the north, a great cloud, and a fire unfolding itself, and a brightness *was* about it...’ Out of the amber-coloured cloud and fire of this materialization, or supposed spacecraft, emerged four living creatures which had ‘the likeness of a man’. However, while resembling normal men in certain ways, each creature had ‘the sole of a calf's foot’ and ‘the face of a lion’ on the right side, ‘the face of an ox’ on the left side, as well as ‘the face of an eagle’. Each creature also had four wings, which were ‘on their four sides’ and were joined one to another. ‘And their wings were stretched upward; two wings of every one were joined one to another, and two covered their bodies.’ Thus joined together by their wings, which revealed human hands beneath, the creatures ‘turned not when they went; they went every one straight forward.’

Ezekiel goes on to say: ‘Their appearance was like burning coals of fire, and like the appearance of lamps; it went up and down among the living creatures; and the fire was bright, and out of the fire went forth lightning... And the living creatures ran and returned as the appearance of a flash of lightning.’

Proponents of the ancient astronauts hypothesis, including von Däniken and Blumrich, insist that the ‘brightness’ within a ‘great cloud’ and ‘fire’ is a perfect description of a landing UFO; the creatures with the combined features of lion, ox, eagle and calf were astronauts in bulky spacesuits and oxygen masks; the ‘wings’ which revealed human hands beneath were actually the rotor-blades of some kind of mechanical device being controlled by the astronauts; and the ‘lightning’ and ‘appearance of lamps’ from which the creatures emerged and to which they returned are further indications that they were observed leaving and entering a UFO with brightly lit portholes.

In verse 15, Ezekiel states that in the fire and lightning near these creatures he beheld ‘a wheel upon the earth.’ In the following verse, the singular has become plural: ‘The appearance of the wheels and their work was like unto the colour of a beryl... and their appearance and their work was as it were a wheel in the middle of a wheel... When they went, they went upon their four sides; and they turned not when they went.’

By verse 18, this wheel within a wheel has become more machine-like: ‘As for their rings, they were so high that they were dreadful; and their rings were full of eyes round about them four...’ The four living creatures are now

picked up in the fire and lightning, but more importantly: ‘And when the living creatures went, the wheels went by them: and when the living creatures were lifted up from the earth, the wheels were lifted up’ and ‘the spirit of the living creatures was *in* the wheels...’

Ignoring the religious symbolism and insignia in such descriptions and instead interpreting them as primitive descriptions of advanced technology, the proponents of the ancient astronauts hypothesis insist that the ‘wheel in the middle of a wheel’ and the ‘rings full of eyes’ are perfect descriptions of a flying saucer, with its ring-disks revolving around its domed centre and illuminated portholes.

Likewise viewing Ezekiel’s words as primitive attempts to describe highly advanced technology, Blumrich interpreted Ezekiel’s ‘wings’ as rotary blades which made a loud noise while moving (‘And when they went, I heard the noise of their wings, like the noise of great waters, as the voice of the Almighty’: Ezekiel 1: 24) and which folded like wings when not in use (‘When they stood, they let down their wings...’). Basing his experimental work on such assumptions, he then attempted to design Ezekiel’s spacecraft and came up with ‘a capsule on a main body supported by four helicopter units with telescopic legs, retractable wheels and mechanical arms.’

According to Margaret Sachs, in *The UFO Encyclopedia*, Blumrich ‘believes that the robot-like appearance of the helicopter units may have led Ezekiel to describe them as living creatures. And even though Ezekiel later refers to the creatures as cherubim, Blumrich insists that this was because ‘he had realized they were not ordinary men.’

Other UFOlogists are just as insistent on this extraterrestrial interpretation of Ezekiel’s visions. For instance, by Chapter 1:19, the creatures, still joined together each by two of their four wings, are ascending toward the sky inside the wheel-like craft. According to Ezekiel, ‘the likeness of the firmament upon the heads of the living creatures was as the colour of the terrible crystal, stretched forth over their heads above... And above the firmament that was over their heads was the likeness of a throne, as the appearance of a sapphire stone...’

What is actually being described here?

Ezekiel makes it perfectly clear in the first verse of this chapter that he is not describing a real event, but a religious vision, or, in his own words, ‘visions of God’. It is therefore evident that the creatures he describes are

cherubim - a cherub being a winged figure with a human head and animal body. Such mythical creatures are of early astrological significance and can be found in various cultures in the shape of the sphinx and winged bulls and lions. Indeed, since Ezekiel describes his creatures as having the combined features of a 'lion', an 'ox', and an 'eagle,' as well as 'the sole of a calf's foot', it is worth noting that in early astronomy and cosmology, the Lion represents the summer solstice, the Bull the vernal equinox, the Eagle the winter, and the Babylonian 'Scorpion-man' the autumnal equinox.

As we have seen, various atmospheric phenomena look like shining disks or flying 'wheels' and would certainly have been part of the mystical consciousness of the time. As astronomer and astrophysicist Donald Menzel has noted, a common form of parhelia takes the form of a ring of light around the sun, or 'a wheel in the middle of a wheel'. In this particular optical illusion 'a vertical and a horizontal streak of light may cross both rings like the spokes of a wheel'. The wheel is also symbolic of the Sun and the Moon; and in ancient times the wheels of chariots often had the likeness of various creatures carved into them. Thus 'wheel' shapes are common as symbols or insignia in numerous ancient records, as well as in paintings and on artifacts.

In order to interpret 'the likeness of the firmament' that was above the living creatures as something that was solid and had 'the colour of the terrible crystal', the 'likeness of a throne', and the 'appearance of a sapphire stone' - in other words, a second, larger flying saucer, or mother ship - the UFOlogists ignore Ezekiel's earlier statement that he is describing 'visions of God', not real phenomenon. More tellingly, they also ignore the rest of the chapter, which states that 'upon the likeness of the throne' was the likeness of a man from whose loins poured 'the appearance of fire' and who was surrounded by 'the bow that is in the cloud in the day of rain.'

We can assume, then, that this is not a description of another astronaut in a flying saucer, or the mother ship. Rather, as Ezekiel states categorically in the final verse of Chapter 1: 'This *was* the appearance of the likeness of the glory of the LORD.'

In short, a religious vision of God and his cherubim, which made Ezekiel fall to his knees and pray.

As Erich von Däniken and other proponents of the ancient astronaut hypothesis have pillaged most of the Bible for supposed references to ancient

astronauts and their flying saucers, to refute them all would require the whole of this book. It will, however, be instructive to deal with a few of the most often used, or abused, subjects.

According to proponents of the ancient astronaut hypothesis, the Ark of the Covenant was actually an electric condenser or radio transmitter; the Great Pyramid could only have been built by, or with the aid of, extraterrestrials of superior technical knowledge; the lines on the plain of Nazca, Peru, were either runways or landing sites for alien spacecraft; the gigantic statues of Easter Island and the mighty temples of Tiahuanaco could only have been constructed by a highly advanced, therefore extraterrestrial, technology; the drawings in the caves of Tassili, in the Sahara Desert, circa 6000 B.C., are of an extraterrestrial astronaut; the Piri Re'is map, drawn in 1513 by a Turkish general of that name, could only have been completed with knowledge gained from an aerial survey of Earth, therefore by extraterrestrials; and the destruction of Sodom and Gomorrah can only be explained as the result of an atomic or nuclear blast.

What truth is there in these theories?

According to the Book of Exodus, the Ark of the Covenant was a chest built by Moses, under instructions from God, to be used as a repository for sacred objects and carried only by divinely appointed persons. In the Book of Numbers it is stated that a person touching any holy objects in the Ark will die; and in the Second Book of Samuel, a man named Uzzah is struck dead upon attempting to steady the Ark with his hand.

While there is no mention anywhere in the Bible of the Ark being surrounded by sparks, von Däniken claims that it was, that its bearers were instructed to wear special protective shoes and clothing, and that Uzzah was killed by electrocution. However, writer Clifford Wilson argues that since no two pieces of gold on the Ark were separated by an insulator, there was no possibility of there being a negative and a positive plate; that if the ark *had* been charged, it would have short-circuited; and that if Uzzah had truly been killed by electrocution, then so too would have been the bearers of the Ark. Wilson also points out that as God had communicated with Moses before the Ark was built, he had no need of the radio transmitter for the reasons suggested by von Däniken.

The pyramids of Egypt are the oldest of the Seven Wonders of the World and the most famous are the three pyramids at Giza. Of these, the largest is

known as the Great Pyramid and was built by Pharaoh Khufu, or Cheops. According to von Däniken and others, the pyramids could not have been built without the superior knowledge and tools of extraterrestrials. In support of his claims, von Däniken insists that the ancient Egyptians could not have moved the massive blocks of the Great Pyramid with rollers and ropes, as suggested by scholars and archaeologists, since they had no rope or wood at that time. This is nonsense, as the many drawings of these items in Egyptian illustrations clearly demonstrate, as do the dated samples of rope and wood which have been found in the vicinity of the pyramids. Von Däniken also insists that the Egyptians would not have had the capability of levelling the ground for the pyramid so accurately; but various scholars have proven that they could, while a television documentary produced by the British Broadcasting company showed the method most likely used. Von Däniken states that the pyramid's stone blocks were joined together to a thousandth-of-an-inch, which was beyond the capability of the Egyptians; when in fact they are joined together to about two-hundredths-of-an-inch, which certainly *was* within the capability of the ancient Egyptians. Von Däniken claims that it would have taken human workers, unaided by extraterrestrial technology, approximately 664 years to complete the construction; but the archaeological evidence indicates that the Great Pyramid, and others, were built within one century by ordinary human beings - and the study of Egyptian funerary edifices shows a logical, chronological development from small tombs to the true pyramids within the space of two centuries.

No evidence for extraterrestrial intervention in the construction of the Great Pyramid or others has ever been found.

In claiming that the lines on the plain of Nazca, Peru, were runways for alien spacecraft, Von Däniken ignores the fact that contemporary spacecraft, let alone flying saucers or other craft of extremely advanced technology, do not need runways. He also ignores the fact that the surface of the Nacza Plain is not rigid enough to serve as a runway (automobiles and trucks that accidentally run off the man-made roads get stuck in the sandy soil and loose gravel) and the supposed 'runway' is less than one metre wide. Likewise, he ignores the fact that many religious groups throughout history have placed their gods in the skies and created figures and symbolic shapes that can only be seen from the air (even the 'cross' shape of Christian churches can be seen only from the air). Last but not least, in asserting that the Nazca lines could

only have been formed with the help of airborne extraterrestrials, he ignores the fact that small-scale models have been found alongside some of the designs, thus suggesting that the immense figures were merely created from the models by human hands. In fact, when viewed from the air, the lines on the plain of Nacza form the very clear outlines of various totemic birds and animals.

Easter Island, located in the South Pacific, is famous for its hundreds of immense stone statues. As they have done regarding the stones of the Great Pyramid, von Däniken and his followers insist that the enormous weight of the Easter Island statues excludes the possibility of their having been transported and erected by the local people. To this argument von Däniken adds the fiction that the island did not have the wood required to make the rollers necessary for the human transportation of the statues (just as, according to von Däniken, the Egyptians did not have the rope and wood required for the construction of the Great Pyramid), and that the volcanic rock from which the statues are carved is too hard to have been cut with primitive tools.

In fact, although most of Easter Island's trees were destroyed by fire or cleared for agriculture, they once covered the whole island; and in 1955 the famous Norwegian explorer, Thor Heyerdahl, personally witnessed the local natives carve, transport and erect a typical Easter Island statue with primitive tools. According to Heyerdahl (*Aku-Aku - The Secret of Easter Island*, 1958), the outline of the statue became visible after only three days of cutting with primitive tools. Based on this observation, Heyerdalh estimated that even the largest statue on the island could have been completed in under a year. Heyerdalh also bore witness to the fact that 180 men were able to drag the completed statue over the ground to its chosen site with relative ease. Using wooden legs as levers and rocks as supports, twelve men were able to erect a twenty-five ton statue in a period of eighteen days.

So much for extraterrestrial intervention on Easter Island.

Regarding the mysterious civilization of Tiahuanaco, Bolivia, which constructed the great Gate of the Sun, von Däniken claims that a calendar which gives 'the equinoxes, the astronomical seasons, the positions of the moon for every hour and also the movements of the earth' was found in 'the dry mud of Tiahuanaco' and that the beings who 'produced, devised and used the calendar had a higher culture than ours.' This would be fascinating were it

true... however, in the words of Donald Story, 'If this calendar exists, its whereabouts seem to be unknown'.

Von Däniken claims that the rock painting found in a cave in Tassili, in the Sahara, circa 6000 B.C., is of an extraterrestrial astronaut wearing a spacesuit and oxygen mask. In making this claim, however, von Däniken ignores the fact that many similar frescos are to be found in the same area, that they belong to an artistic period known as the 'Period of the Round Heads', and that the work of that period was based mainly on representations of the natives of the area who, in neolithic times, when the rock paintings were done, often wore masks for their religious rituals. The so-called 'spaceman', named by his French discoverer, the archaeologist Henri Lhote, as Jabbaren, or *le grand dieu martien*, is actually a neolithic, ritually masked celebrant - not the 'great god Mars', as suggested by von Däniken.

The Piri Re'is map? Drawn in 1513 by a Turkish general of that name and found in the Topkapi Palace in Istanbul in 1929, the map was based on many earlier charts, including Greek maps dating back to the time of Alexander the Great and one chart used by Christopher Columbus. The Pire Re'is map was considered of particular interest because it appeared to depict the coastlines of the Americas and Antarctica as they could not have been known at the time - particularly since the Antarctic was not discovered until Captain Cook reached it in 1773... 260 years after the map was drawn.

According to von Däniken, this and other ancient maps could only have been drawn by extraterrestrial spacemen from 'space stations in orbit'. To support his claim, he states that the Pire Re'is map is 'absolutely accurate', that 'the contours of the Antarctic were also precisely delineated' on it, and that Professor Charles H. Hapgood had suggested in his *Maps of the Ancient Sea Kings* that the map could only have been made from the air. In fact, as Hapgood's book makes abundantly clear, the Piri Re'is map is notoriously inaccurate, mistaking Cuba for *Espaniola* (now Haiti and the Dominican Republic), omitting almost a thousand miles of the South American coastline, duplicating the Amazon River in two different locations, and showing Antarctica as a landmass joined directly to South America.

Von Däniken claims originality for even this nonsensical theory, but he was actually beaten to it by almost a decade by Louis Pauwels' and Jacques Bergier's The Morning of the Magicians, Donald Keyhoe's *Flying Saucers: Top Secret*, and Robert Charroux's *One Hundred Thousand Years of Ma''s*

Unknown History, none of which are to be recommended for their accuracy. While the Piri Re'is map is one of several that were found in the Topkapi Place, Istanbul, in 1929, Pauwel and Bergier claim that it was found in the middle of the nineteenth century, when Piri Re'is personally presented it to the Library of Congress; Charroux claims that it was found in 1957; Keyhoe claims that a Turkish naval officer submitted a copy of the map, plus the original Christopher Columbus map, to the US Navy Hydrographic Office in 1933, though he carefully omits to name the naval officer in question; and von Däniken, coming desperately late in the game but trying to take credit for it, claims in *Chariots of the Gods?* that the map was discovered in the eighteenth century - though he amends this to the proper date in his later book, *In Search of Ancient Gods*.

As for the destruction of Sodom and Gomorrah, von Däniken plumbs new depths of irrationality by suggesting that the angel's urgency in making Lot and his wife flee from the impending catastrophe indicates that a 'countdown' was in progress and that the biblical account describes a nuclear explosion. The Bible gives not the slightest indication that a 'countdown' was taking place, but it certainly indicates, in Genesis, 19: 24, that 'the LORD rained upon Sodom and Gomorrah brimstone and fire from the LORD out of heaven' and, in verse 28, that 'lo, the smoke of the country went up as the smoke of a furnace'.

The ancient cities of Sodom and Gomorrah were located in the Great Rift Valley, an area that extends from approximately one hundred miles north of Palestine to the southern shore of the Dead Sea and has been subject to earthquakes since time immemorial. Geological and archaeological evidence indicates that the cataclysm described in the Book of Genesis did take place approximately 2000 B.C. in the form of an earthquake accompanied by explosions of a natural gas formed by the large quantities of oil, asphalt and sulphur, or brimstone, in the area.

It can reasonably be assumed from this that Sodom and Gomorrah were destroyed by a dreadful, but otherwise natural, earthquake and that extraterrestrial intervention had nothing to do with it.

Proponents of the ancient astronauts hypothesis are quick to grab at anything that lends legitimacy to their fanciful, unsubstantiated theories. Thus, Erich von Däniken is eager to point out that an 'outstanding technician' (Josef Blumrich) has taken his proposals seriously; just as countless numbers of

UFOlogosts are deeply impressed by the fact that Brinsley Le Poer Trench is actually the Earl of Clancarty and a member of the House of Lords in London, England.

It may be *because* he is a member of the House of Lords, with all the power and prestige that goes with it, which accounts for the fact that the Earl of Clancarty, formerly of the Nautical College of Pangbourne, the Standard Bank of South Africa, the Royal Artillery, and the *RAF Flying Review* and *Practical Gardening*, managed in his lifetime to become Editor of *The Flying Saucer Review*; President of the worldwide UFO organization, Contact International; Vice President of the British UFO Research Association (BUFORA); an Honourary Life Member of the Ancient Astronaut Society; and head of a House of Lords All-Party UFO Study Group; as well as the author of numerous books about UFOs and their occupants. Certainly it was not due to the quality of his research or writing.

What von Däniken, Clancarty, and the others mentioned above, share is a naked desire to read ancient astronauts and flying saucers into biblical descriptions of earthquakes, volcanic eruptions, dust storms, lightning, other atmospheric phenomena, and visions filled with the religious symbols or insignia of the period. What they also share is a talent for misinterpretation, selective omission, wilful distortion, and even outright invention when it comes to analyzing the facts and figures of ancient history.

Perhaps the most notorious example of this is Erich von Däniken's 'blacked out' reproduction and accompanying explanation for the drawing on the lid of a Mayan sarcophagus, or coffin, found in the Temple of Inscriptions in Palenque, Mexico, in 1952. By deliberately blacking out various traditional Mayan elements in the painting reproduced in his book, von Däniken hopes to persuade us that the resulting work is a depiction of an ancient astronaut piloting a rocket. In fact, in the original, drawn from the incised stone by Agustin Villagra, the traditional Mayan elements show it to be a representation of the Mayan ruler, Pascal, suspended between the worlds of the living and the dead, with a quetzal bird (blacked out in von Däniken's reproduction) symbolizing the dawn, or the rising of the Sun God, perched on top of a cross, which is made of stylized corn plants, symbolizing fertility. The skull-like monster below Pascal's chair, when not partially blacked out by von Däniken, clearly represents the world of the living, or Earth.

As Colin Wilson says in *The Directory of Possibilities*, most of the

evidence for ancient astronauts ‘collapses on close examination’. Wilson also reminds us that the ancient-astronaut theory depends heavily upon the assumption that our ancestors were primitive and unsophisticated creatures, only one degree more intelligent than gorillas, whereas an increasing body of evidence suggests quite the opposite: that Neanderthal and Cro-Magnon Man were more civilized and inventive than suggested by von Däniken, Clancarty and Co.; that they carved stones into spheres and disks (which suggests Sun worship, rather than UFOs), and painted the Moon on their cave walls; and that they would not have needed the assistance of a superior intelligence from outer space to invent the wheel or build their megalithic monuments.

To conclude: UFOs, or Unidentified Flying Objects, were commonplace in the past; flying saucers and extraterrestrials were not.

Chapter 2

The Great Airship Scare of 1896-7

The term ‘flying saucer’ was coined in 1947 with the Kenneth Arnold sightings, as mentioned in Chapter One. However, the first known use of the word ‘saucer’ in relation to an unidentified flying object was actually made in the *Denison Daily News* of Denison, Texas, on 25 January 1878, when it recorded that farmer John Martin, of Dallas, had reportedly seen a large, orange object in the sky, which was ‘the size of a large saucer and evidently at great height’.

This isolated incident was followed nearly two decades later by the first truly contemporary UFO flap: the Great Airship Scare of 1896-1897. The two best reports of this extraordinary event are to be found in *The UFO Controversy in America* by David Michael Jacobs and *UFO Exist!* by Paris Flammonde. We can summarize the major events from these excellent works.

According to Flammonde, the prelude to the major UFO, or mystery airship, flap began modestly enough in late October 1896, when a Miss Hegstron caught sight of a glowing light in the sky near her home in San Francisco. However, the real flap began on 1 November when a mountainman and hunter named Brown related to a newspaper reporter that he had seen an ‘airship’ in the morning sky over Bolinas Ridge, near the city. Brown was adamant that what he had seen was not a light at night, but an ‘airship’ in broad daylight, albeit slightly obscured by the morning mist. This was followed by a brilliant white light that was witnessed by hundreds of people as it moved across the sky on the evening of 17 November. One witness, while unable to verify that what he saw was an actual craft of some kind, was adamant that the light had been moving *against* the wind at an altitude of three or four hundred feet. Another witness confirmed that the object was moving into the wind and added that while it was too far away for its specific shape to be distinguished, it carried ‘controlled illumination’ and moved like ‘a seagoing craft ploughing rough water’. Countless other witnesses saw the traveling light and many stated that it was being manipulated to sweep both land and sea as if to avoid collision with high

buildings or mountains. All of those who reported seeing the actual craft from which the light was beaming described it as being a large oblong shape with flattened ends, or an ovoid; though opinions differed as to whether its small passenger cockpit was located above the main body or was dangling underneath. Some witnesses insisted that they had seen members of the craft's crew; others swore that they had heard voices drifting down from the object.

As to be expected, that sighting led to an outbreak of wild newspaper speculation, misidentifications, hysterical imaginings, and hoaxes; but based on the more reliable sightings, the great airship was moving southwards and eventually, on the evening of 20 November, was observed by thousands of people as it glided across the sky over Oakland, California. One witness noted that apart from its large lamp, it had 'wings or winglike propellers' and was heading across the bay. This appears to be true, as the light beaming from the craft was later witnessed by inhabitants of the Mission area as it moved across Twin Peaks. Other sightings were made the next day and the following night, and all reported that the 'light' or 'enormous flying device' was heading southwards.

While an inflamed public imagination led to many fantastical, Jules Verne styled newspaper and magazine reports, individual witnesses were surprisingly consistent in what they described: an egg, cigar or ovoid shape; an up-and-down or 'wavy' flight pattern (like 'a seagoing craft ploughing rough water'); an upper cockpit or suspended gondola; and a light, often compared to an arc lamp, that swept to and fro, surveying the hills or township below. There was also general agreement that the craft was intelligently controlled.

The 'hoax' element raised its ugly head again when a lawyer from Alameda, George D. Collins, claimed that he was the personal representative of the 'inventor of the remarkable airship'; but after causing a nationwide press sensation with his claim, Collins recanted and the man named as the inventor, a dentist named E.H. Benjamin, insisted that he had nothing to do with airships or any other kind of aeronautical craft. Within twenty-four hours of this disclaimer, W.H.H. Hart, former attorney general of the State of California, announced that he was in charge of the 'destiny' of the airship, that this had come about because of Collins' 'inability to exercise discretion in his relationship with the press', that the real inventor of the airship was a

Dr Catlin, and that the dentist, E.H. Benjamin, despite his denials, had been Catlin's assistant. Finally, even though the United States was not then at war with Cuba, Hart announced that the airship, with only two or three men, could be used to destroy the city of Havana within forty-eight hours. Not satisfied with this, the former attorney general then announced that the airship's inventor was 'the cousin of the electrician of General Antonio Marco, commander of the patriotic forces in Cuba.'

The use of Cuba is interesting in the light of later events (see below), but what remains most fascinating about Hart's highly voluble involvement in the Great Airship Scare is that it confused serious enquiry, opened the door to spurious 'official' pronouncements on the nature and purpose of the unidentified flying object, and made it more difficult to discover the truth - in other words, an early example of 'disinformation' with regard to UFOs.

Nevertheless, the great airship, or airships, continued to fly, with the sightings ranging from Tacoma, Washington, to southern California. The first actual 'contact' with the occupants of an airship was reportedly made in the morning of 2 December on the beach near Pacific Grove, a village north of San Francisco. According to the witnesses, there were three occupants and the airship was about twenty yards long, cigar-shaped, and had wings that could be folded against the fuselage of the craft. Many discounted this sighting when the witnesses reported that the three occupants had managed to lift the airship and carry it away from the beach, into hiding. The report of an airship crashing near Twin Peaks, San Francisco, during the following night was likewise treated with some skepticism and was almost certainly a newspaper invention.

A lull in the sightings between late 1896 and the first months of 1897 was followed in April by an even greater number of truly startling sightings, now spreading out from California to sweep across the whole country. With what some thought was exquisite timing, the great airship suddenly appeared over Kansas City, Missouri, at approximately eight o'clock in the evening of April Fools Day 1897. For over an hour the craft's lamp swept the streets, rooftops and bluffs upon which the public, including the governor and other officials and professional people, gathered to observe the phenomenon. From these and other witnesses it was apparent that what was observed, apart from the sweeping light, was a large dark mass that could perform manoeuvres or hang motionless in the air. In the words of the New York *Sun* of 3 April

1897: ‘the powerful lights on board were reflected on the cloud[s] and the outlines of a ship about thirty feet long apparently were clearly distinguished’. The mystery craft remained above Kansas City for ninety minutes, then ascended and moved off, eventually disappearing in the northwest. Shortly after, there were reports from the town of Everest, sixty miles away in the neighbouring state of Kansas, that an unidentified light had passed overhead.

The next night, the phenomenon appeared over Omaha, Nebraska, and was ‘broadly recognized as a very real airship’. By the following evening it had reached Topeka, where it reappeared on several consecutive evenings, before disappearing and turning up again over Omaha, where, according to the New York *World* of 7 April 1897, ‘it was the first time the outline of the vessel could be clearly seen’. Many brothers of the local Ak Sar Ben organization saw it and one of them described it as having ‘a steel body, the length of which could only be estimated at thirty feet’.

As we shall see later, the ‘steel’ body could in fact have been thin aluminium, but certainly, whatever the craft was made of, by 7 April it had travelled a good distance eastward to appear over Sioux City, Iowa, where one witness described it as ‘a big cigar-shaped balloon... about thirty-five feet long, ten or twelve thick...underneath it was a car... it had a row of windows along the side and the light shone through them.’

As Flammonde points out, by this time ‘the growing catalogue of sightings makes it extremely difficult to attribute all of them to a single craft. The “high speeds” described were relative and not impressive by contemporary standards...’ Therefore ‘the large number of communities reporting UFOs at the same time makes the conclusion of more than one vessel reasonable.’

Whether one or many, by this time the mystery craft had been observed by thousands of people and there was increasing consistency about the descriptions of its major features. According to the majority of reports, it was some kind of balloon, approximately thirty or forty feet long, with folding wings along its side, a passenger gondola, a directable searchlight, and smaller green, red and white lamps. The majority of the witnesses were in agreement that the airship carried three crew members (at least two reports contradicted this by stating six crew members). The majority of witnesses also described the balloon as making ‘hissing’ noises and swore that the

airship was under control and could manoeuvre or hover in the air. Practically every report confirmed that the directable searchlight was used to survey the terrain or townships below.

The craft kept traveling. On 10 April a newsstand dealer, Walter McCann, managed to take two photographs when an airship flew over Rogers Park in Illinois - an event which was witnessed by three other men and which was lent further credibility by the fact that numerous other people in the vicinity reported seeing such a craft at approximately the same time. Those photographs were reproduced in a couple of newspapers - the *Chicago Times-Herald* and the *New York Times*. While the former reproduced a pen-and-ink etching of the photograph and claimed that the etcher's 'expert' analysis had concluded that the photograph was genuine, its rival, the *Chicago Tribune*, after also reportedly having the photograph examined by an expert, claimed it was a fake. Nevertheless, true or false, the photographs showed a vessel shaped like an elongated ovoid which, according to Flammonde, had 'the appearance of a large silk envelope, below which was a cabin of light construction, giving the appearance of white metal'.

Shortly after this sighting, there were newspaper reports that a mystery airship had crashed near Kalamazoo, Michigan. Reportedly, the crash was witnessed by 'two old soldiers' and corroborated by a local, Mrs Wallace, who claimed that her family had heard the noise of the crash, or explosion. It was also reported that parts of the machine had been found scattered over the area, some as much as two miles apart. Whether this was true or not, the reported 'crash' was followed by more mystery airship sightings from other parts of Michigan, as well as Oklahoma, Kansas, Illinois and Indiana. By 15 April another airship appeared over Chicago where, according to one account, it descended to approximately six hundred feet above the earth. Quoted in the New York *Herald* of 15 April 1897, witness G.A. Overocker stated: 'The lower portion of the airship was thin, and made of some light white metal, like aluminium. The upper portion was dark and long, like a big cigar, pointed in front and with some kind of arrangement in the rear to which cables were attached [see description of the 'Pennington' airship, below]. The pilot pulled these and steered the course from south to northeast... I can swear that I saw an airship.'

Daytime sightings were rare, but there was a remarkable one on 16 April when citizens of Linn Grove, Iowa, watched an airship pass slowly overhead,

then land briefly a few miles outside town. Viewed by other citizens from a distance estimated at about two-thousand feet, the airship was described as having ‘a twin pair of huge wings’. Even more mysteriously, when it took off again, it discharged ‘two large boulders of unknown composition’ - an incident that would be repeated during the famous Maury Island UFO sighting of 1947.

Meanwhile, mystery airships were being seen elsewhere, with further sightings over the San Francisco bay area. More importantly, a fisherman on Lake Erie, Cleveland, Ohio, got a close look at a forty-foot craft. He mistook this for another boat until ‘an enormous, elaborately decorated, cylindrical balloon, approximately fifty feet in length, inflated’ and ‘swept the boat and its occupants at least two hundred yards into the sky, where it circled several times’. According to the witness, the airship’s occupants were a young man, a woman, and a boy, one of whom threw out a large swordfish as the craft ascended.

At roughly the same time there were sightings as far apart as Missouri, Iowa, Tennessee, Kentucky, and several towns in Texas - which certainly suggests that more than one airship was crossing the country. A report of a daytime landing in Iowa led to press descriptions of a vessel ‘forty feet long, constructed of varnished canvas stretched over a cigar-shaped frame and surmounted by a cockpit. It had wings, some kind of rudder, and a tail pipe exuding steam.’ On 18 April a craft was sighted over Sisterville, West Virginia; viewed through binoculars, it matched other descriptions by being cone-shaped and having fins (or wings), and with brilliant red, green and white lights at one end.

The following day, an estimated three thousand people at Cripple Creek, Kansas, saw an unidentified object shining in the sunlight, hovering about a mile high in the sky. According to Flammonde: ‘inspection through a telescope revealed a large, slowly moving, conical object’.

More reports, some of which were obviously hoaxes, poured in over the next few days until, on 30 April, the last airship was sighted by three people in the early hours of the morning over Yonkers, New York. According to witnesses, this final airship flew over Yonkers at approximately 3am, heading north toward the sea, before being swallowed up by the darkness.

The Great Airship Scare of 1896-1897 formally came to an end with that eerie sighting.

While the reaction of a largely hostile scientific community was to dismiss the sightings as optical illusions caused by atmospheric phenomena or hoaxes, their claims hold little water in view of the actual nature of the sightings. The Great Airship Scare of 1896-97 was not one in which people reported strange 'lights', 'ghost ships' or 'flying saucers', but one in which most reports had remarkable consistency in their details and were based on lengthy, close sightings. As Paris Flmmonde points out regarding the unidentified object observed over Omaha, Nebraska, on 5 April 1897: 'A hundred of the city's most prominent citizens were prepared to testify that they had monitored more than a mere light, however brilliant and fanciful in its flight. They had seen an *airship*. Likewise, when on 10 April the same, or another, airship hovered over Chicago, it was clearly observed by many people from the top of a skyscraper in the Loop.

These sightings, therefore, were definitely of a manned, motor-driven airship of the kind still in its infancy even in Europe, but not known to have been constructed in America.

Could such a craft have been designed and built, in secret, in America by 1896?

Contrary to popular belief, it was certainly possible.

The scientific community's reluctance to accept the reality of the Great AirShip Scare was based on the fact that though airships existed in 1896, most of them were constructed and flown in Europe, not America, and even those could do little other than hover helplessly in the air or fly slowly for very short distances.

The first European airship was built in 1852 by Henry Giffard of France. Powered by a 350-pound engine, it was successfully flown over the Paris Hippodrome at a speed of six miles an hour. An internal-combustion engine fuelled by hydrogen from the airship's bag was then used by the German, Paul Haenlein, for his even more successful flight of 1872. Albert and Gaston Tissandier of France successfully powered an airship with an electric motor in 1883; and the following year, Charles Renard and A.C. Krebs made a short return flight at about thirteen miles per hour in a nonrigid dirigible powered by an electric motor. The first rigid airship, with an aluminium-sheeting hull and powered by a gasoline-fired engine, was built by David Schwartz in

Germany in 1897. The first dirigible with an internal-combustion engine was built by another two Germans, Wolfert and Baumgarten, though it exploded before its trial flight. The first truly successful nonrigid, controllable airship, using two internal-combustion engines, was designed and constructed in France by Alberto Santos-Dumont, who subsequently thrilled the whole of France by flying from St. Cloud to the Eiffel Tower and back, a distance of seven miles, in thirty minutes. Finally, in June 1900, Count von Zeppelin's first airship flew across Lake Constance; and the Germans subsequently used a number of large Zeppelin airships to bomb Paris and London throughout the Great War of 1914-1918.

(Ironically, the first *successful* dirigible, Thomas Baldwin's *California Arrow*, was constructed and flown in Oakland, California, in 1904, months after the Wright brothers made the first sustained, powered and controlled flights in history at Kitty Hawk, North Carolina, in their biplane, the *Flyer*.)

Though the European airships were the ones most widely known, it is possible that some were constructed, possibly in secret, in the United States during that same period. Certainly, though the Great Airship Scare took place five years *before* the first historic experiments of Orville Wright and his brother, Wilbur, there were, by that time, various airship designs on the drawing boards or in the Patent Office. For instance on 11 August 1896, three months before the beginning of the Great Airship Scare, patent number 565805 was given to Charles Abbot Smith of San Francisco for an airship he intended having ready by the following year. Another patent, number 580941, was issued to Henry Heintz of Elkton, South Dakota, on 20 April 1897, a few weeks before the airship flap ended. It should be noted, however, that while many of the UFOs sighted were shaped roughly like the patented designs, there is no record of those airships having been built.

Which doesn't necessarily mean that *no* airships were built.

Was the state of scientific knowledge in the United States at that time up to the task?

The short answer is 'Yes.'

It is a widely held misconception that those were early days for advanced technology, but they were in fact the most productive days in the history of science. By 1895 Rontgen had discovered X-rays, Marconi had invented wireless telegraphy, Auguste and Louis Lumiere had invented the

cinematograph, the first main railway was electrified, and Ramsay had detected, by spectroscope, helium from a terrestrial source. By 1896 we had Rutherford's magnetic detection of electrical waves, the construction of an electrical submarine in France, and the first successful flights of S.P. Langley's flying machines. By 1897 numerous patents for flying machines had been registered, and J.J. Thomson's work on cathode rays had led to the evaluation of the electron.

Regarding aeronautical knowledge in particular, American interest in the possibilities of flight was intense, a lot of research work was under way, and the experimental work of the period was certainly more advanced than is generally believed.

In 1896, perhaps the most renowned seat of aeronautical teaching was the Massachussetts Institute of Technology, more widely known as MIT. Although there were no formal aeronautical courses at MIT in the late 1800s, there were plenty of informal courses on propulsion and the behaviour of fluids - two subjects necessary to aeronautical experimentation and which rocket inventor, Robert H. Goddard, an MIT pupil, later made his own.

The first degree in aeronautics was conferred by MIT in 1892; by 1896, instructors and students there had built a wind tunnel and were experimenting with it to get practical knowledge of aerodynamics. The tunnel was a rectangular duct leading from the forced ventilating system in the basement of the old engineering building, 'Eng.A', on Trinity Place in Boston (diagonally across from the old Boston Art Museum; a site now occupied by the Sheraton Plaza Hotel) and the tests included measurements of lift and drag, airspeed determination by a vane anemometer, and the action of wind pressure on various surfaces, or wings.

The second most important seat of learning was Sibley College, Cornell University, in Ithica, New York, where by the mid-1890s it was possible to obtain a Bachelor of Sciences in Aeronautics. Courses at Sibley College included mechanical and electrical engineering, and machine design and construction. At Sibley College the experimental engineering courses were conducted by professors Rolla Clinton Carpenter, George Burton Preston, Aldred Henry Eldredge, Charles Edwin Houghton, and Oliver Shantz - some of the greatest aeronautical thinkers of their day. Also lecturing occasionally at Sibley was Octave Chanute, the world-famous engineer who wrote *Progress in Flying Machines* (1894); and, in 1896, emulated the successful

manned hang-glider experiments of the German, Otto Lilienthal, at an aerial experiment station on the Lake Michigan sand dunes near Miller, Indiana.

Specific aeronautical texts of the time were surprisingly advanced and would have included the Smithsonian Institution's *Experiments in Aerodynamics*, published in 1891; the Lawrence Hargraves experiment reports of 1890 to 1894; the 1893 reports on Sir Hiram Maxim's experiments on engines, propellers, aeroplanes and flying machines; and the *Aeronautical Annual* of 1895, 1896, and 1897, which contained original contributions from most of the leading aeronautical scientists.

Therefore, assuming that experiments with airships were being funded in secret, the knowledge and talent would certainly have been available, and airships of advanced design could have been constructed in the United States by the time of the Great Airship Scare.

As for doing so in secret, this also would have been possible, since it was a time when financiers were in fierce competition with one-another to sink money into experimental aeronautical projects - and most of those projects were wrapped in the strictest secrecy. Given this situation, a talented aeronautical engineer or inventor could have worked in almost total anonymity with the full support, even encouragement, of his financial backers. Also, the US government was known to have quietly financed more than one aeronautical project; while the US Army Air Force occasionally took over civilian aeronautical projects and either ran them in strict secrecy or, for one reason or another, quietly aborted them.

Thus it is possible that an airship of the capabilities described by thousands of witnesses during the Great Airship Scare could have been constructed in secret in the United States during that period.

But by whom?

In the mid-1890s, in the US, the general belief was that aerial navigation would be solved through an airship, rather than a heavier-than-air flying machine - so most of the earlier designs looked like dirigibles with a passenger car on the bottom. What stands out in the 1896-97 sightings is that the unidentified flying objects were mostly cigar-shaped, that they frequently landed, and that their occupants often talked to the witnesses, usually asking for water for their machines. The most intriguing of the numerous contactee stories involved a man who called himself 'Wilson'.

The first incident occurred in Beaumont, Texas, on 19 April 1897, when one J.B. Ligon, the local agent for Magnolia Brewery, and his son Charles, noticed lights in a pasture a few hundred yards away and went to investigate. They came upon four men standing beside a large, dark object which neither of the witnesses could see clearly. One of those men asked Ligon for a bucket of water. As Ligon fetched the water, the man introduced himself as 'Mr Wilson'. He then told Ligon that he and his friends were traveling in a flying machine, that they had taken a trip out to the gulf (presumably the Gulf of Galveston, though no name was given) and that they were returning to the quiet Iowa town where the airship and four others like it had been constructed. When asked, Wilson explained that electricity powered the propellers and wings of his airship - then he and his buddies got back into the airship and Ligon watched it ascending.

The next day, April 20, Sheriff H.W. Bayer of Uvalde, also in Texas, went to investigate a strange light and voices in back of his house. He encountered an airship and three men - and one of the men introduced himself as Wilson, from Goshen, New York. Wilson then enquired about one C.C. Akers, former sheriff of Zavalia County, saying he had met him in Fort Worth in 1877 and now wanted to see him again. Sheriff Baylor, surprised, replied that Captain Akers was now at Eagle Pass, and Wilson, apparently disappointed, asked to be remembered to him the next time Sheriff Baylor visited him. Baylor reported that the men from the airship wanted water and that Wilson requested that their visit be kept secret from the townspeople; then he and the other men climbed back into the airship and: 'its great wings and fans were set in motion and it sped away northward in the direction of San Angelo'. The county clerk also saw the airship as it left the area.

Two days later, in Josserand, Texas, a whirring sound awoke farmer Frank Nichols, who looked out from his window and saw brilliant lights streaming from what he described as 'a ponderous vessel of strange proportions' floating over his cornfield. Nichols went outside to investigate, but before he reached the large vessel, two men walked up to him and asked if they could have water from his well. Nichols agreed to this request - as farmers in those days mostly did - and the men then invited him to visit their airship, where he noticed that there were six or seven crew members. One of those men told him that the ship's motive power was highly condensed electricity and that it was one of five that had been constructed in a small

town in Iowa with the backing of a large stock company in New York.

The next day, on April 23, witnesses described in the Houston *Post* as two ‘responsible men’ reported that an airship had descended where they lived in Kountze, Texas, and that two of the occupants had given their names as Jackson and... Wilson.

Four days after that incident, on April 27, the Galveston *Daily News* printed a letter from the aforementioned C.C. Akers, in which he claimed that he had indeed known a man in Fort Worth, Texas, named Wilson; that Wilson was from New York; that he was in his middle twenties; and that he was of a mechanical turn of mind and was then working on aerial navigation and something that would astonish the world.

Finally, early in the evening of April 30, in Deadwood, Texas, a farmer named H.C. Lagrone heard his horses bucking as if in stampede. Going outside, he saw a bright white light circling around the fields nearby and illuminating the entire area before descending and landing in one of the fields. Walking to the landing spot, Lagrone found a crew of five men, three of whom engaged him in conversation while the others collected water in rubber bags. The men informed Lagrone that their airship was one of five that had been flying around the country recently; that theirs was in fact the same one that had landed in Beaumont a few days before; that all the airships had been constructed in an interior town in Illinois - which borders Iowa - and that they were reluctant to say anything else because they hadn’t yet taken out any patents. By May that same year, the wave of sightings ended - and the mysterious Mr Wilson wasn’t heard from again.

While I have used the mysterious ‘Wilson’ as a major protagonist in my five *Projekt Saucer* novels, creating what I believe is a plausible explanation for him, it has to be conceded that no proof for his existence, other than that mentioned above, has ever surfaced and he has not been heard from since the end of the Great Airship Scare in 1897. Nevertheless, even given that the letter from C.C. Akers printed in the Galveston *Daily News* on 27 April 27 1897 could have come from a hoaxer after he had read the original story about Akers’ friendship with Wilson, we are still left with a surprising consistency in the various reports, as well as in the recollection of the name ‘Wilson’ from witnesses in widely scattered areas who would not have had access to news stories from other states.

That Wilson existed as ‘Wilson’ or was someone else using a

pseudonym is a matter of relative unimportance. The major question raised by the 'Wilson' mystery is whether or not a person, or persons, constructed an advanced airship, or airships, in secret and flew it, or them, across the United States from November 1896 to May the following year.

UFO historian Lionel Beer is of the opinion that a manned airship was responsible for the Great Airship Scare. Beer also points out that Dr Geoffrey Doel, former president of The British Unidentified Flying Object Research Association (BUFORA), had made a convincing case for this, suggesting that the man responsible was Edward Joel Pennington, of Racine, Wisconsin.

In 1890 Pennington started a company called The Mount Carmel Aerial Navigation Company and filed patents for a four-cylinder radial engine for the propulsion of an aerial vessel. In 1891 he exhibited a thirty-foot airship powered through its tethering cable by an electrically turned airscrew; and by 1895, after announcing that he intended to open an airship passenger service between Chicago and New York, he deposited patents with the American Patents Office for a full-sized airship.

Regarding this, it is worth noting that the average length of the craft sighted during the Great Airship Scare of 1896-97 was thirty feet and that many were reported as having 'cables' and electrically powered airscrews.

According to Lionel Beer, the two photographs of the mystery airship taken by Walter McCann in 1897 showed a 'distant object' closely resembling Pennington's design. In *The UFO Controversy in America* David Michael Jacobs says that it 'remarkably resembled' the mystery airships sighted by so many in 1896 and 1897, and had 'a cigar-shaped gas bag with wings attached to the sides, a large railroad-like car hanging from the bottom of the bag, and storage batteries to light the car'.

On 15 April 1897, shortly after newspapers reported that an airship had crashed, farmers Jeremiah Collier and William York claimed that they had come across a grounded airship on Wood Patch Hill, Brown County, Indiana. According to these gentlemen, the craft had been damaged and the crew, who were carrying out repairs, claimed that it belonged to E.J. Pennington. When interviewed about this on April 19, Pennington admitted that the damaged airship was his, that reports about the machine blowing up (New York *Herald*, 14 April 1897) had been exaggerations, and that 'owing to the roof of our machine springing a leak, one of our electrical circuits became grounded and the dynamo burned out'. He also claimed that he had three

machines in the air, presently over the central states, and that while one would be turning up at the Tennessee exposition, he would be flying another to Cuba, to 'join the patriots in their struggle for liberty'.

While no motor-powered airship materialized at the Tennessee exposition of May that year, a bicycle-powered airship was demonstrated, flying successfully for short distances. (As far as the history books are concerned, the first motor-driven airship was built and flown in the United States in 1900 by A. Leo Stevens.) As for Pennington's reference to Cuba (which echoes the remarks of W.H.H. Hart), on the evening of April 14, in Springfield, Illinois, farmworker John Halley and another resident, Adolf Wenke, witnessed the descent of an airship on a field just outside town and were informed by the pilot, before the airship took off again, that his craft would be 'used in Cuba' as soon as 'Congress recognized Cuban belligerency'.

Pennington neither flew his airship to Cuba nor opened his planned airship passenger service; and as far as can be ascertained, he stopped constructing airships and dropped out of sight shortly after the Great Airship Scare ended. While David Michael Jacobs states that this was because Pennington 'could not raise the necessary funds to actually build the ship', Beer says that 'it is not known for sure' why he failed to complete his project and suggests that he was possibly 'shrewd enough to realize that aeronautical designers in France and Germany were well ahead of him and that the Zeppelins would not be long in coming'.

Nevertheless, the fact remains that during the Great Airship Scare thousands of people across the United States saw what was clearly a manned, motor-driven airship. The true identity of the genius who built it may never be known.

Chapter 3

-

Technology and Sightings of World War II

Before writing the *Genesis* book in the *Projekt Saucer* series, while researching a World War Two novel, I obtained through the Imperial War Museum, London, two short articles which attracted my attention. One was a routine war report by Marshall Yarrow, then the Reuters special correspondent to Supreme Headquarters in liberated Paris. The particular cutting I had was from the *South Wales Argus* of 13 December 1944 and it stated: 'The Germans have produced a "secret" weapon in keeping with the Christmas season. The new device, which is apparently an air defence weapon, resembles the glass balls which adorn Christmas trees. They have been seen hanging in the air over German territory, sometimes singly, sometimes in clusters. They are coloured silver and are apparently transparent. The second article, an Associated Press release published in the New York *Herald Tribune* of 2 January 1945, illuminated the subject even more. It said:

> Now, it seems, the Nazis have thrown something new into the night skies over Germany. It is the weird, mysterious 'Foo fighter' balls which race alongside the wings of Beaufighters flying intruder missions over Germany. Pilots have been encountering this eerie weapon for more than a month in their night flights. No-one apparently knows what this sky weapon is. The 'balls of fire' appear suddenly and accompany the planes for miles. They seem to be radio-controlled from the ground, so official intelligence reports reveal.

Either because of the famous line from the popular Smokey Stover comic strip, 'Where there's foo, there's fire', or simply because the French word for 'fire' is *feu*, these 'eerie' weapons soon became widely known as 'foo fighters'.

Official 'foo fighter' reports were submitted by pilots Henry Giblin and

Walter Cleary, who stated that on the night of 27 September 1944 they had been harassed in the vicinity of Speyer by ‘an enormous burning light’ that was flying above their aircraft at about 250 mph; then by Lieutenant Edward Schluter, a fighter-pilot of the US 415th Night-Fighter Squadron based at Dijon, France, who, on the night of 23 November 1944, was harassed over the Rhine by ‘ten small reddish balls of fire’ flying in formation at immense speed. Further sightings were made by members of the same squadron on 27 November, 22 December and 24 December.

In a report published in the New York *Times* of 2 January 1945, US Air Force Lieutenant, Donald Meiers, claimed that there were three kinds of foo fighter: red balls of fire that appeared off the aircraft’s wingtips, other balls of fire that flew in front of them, and ‘lights which appear off in the distance - like a Christmas tree in the air - and flicker on and off’. Meiers also confirmed that the foo fighters climbed, descended or turned when the aircraft did so. The foo fighters were witnessed both at night and by day, yet even when pacing the Allied aircraft they did not show up on the radar screens.

A classified project had actually been established in England in 1943 under the direction of Lieutenant General Massey, to examine a spate of reports of unidentified flying objects submitted by British, French and American pilots flying bombing missions over occupied France and Nazi Germany. While no official designation of the foo fighters was offered, most reports indicated that they were ‘balls of fire’ that flew in parallel formation with the Allied aircraft, often pacing them for great distances, at speeds exceeding 300 mph, frequently causing their engines to malfunction by cutting in and out. While a few reports of crashing Allied aircraft suggest that foo fighters caused the crashes by making the aircraft’s engines cut out completely, most reports indicate that this was unlikely and that the foo fighters merely tailed the planes and caused psychological harm, rather than physical damage. They also flew away when fired upon.

At first it was assumed that the ‘balls of fire’ were static electricity charges, but the mounting body of evidence made it clear that they were under some kind of control and were certainly not natural phenomena. Indeed, according to a London *Daily Telegraph* report of 2 January 1945, RAF pilots were describing them as ‘strange orange lights which follow their planes, sometimes flying in formation with them, and eventually *peeling off*

and climbing (author's emphasis)'. This soon led to speculation that they were German secret weapons, radio-controlled from the ground, and designed either to foul the ignition systems of the bombers or act as 'psychological' weapons that confused and unnerved the Allied pilots. Finally, unable to solve the mystery, both the RAF and the US Eighth Army Air Force concluded that they were the products of 'mass hallucination' and subsequently did no more about them.

Sightings of the foo fighters tailed off and ceased completely a few weeks before the end of the war.

The next wave of UFO sightings occurred in Western Europe and Scandinavia, where from 1946 to 1947 many people, including airline pilots and radar operatives, reported seeing strange cigar- or disk-shaped objects in the skies. On 21 June 1947, Harold Dahl reported seeing saucer-shaped objects flying toward the Canadian border. Three days later, Kenneth Arnold made his more famous sightings of saucer-shaped objects over the Cascades, also heading for the Canadian border.

These and subsequent sightings led to speculation that both the Soviets and the Americans, utilizing the men and material captured in the secret research plants of Nazi Germany, including those at Peenemünde and Nordhausen, were developing advanced saucer-shaped aircraft.

In the words of Captain Edward J. Ruppelt, then head of the US Air Force's Project Blue Book: 'When World War II ended, the Germans had several radical types of new aircraft and guided missiles under development. The majority of these projects were in the most preliminary stages, but they were the only known craft that could even approach the performance of the objects reported by UFO observers.'

Were such speculations based on facts?

It would certainly seem so.

The late 1800s and early 1900s produced some of the greatest advances in the history of aviation. The first successful flights of S.P. Langley's flying machines were made in 1896 - the first year of the Great Airship Scare - and by 1900 numerous patents for airships had been registered. In 1900 Count von Zeppelin's dirigible balloon, powered by an internal combustion engine and propellers, became the first real directed flight by man; and by 1901, in Paris, France, Santos Dumont had flown an airship from S. Cloud to the

Eiffel Tower and back in under thirty minutes to win the French Aero Club prize; two years later, at Kitty Hawk, North Carolina, the Wright Brothers made the first successful heavier-than-air manned flight; on the last day of December 1908, Wilbur Smith flew 77 miles in two hours and thirty minutes; seven months later, the French aviator, Louis Blériot, flew across the English channel, from Calais to Dover; and throughout the Great War of 1914-18 the Germans successfully used advanced Zeppelin airships to bomb London and Paris.

However, while these great aeronautical achievements were enthralling the world, even more radical theories and experiments were taking place quietly elsewhere. In 1895, a year before the Great Airship Scare, the renowned Russian physicist, Konstantin Tsiolkovsky, was theorizing about the possibilities of space flight in his essays. By 1898 he had understood and written about the necessity for liquid-fuelled rocket engines. His later reputation as the 'father' of space flight rests on a series of articles he wrote on the theory of rocketry, and by the 1920s he was suggesting some of the devices that the American rocket genius, Robert H. Goddard, was to develop so brilliantly.

Goddard was always well ahead of his time. Born in Worcester, Massachusetts, in 1882, he graduated from the Worcester Polytechnic in 1908, received his Ph.D. in physics at Clark University in Worcester in 1911, taught at Princetown, but returned to Clark in 1914, the same year in which he obtained his first two patents for rocket apparatus. Five years later, he published his book, *A Method of Reaching Extreme Altitudes* (1919), and by 1923 he was already testing the first of his rocket engines using gasoline and liquid oxygen - the first advance over solid-fuel rockets. In 1926 he sent his first rocket soaring successfully skyward, and a larger one, financed by the Smithsonian Institution, went up three years later as the first instrument-carrying rocket. In 1930, with further help from the Smithsonian Institution, the philanthropist Daniel Guggenheim and famed aviator Charles Lindbergh, he set up an experimental station in a desolate area near Roswell, New Mexico, where he built larger rockets and introduced many of the ideas that are now standard in rocketry, including appropriate combustion chambers, the burning of gasoline with oxygen in such a way that the rapid combustion could be used to cool the chamber walls, various revolutionary rocket steering systems, including rudder-like deflectors and gyroscopes, and the

basics for the first multistage rocket. From 1930 to 1935, in the seclusion of his testing grounds near Roswell, New Mexico, Goddard launched rockets that attained speeds of up to 350 mph and heights of a mile and a half.

Even more remarkable than Goddard's achievements was the fact that they were, at least until the advent of World War II, ignored by the United States Government - though certainly they were not ignored in Germany.

The German amateur rocket society, the *Verein für Raumschiffart*, or VfR, also known as the Spaceship Travel Club, had come into being in 1927 when a group of brilliant space-travel enthusiasts took over an abandoned three-hundred acre arsenal, which they called their *Raketenflugplataz*, or Rocket Flight Place, in the Berlin suburb of Reindickerdorf. From there they actually shot some crude, liquid-fuelled rockets skywards.

By 1930 the VfR included most of the rocket experts of the day, including Rudolf Nebel, Hermann Oberth, Willy Ley, Max Valier, Klaus Riedel and the then 18-year old Werner von Braun, who would end up in America, heading the moon program for the National Aeronautics and Space Administration (NASA).

In April 1930, the Ordnance Branch of the German Army's Ballistics and Weapons Office, headed by General Becker, appointed Captain Walter Dornberger to work on rocket development at the army's Kummersdorf firing range, approximately fifteen miles south of Berlin. Two years later, after many experiments to find the most promising method of propulsion and the most stable means of flight, the VfR demonstrated one of their liquid-fuelled rockets to Dornberger and other officers at Kummersdorf. In 1933, when Hitler came to power, the VfR was taken over by the Nazis and become part of the Kummersdorf program.

Many of the German engineers, including the up-and-coming Werner von Braun, revered Goddard and were known to have based their work on his ideas. While in the United States, Goddard's theories were still being received with indifference and even contempt, Hitler's Germany was spending fortunes on rocket research that was, by and large, based on Goddard's work.

As early as December 1934, two highly advanced A-2 rockets, constructed at Kummersdorf, gyroscopically controlled, and powered by oxygen-and-alcohol fuelled motors, were launched from the island of Borkum in the North Sea and reached an altitude of one-and-a-half miles.

Those stabilised, liquid-fuelled rockets were, at the time, the only known, serious challengers to the rockets of Robert H. Goddard.

Nor did it end there. Shortly after Hitler's infamous advance across the Hohenzollern Bridge on 7 March 1936, Captain Walter Dornberger, the head of the Rocket Research Institute, his assistant, Werner von Braun, and their team of 150 technicians, demonstrated some more motors at Kummersdorf, including one with an unprecedented 3,500 pounds of thrust. Those demonstrations so impressed the German Commander-in-Chief, General Fritsch, that permission was given for Dornberger and von Braun to build an independent rocket establishment in a suitably remote part of Germany, where research and test firings could be carried out in the strictest secrecy. The chosen site was near the village of Peenemünde, on the island of Usedom, off the Baltic Coast.

The rest is now history. After numerous experiments in the Zeppelin subsonic wind tunnel at Friedrichshafen and the University of Aachen's supersonic wind tunnel, and with the completion of a remarkably reliable gyroscopic control system by the electrical specialists, Siemens, radio-controlled A-5 rockets were soon being dropped from heights of up to 20,000 ft and speeds exceeding Mach 1, or the speed of sound. By late 1944, numerous V-1 and V-2 rockets were falling on London.

What is not so well known is that when the V-2 rockets were inspected by Allied scientists in the captured Nordhausen Central Works at the close of the war, it was discovered that the most notable features of the propulsion unit were the shutter-type valves in the fixed grill, the fuel injection orifices incorporated in the same grill, the combustion chamber, spark plugs and nozzle - all of which were to be found in a Robert H. Goddard patent, issued 13 November 1934 and reproduced in full in the German aviation magazine, *Flugsport*, in January 1939.

There were other striking similarities between the V-2 and Goddard's original rocket. Both rockets had the same motor-cooling system; the same pump drive; the same layout front to rear; the same stabilizer; and the same guidance and fuel injection systems. Indeed the only notable difference between the two was that Goddard's rocket motors used gasoline and oxygen, whereas the V-2 used hydrogen and peroxide; Goddard's rocket fuel was liquid oxygen and gasoline, whereas the V-2 used liquid oxygen and alcohol; and, finally, Goddard's original rocket was a lot *smaller* than the V-2.

The V-2 rockets had a thrust of 55,000 pounds, attained a velocity of 6,400 ft per second, and could soar to an altitude of 68 miles. What this meant, in effect, is that the Germans had taken designs shamefully neglected by the American Government and used them as the basis for a radical, highly advanced, supersonic technology. They had also learned through Goddard of the necessity for gyroscopic control and thus potential control of the boundary layer.

What is the boundary layer?

While being four or five thousand times less viscous than oil, air *is* still viscous. Because of this, the air sweeping in on the solid body of an aircraft forms imperceptible stratifications of resistance and consequently decreases the speed of the body in flight. These layers of air are therefore known as the 'boundary layer' - and the boundary layer increases its resistance in direct proportion to the increasing speed of the flying object, thus imposing severe limitations on its speed and manoeuvrability.

Though the boundary layer affects all forms of flight, the major problem regarding ultra-high speed flight is to somehow move this negative air as far to the rear of the aircraft as possible, thus minimizing the expenditure of energy required to propel the aircraft through the sky. Moreover, it is possible that a revolutionary type of aircraft could - by not only *completely* removing the boundary layer, but by somehow *re-routing* it and utilizing it as an added propulsive force - fly through the skies using little other than the expelled air itself. Should this be accomplished, we would have an aircraft capable of remarkable speeds while using only the bare minimum of conventional fuel.

The Germans were working on all aspects of the boundary layer even before the beginning of the Great War of 1914-18.

Physicist Dr Eduard Ludwig worked with the famous aircraft designer Hugo Junkers at his factory in Dessau where, in 1910, they produced one of the earliest 'flying wing' designs. According to Ludwig, the first physicist to consider 'this new branch of aerodynamics' was Professor Jubowski, of Moscow. Before the First World War, Jubowski worked with Dr Kutta, of the Technical High School of Stuttgart, Germany, on the development of the theory of aeroplane-wingbeam and succeeded in establishing the differential equation of the boundary layer, which for the first time threw light on why 'a plane-wing can bear a load while moving forward through the air'. Since then, according to Ludwig, the Kutte-Jabowski Theory of Aeroplane

wingbeam has been the foundation of all aerodynamics.

However, even earlier than that, in 1904, at the Aerodynamic Experimental Institute of the Göttengen University, Professor Ludwig Prandtl, the great physicist now known as 'the father of aerodynamics', discovered the boundary layer, which in turn led to the understanding of the way in which 'streamlining' would reduce the drag of aeroplane wings and other moving bodies. Prandtl's work soon became the basic material of aerodynamics, and he went on to make pioneering discoveries in subsonic airflow, advanced wind tunnel design, and other aerodynamic equipment design. He also devised a 'soap film analogy' for the analysis of torsion forces of structures, and produced invaluable studies on the 'theory of plasticity'.

By 1915, another member of the Technical High School of Stuttgart, Professor H.C. Bauman, utilizing the theories of the abovenamed, received a patent for a Splitwing 'through which the artificial interruption of the course of the current, the tearing of the boundary layer, and the consequent braking and diminishing of the landing speed would be attained'.

Meanwhile, Anton Flettner, the German director of an aeronautical and hydrodynamic research institute in Amersdam, had invented the rotor-ship, a vessel propelled by revolving cylinders mounted vertically on the deck. In 1926 he established an aircraft factory in Berlin, where he used what became known as the 'Flettner-Rotor' for the production of Flettner F1 282 and other helicopters. Soon, at the behest of Professor Junkers, the Flettner-Rotor ('a cylinder turning at great speed') was being utilized by professors Prandtl, Ludwig, and others, as a means of investigating 'to what extent the uplift of a wing could be increased'.

The experiments were fraught with difficulty and cost the lives of at least four test pilots. This was due to 'inexplicable vibrations and axle breakages', leading the scientists to the conclusion that 'only a gas-turbine could produce the required uplift of the cylinder'. This led in turn to the building of a wind tunnel in which many invaluable experiments on the relationship between supersonic speeds and the boundary-layer were conducted, culminating in the first successful flight of a jet aircraft in 1939, as well as the launching of the V-1 and V-2 rockets during the closing stages of World War II.

The German scientists and engineers believed that the perfect flying machine would be one that required no runway, since it would take off vertically,

would be able to hover in mid-air, and would not be limited in manoeuvrability or speed by the boundary layer. As the build-up of the boundary layer is dramatically increased by the many surface protuberances of a normal aircraft - wings, tails, rudders, rotors, cockpits - it was felt that by getting rid of them completely, by somehow wrapping them together as part and parcel of the one, circular, smooth-surfaced flying wing, the first step in the conquest of the boundary layer would be achieved.

Germany was the country with most interest in such developments and certainly the most advanced at that time. A disk or saucer-shaped aircraft, without any surface protuberances, powered by ultra-high speed engines, is what they were after and many designs of the time were based on that conception. It is therefore no accident that as early as 1935 a German, Hans von Ohain, had applied for a patent for a jet engine. Nor was it an accident that the first flight of a jet-powered aircraft was made by a Heinkel He 178 at Rostock, Germany, on 27 August 1939.

Regarding vertical-rising aircraft, the Focke-Achgelis Company had already announced in 1939 that it had almost completed its FW 61 helicopter, which would be the first fully operational helicopter in existence. That the Germans produced the first successful helicopter, yet were not known to have used such craft during World War II, may be due to the fact that already they were more concerned with tailless aircraft or ‘flying wings’, devoid of vertical stabilizing or control surfaces. This would lead them to the search for a jet-propelled, disk-shaped aircraft, or flying saucer.

By 1932 the Horten brothers of Bonn had produced some successful prototypes for the German Air Ministry at their factory in Bonn. The Horten 1 was an ‘all wing’ aircraft, which in prototype form was a wooden-framed glider. It had a span of 40.7 feet, a wing area of 226 square feet, and a wing-loading of 2 pounds per square foot. It had a flying weight of 440 pounds, a gliding angle of 21 degrees, and a flying life of approximately seven hours. As the Horten brothers were convinced that the most important form of aircraft would be the all-wing type, there were no vertical stabilizing or control surfaces on the Horten 1. It was virtually flat and crescent-shaped, like a boomerang, with the pilot placed in a prone position, to reduce cockpit size. This so-called ‘flying wing’ certainly flew for seven hours, but it could never have been the basis of a flying saucer for one very good reason: it was still faced with the problem that had repeatedly foiled other German

aeronautical engineers - the limitations imposed by the boundary layer.

A more advanced model, the Horten II, D-11-167, was built in 1934 and test-flown at Rangsdorf, Germany, on 17 November 1938. According to the report of Hanna Rasche (the popular female pilot who also demonstrated the Focke-Achgelis helicopter the same year), this test flight turned out to be highly unsatisfactory. The so-called tailless aircraft possessed great static-longitudinal stability and complete safety in relation to the spin, but its control surfaces were so heavy that measurements of manoeuvring stability could not be carried out. The unsatisfactory arrangement of its undercarriage necessitated too long a takeoff; the relation between its longitudinal, lateral and directional controls was unsatisfactory; its turning flight and manoeuvrability were fraught with difficulty, and side-slipping could not be carried out.

Nevertheless, the Horten designs were the first on the road to a disk-shaped aircraft and, as we shall see, would cause great concern amongst Allied scientists and intelligence officers involved in post-war investigations into the possibility of German, or German-based, Russian flying saucers.

While experiments with ‘flying wings’ and spherical aircraft were being conducted by the likes of the Horten brothers, many other German scientists, including Betz, Flettner, and Junkers, were experimenting with specially equipped airwings in attempts to reduce the boundary layer. Most of these experiments were based on the ‘suction’ method, in which the negative air is sucked into the wing itself, through tiny holes or slots, then expelled by means of a pump located in the fuselage.

While this was a step in the right direction, the resulting aircraft still required heavy, obstructive engines (also the main problem with the Horten brothers’ envisaged flying wing jet-fighter), but the belief remained that in order to get rid of the boundary layer completely - and in order to make use of the ‘dead’ air not only for acceleration, but for manoeuvring as well - the requirement was for an aircraft devoid of *all* obstructing protuberances, such as wings, rudders and even normal air-intakes, and one not requiring a large, heavy engine. In other words, this revolutionary new aircraft should be the perfect ‘flying wing’ that offers the least possible resistance, sucks in the ‘dead’ air of the boundary layer, and then uses that same air, expelling it at great force, to increase its own momentum. It would therefore have to be a

circular ‘wing’ that is, in a sense, wrapped around its suction pump, with the pump being part and parcel of the engine: a machine shaped like a saucer.

Further: if such a craft could be built with a ‘porous’ metal that would act like a sponge and remove the need for air-intakes altogether, it would result in ‘frictionless air-flow’ during flight.

Speaking at the 34th Wilbur Wright Memorial Lecture held on 30 May 1946, at the Royal Aeronautical Society in London, the well known British aerodynamics expert Professor E. F. Relf stated that ‘a further system of regulating the boundary layer by means of suction through minute holes heavily distributed over the surface’ had recently been undertaken by the National Physical Laboratory. Discussing similar possibilities at a conference held in December the same year on the future of British aeronautics, Sir Ben Lockspeiser said that such a plane would ‘slip through the air in the same way as a piece of wet soap slips through the fingers’.

The speed and manoeuvring capabilities of such a craft would be virtually limitless.

While the idea of ‘porous’ metal sounds like something from science fiction, it was in fact being developed in Nazi Germany, as well as in Britain. Among the many other advanced experiments being run in the wind tunnel in the Zeppelin works at Friedrichshafen were those concerning the different ‘porous’ metals, or ‘aeropermeable surfaces’, that were being created by the scientists of Göttingen, Aachen, and Volkenrode - various compounds of magnesium and aluminium, sinterized and permeated with microscopic holes. It was called *Luftschwamm*, or ‘aero-sponge’.

Other top-secret experiments relating to supersonic flight were taking place all over Nazi Germany and its captured territories.

In the densely forested areas of the Schwarzwald, German scientists were experimenting with a liquid gas that would, when blown with considerable force over an aircraft, catch fire from the aircraft’s exhaust and cause that aircraft to explode. The existence of this gas was confirmed by a German organic chemist, Dr Rosenstein, who, when interrogated in Paris in 1944 by members of the American ALSOS mission (created to locate and assess the fruits of Nazi Germany’s scientific research), stated that the Germans had succeeded in perfecting a new gas whose use would have caused ‘strong vibrations and even breakages in aircraft engines’ by encouraging immediate

and repeated self-ignition. The captured papers also revealed that in July 1944, Dr Hans Friedrich Gold, a chemical engineer working in the rocket division of the R-Laboratory in Volkenrode, discovered that by mixing a certain percentage of myrol with air, internal combustion engines would immediately begin detonating irregularly or, depending upon the mixture, stop completely.

Further to this, it should be noted that according to Major Rudolph Lusar's *German Secret Weapons of World War II*, in April 1945, on the outskirts of the Hillersleben testing grounds west of Berlin, members of the Intelligence Technical Branch of the 12th Army Group found the rusty remains of an odd item called the *Windkanone* - a cannon that shot gas instead of shells - and another item called the *Wirbelringkanone*, or 'whirlwind annular vortex cannon', which was designed to shoot, then ignite, a gas ring that would spin rapidly on its own axis and form a fierce 'ball of fire'.

By 1945 the Oberbayerische Forschunsanstalt, or O.B.F., a Luftwaffe experimental centre at Oberammergau, in Bavaria, had completed its research into an apparatus capable of short-circuiting the ignition system of another aircraft engine from a distance of about one hundred feet by producing an intense electrical field.

Even remote-controlled flying devices were being developed. As far back as 1939 Dr Fernseh of Berlin, in collaboration with Professor Herbert Wagner of the Henschel-Rax Works at Wiener Neustadt, was working on the development of a television component that would enable pilots to control bombs and rocket bombs *after* they had been launched, as well as a micro-television camera that would be installed in the nose of an anti-aircraft rocket and guide it precisely to its target. As the Allies also discovered at the end of the war, through the investigations of ASLOS, the British Intelligence Objectives Sub-Committee, and other scientific intelligence groups, the German scientists had been developing radio-controlled interceptor weapons and aeroplanes, such as Messerschmitt's radio-controlled interceptor planes, the *Krache* and the *Donner*, as well as electromagnetic, electroacoustical and photoelectric fuses and even more advanced warheads which were sensitive to the natural electrostatic fields that surround aircraft in flight.

Also found in the records of the experimental centre at Göttingen were details of the test-flight of a light-winged aircraft that had a slot running

along the entire length of its wing span and an extra propeller in the fuselage to suck in the boundary layer and increase the lift of the original airfoil by eight times.

Last but not least, a research complex at Berlin Britz had designed the *Kreiselgerät*: the prototype of a new mechanism that had managed to reduce the oscillations of a violently shaking body to under one-tenth of a degree, thus paving the way for the conquest of the boundary layer.

The theoretical work of the German scientists, particularly those at Göttingen and Aachen, was put to practical application at the laboratories of the Deutsche Versuchsanstalt für Luftfahrt (DVL) at Adlershof and the rocket research station at Peenemünde. In this context it is worth noting that according to Philip Henshall in *Hitler's Rocket Sites*, the wind tunnel at Peenemünde was then the most advanced in the world, containing its own research department, instrumentation laboratory, workshops and design office. It is also of considerable interest that at Guidonia, the great research centre near Rome, Italy, the Germans were conducting extensive research in supersonic aerodynamics.

It therefore seems possible that the results of the oscillation tests in Göttengen, which had proved that the boundary layer could be conquered, combined with the practical applications at Adlershof, Peenemünde and Guidonia, could have produced between them a revolutionary new structural design that would be devoid of all obstructing protuberances, such as wings and rudders, devoid even of the normal air intakes, and powered by a highly advanced turbine or jet engine. In other words, a technologically advanced, tailless aircraft, or 'flying wing', that could be radio-controlled from the moment of take-off, then automatically track enemy aircraft and make their engines malfunction without firing upon them or otherwise touching them.

In essence, a small flying saucer with 'invisible' weapons.

Renato Vesco was an aircraft engineer specialising in aerospace and ramjet developments. Educated before World War II at the University of Rome, he then studied aeronautical engineering at the German Institute for Aerial Development. During the war, he was sent to work with the Germans at Fiat's immense underground installations at Lake Garda, near Limone in northern Italy, where he helped in the production of aeronautical devices that were tested at the Hermann Goering Institute of Riva del Garda. After the

war, in the 1960's, Vesco worked for the Italian Air Ministry of Defense as an undercover technical agent, investigating the UFO phenomenon.

In 1971 Vesco published a book, *Intercettateli Senza Sparare*, which was the first detailed examination of the possible technology behind the flying saucers. Vesco's work was also the first to examine UFOs in the light of contemporary technology, as well as the only one to trace their origins back to Nazi Germany and credit their continuance to postwar developments by the former Allies and, possibly, the Soviet Union.

According to Vesco, captured German papers indicated that by 1945 the L.F.A. at Volkenrode and the Guidonia research centre were working on a revolutionary new type of aircraft that was devoid of all surface protuberances, such as wings and rudders, devoid even of normal air intakes, and powered by a highly advanced turbine engine. This was the so-called foo fighter - actually the German *Feuerball*, or Fireball, which had evolved from the research work done at Volkenrode and Guidonia, but was constructed at an aeronautical establishment at Wiener Neustadt (probably the Henschel-Rax Works) with the help of the Flugfunk Forschungsanstalt of Oberpfaffenhoffen (F.F.O.), located south of Munich and specialising in research into high frequency guided missiles, infrared radiation, radar, and general electronics. The *Feuerball* was an armoured, disk-shaped, flying machine, powered by a special turbojet engine. It was radio-controlled at the moment of take-off, but then, attracted by the enemy aircraft's exhaust fumes, it automatically followed that aircraft, automatically avoided colliding with it, and automatically short-circuited the aircraft's radar and ignition systems. During the day, this device looked exactly like 'a shining disk spinning on its axis' - which may account for the first Allied newspaper reports of 'silver balls' observed in the sky over Nazi Germany - and by night it looked like a 'burning globe'.

In Vesco's words:

> The fiery halo around its perimeter - caused by a very rich fuel mixture - and the chemical additives that interrupted the flow of electricity by over-ionizing the atmosphere in the vicinity of the plane, generally around the wing tips or tail surfaces, subjected the H2S radar on the plane to the action of powerful electrostatic fields and electromagnetic influences.

Under the armoured plating of the *Feuerball* was a thin sheet of aluminium that acted as a defensive 'switch': a bullet piercing the armoured plating would automatically establish contact with the switch, trip a maximum acceleration device, and cause the *Feuerball* to fly vertically out of range of further enemy gunfire.

In a very real sense, then, the *Feuerball* took the form of a circular 'wing' that was wrapped around the suction pump, which in turn was part and parcel of the engine. In other words: the *Feuerball* was a symmetrical disk devoid of all surface protuberances.

Vesco also claims that the basic principles of the *Feuerball* were later applied to a much larger 'symmetrical circular aircraft', the *Kugelblitz*, or Ball Lightning Fighter, which was the first example of the vertical-rising, 'jet lift' aircraft.

Could the technology described above and demonstrated in the shape of the V-2 rockets and foo fighters have led to a larger, piloted, flying saucer? The immediate post-war years would produce some startling revelations regarding this possibility.

Chapter 4

-

Division of the Scientific Spoils of War

At the end of World War II, Germany's scientific papers had been hidden, and were eventually found, in tunnels, caves, dry wells, ploughed fields, river beds and even cess pits. Also found across the length and breadth of Nazi Germany and its occupied territories were the well known V-1 flying bombs and V-2 rockets, as well as lesser known, but equally formidable, heat-guided ground-to-air missiles, sonic-guidance torpedoes, the highly advanced U-XX1 and U-XXIII electrical submarines, ME-262 jet-fighters, rocket planes that flew even faster than the Messerschmitts, the prototypes for other, vertical-rising jet aircraft, the beginnings of an Atom Bomb project, and even, in the immense underground Riva del Garda complex, where Renato Vesco had worked, the manufacturing process for a metallic material which could withstand temperatures of about 1000°C.

Because of this, there was a race between the Allies and the Russians to capture as many of the rocket scientists and engineers as possible, as well as the invaluable technical documentation. Deals were thus struck between the conquerors and their former enemies, particularly with regard to those involved in rocketry and other advanced weaponry.

Along with 150 of their best men, General Dornberger, Walther Riedel, and Werner von Braun went to the United States, the first to work for the Bell Aircraft Company, the second to become director of rocket engine research for North American Aviation Corporation, and the third to achieve fame through his Apollo moon program under the auspices of the National Space Administration for Astronautics, or NASA. However, the Russians also gained a wealth of documentation and material, including the V-2 rockets, buzz bombs, ocean-spanning surface-to-surface and surface-to air missiles found in Peenemünde; about 70 per cent of the 12,000 tons of technical equipment stranded on the docks at Lübeck and Magdeburg; and the Gotha plant (where the Horten Brothers' Go-8-229 and Go-P-60 night fighters were being constructed at great speed); as well as 6,000 German technical specialists, including Dr Bock, Director of the German Institute of Airways Research; Dr Helmut Gröttrup, the electronics and guided-missile expert; and

an aeronautical engineer, Klaus Habermohl.

It was therefore no accident that the great achievements of NASA and their Soviet equivalents can be traced back to the V-2s shipped from Germany to New Mexico in 1945. The launch of American V-2s commenced at the White Sands Proving Ground in March the following year, under the direction of Werner von Braun; and not much later, when North American Aviation started producing rocket motors under a USAF contract, they were basing their work on the original V-2 motor which had, ironically, been based on the rocket motors of Robert H. Goddard when he worked out of Eden Valley, in Roswell, New Mexico, now the location of the above mentioned top-secret White Sands Proving Ground. Soon, NASA's improved rocket motors were using liquid hypergolic, self-igniting fuels, which the army then used in their Redstone/Jupiter developments, which led in turn to the first Titan ICBMs and, ultimately, the Apollo moon program.

All of this sprang indirectly from the US's neglected Robert H. Goddard; and, more directly, from the fruits of German World War II experimentation.

It was a matter of course, then, that when on 31 October 1947 the Russians launched their own V-2 rocket from Volgagrad, formerly Stalingrad, the United States had great cause for concern and, when it came to the first post-war UFO sightings, turned its suspicious gaze toward the Soviet Union.

The first post-war UFO flap came in 1946 when, throughout the summer and fall, thousands of 'ghost rockets' appeared in the skies over Scandinavia and western Europe. Mostly seen at night, they were reported as being 'cigar-shaped' and with flames issuing from the tail. Estimates of their speed ranged from that of a 'slow aeroplane' to 500 mph. In the month of July alone, the Swedish military received more than 600 reports, which encouraged the Swedish general staff to declare the situation 'extremely serious'. Then, when sightings of the unidentifieds spread out from Sweden to Finland and close to the Soviet border, the Americans also took the phenomenon seriously - certainly enough to express their fear that the rockets might be secret weapons developed by the Russians with the help of the captured German technical specialists and material.

Their fears were in no way eased by the knowledge that whereas the mysterious foo fighters had not shown up on radar, the ghost rockets certainly

did, and therefore could not be classified as hoaxes, misidentifications or the products of mass hallucination.

The Soviets denied any knowledge of the rockets, but US suspicions remained unabated while the rockets continued to fly and were being reported from as far afield as Greece, Turkey, French Morocco and Spain, before gradually fading away the following year.

However, on 21 June 1947, when the 'ghost rocket' furore had barely died off, a harbour patrolman, Harold Dahl, accompanied by his fifteen-year old son and two crewmen, was on harbour patrol near Maury Island in Puget Sound, off Tacoma, Washington, when he observed six objects shaped like 'inflated inner tubes' hovering about 2,000 feet above his boat. Five of the objects were circling about the sixth as it descended to about 500 feet above the boat, where, appearing to hover magically, it was seen more clearly. The object appeared to be about 100 feet in diameter, metallic, with no jets, rockets, wings, or propellers, but with a 'hole' in the centre, or base, symmetrically placed portholes around the perimeter, and observatory windows on their underside. After discharging what appeared to be a cloud of aluminium-coloured debris, which littered the sea, where they gave off clouds of steam, suggesting that they were hot, the circular craft ascended to rejoin the others, then they all flew at high speed toward the open sea and soon disappeared.

Three days later, on 24 June, an American businessman, Kenneth Arnold, reported that when flying his private Piper Club aeroplane near Mount Rainier in the Cascades, Washington, searching for the debris of the Marine Corps C-46 transport that had crashed against the south shoulder of Mount Rainier the night before, he observed nine disk-shaped, apparently metallic, objects flying in 'a diagonal chain-like line' and making an undulating motion 'like a saucer skipping over water'. According to Arnold's report, the objects performed impossible manoeuvres in the sky, before flying off at supersonic speed to disappear in the direction of the Canadian border.

As Arnold had been a deputy sheriff and was a reputable businessman, as well as an experienced mountain air-rescue pilot, his story was taken seriously and the term 'flying saucer' came into being. It was therefore used widely over the next few weeks when the media spread Arnold's story nationwide and encouraged a spate of similar sightings, many of which were hoaxes, some of which were by trained observers and seemed highly credible.

By this time the US military, while publicly ridiculing the reported sightings, were secretly in a state of panic over their own plague of UFO sightings: the first, on 28 June, over Maxwell Air Force Base in Montgomery, Alabama; the next, on 29 June, near Alamogordo, New Mexico, right over the top-secret White Sands Proving Ground; then, on 8 July, a whole spate of sightings of spherically shaped, white aluminium-coloured objects flying over Muroc Air Base (now Edwards AFB), the supersecret air force test centre in the Mojave Desert.

Because these particular sightings were made by trained technicians and pilots, and because the reported objects were appearing increasingly over top-and-supersecret military research bases, there was a growing suspicion in intelligence circles that the men and material deported from Nazi Germany to Russia had led to a dangerous Soviet lead in space technology.

In a now declassified Memorandum for Record dated 25 April 1952, containing facts for discussion by the Special Study Group and marked for the attention of USAFE, West Germany, the Air Section, USFA, Austria, the Allied Air Forces, France, NATO, Italy, and the Joint Intelligence Bureau, London, the study of flying saucers, amongst 'other advanced aerial delivery systems' is recommended.

While on the one hand stating that 'current estimates do not reflect the possibility that the Russians may have overtaken the US in advanced guided missile research and development', the report goes on to say: 'The Air Force cannot assume that flying saucers are of non-terrestrial origin, and hence, they could be Soviet.'

This assessment is based on two factors. In the first instance, the memorandum cites the UFO report of an unnamed US Naval officer (probably Navy Commander R.B. McLaughlin) who tracked a 'saucer' with a theodolite and assessed it as flying at an altitude of 56 miles with a horizontal velocity of about 8,000 meters (5 miles) per second and a climbing speed of 4,400 meters (2.7 miles) per second. Stressing that the speed recorded by the theodolite was slightly higher than the speed required for the escape from the gravitational pull of the earth, the memorandum continues: 'It frequently has been stated that such velocities cannot be produced on Earth. Such a statement is correct insofar as our present engineering skills go, but it appears incorrect with respect to theoretical knowledge.' The memorandum then cites

several propulsion methods by which, provided the engineering problems are solved, such speeds could be attained. These include ultra high speed engines using fuels composed of beryllium oxidized by ozone, liquid hydrogen enriched by stable hydrogen atoms, a gas consisting of pure hydrogen atoms, or a variety of ionized substances.

The Memorandum's second stand against the extraterrestrial hypothesis is based on the reports of astronomers, which at that time suggested strongly that even if traveling at the speed of light, any object coming from outside the planetary system would be 'ascertained by the astronomical patrol (daily photographs of the skies) at least four years in advance of its arrival'. The Memorandum concludes: 'These leads, coupled with the data of the Air Technical Intelligence Centre concerning Soviet progress in the design of missile engines, definitely underscore the immediate requirement for a thorough investigation of Russian capabilities in this field.'

The 'leads' mentioned include: firstly, Constantine E. Tsiolkovski's initial investigations in the field of high altitude and interplanetary flying, his anticipation of the need for rocket propulsion, and his known interest in 'circular, hyperbolic, and spherical airframes'; secondly, the formation, in April 1924, of a Soviet organization for the development of rockets and society for interplanetary travel, both of which were attached to the then Military Air Academy, which was interested in the military implications of these matters and scheduled the first experimental flights for 1928; thirdly, the fact that a patent for a 'flying saucer with a circular fixed wing' had been taken out in the United States on March 22, 1932; and, finally, the knowledge that 'the saucer sightings in the US tend to cluster around key development stations such as atomic plants, guided missile experimental areas, and Wright-Patterson Air Force Base'.

The Memorandum also points out that the Russian magazine, *Red Fleet*, in its 12 October 1952 edition, had announced that the Soviet Union was planning to build a 'moon rocket', that the world's only solar power institute was then at Tashkent, USSR, and that Russian efforts in the field of cosmic rays operated with a high degree of security.

The Memorandum concludes with the unequivocal statement: 'It must be remembered that the first sightings were made over Scandinavia, and in the US, over the Northwest. This would be in line with a hypothetical range extension from Soviet bases.'

In the words of Dr Eduard Ludwig:

> The surprise of scientists the world over at the astounding results of the German V-2 was no less than that which is produced today by the appearance of the mysterious 'flying disks'... The future will show whether the 'flying disks' are only the products of imagination or whether they are the results of a far-advanced German science which, possibly, as well as the nearly finished atomic bombs, may have fallen into the hands of the Russians.

Forthcoming events would prove that if not exactly right, certainly he was not far wrong.

In a series of interviews given to the West German press in 1952, a former Luftwaffe engineer, Flugkapitän Rudolph Schriever, then resident at Hökerstrasse 28 in Bremerhaven-Lehe, West Germany, claimed that in the spring of 1941, when an engineer and test pilot for the Heinkel factory in Eger, he started thinking of an aeroplane that could take off vertically like a helicopter. These thoughts led him to the concept of an 'arched, domed, and rounded cabin' in the centre of multiple, circular, adjustable wings that would be driven by a turbine engine, also located in the centre of gravity, under the capsule containing the pilot's cabin. A model of this vertical-rising 'flying top' was completed the following year and test-flown on 1 June 1942. This being successful, work began on a larger prototype, fifteen feet in diameter. Many engineers dealt with various aspects of the project in different areas of the occupied territories. By the summer of 1944, Schriever had been transferred to Prague, where with his colleagues, Walter Miethe (an engineer from the Peenemünde V-1 and V-2 program), another engineer, Klaus Habermohl, and the Italian physicist, Dr Guiseppe Belluzzo (from the Riva del Garda complex), he constructed an even larger, piloted model of his original prototype. Since by this time the first Messerschmitt jets were flying, Schriever and his team, now working in the East Hall of the BMW plant near Prague, redesigned Model 3, replacing its former gas-turbine engines with an advanced form of propulsion that utilized adjustable jets.

An article about 'Project Saucer' (*Projekt Untertasse*) was later published in *German Secret Weapons of the Second World War* (1959) by Major Rudolph Lusar, and included reproductions of the flying-saucer

drawings of Schriever and Miethe.

According to Lusar, the flying saucer was constructed with ‘special heat-resisting material’ and consisted of ‘a wide-surface ring which rotated around a fixed, cupola-shaped cockpit’. The ring consisted of ‘adjustable wing-disks which could be brought into appropriate position for the take-off or horizontal flight, respectively’. Miethe then developed ‘a discus-shaped plate of a diameter of 42 metres (138 feet), in which adjustable jets were inserted’. The completed machine had a height from base to canopy of 32 metres (105 feet).

Schriever claimed that his ‘flying disk’ had been ready for testing in early 1944, but with the advance of the Allies into Germany, the test had been cancelled, the machine destroyed, and his designs either mislaid or stolen. This ties in with the fact that the BWM plant stopped work on 9 May 9 1945, as the Russians advanced it was overrun by Czechoslovakian Patriots, and many of the Germans then fled for their lives. These included Schriever, who claims that the saucer prototype was blown up by his own men to prevent it from falling into the hands of the Russians. Schriever then fled to the west, reached the American lines, and eventually made it back home to Bremerhaven.

Schriever’s recollection of the test flight date is contradicted in certain details by alleged eye-witness Georg Klein, a former engineer with Albert Speer’s Ministry for Armament and Ammunition, who told the press that he had actually seen the test flight of the Schriever disk, or one similar, near Prague on 14 February 1945.

A certain doubt may be cast on Klein's date, since according to the *War Diary* of the 8th Air Fleet, 14 February 1945 was a day of low clouds, rain, snow and generally poor visibility - hardly the conditions for the testing of a revolutionary new kind of aircraft. Nevertheless, according to author Renato Vesco, the test flight of a machine called the *Kugelblitz*, or Ball Lightning Fighter - which was rumoured to be a revolutionary kind of supersonic aircraft - was conducted successfully over the underground complex of Kahla (near the underground rocket complex of Nordhausen, where the Peenemünde rocket team were then located) in Thuringia, sometime during that February of 1945.

These various sightings could be explained by the fact that just as parts of Schriever’s flying saucer project were being designed, tested and

constructed in many different areas of the occupied territories, so other 'all wing' experimental prototypes were being developed by other designers.

One of those who may have been involved in Projekt Saucer is Heinrich Fleißner, of Dasing, Augsburg, in the Federal German Republic. Interviewed for the 2 May 1980 edition of *Neue Presse* magazine, the then 76-year old Fleißner claimed that he had been a technical consultant on a jet-propelled, disk-shaped aircraft that had been constructed by a team of technicians in Peenemünde, though the parts had been built in many other places. According to Fleißner, Hermann Göring had been the patron of the aircraft and had planned to use it as a courier plane. At the end of the war, the Wehrmacht destroyed most of the plans and a few of the 'unimportant' drawings fell into the hands of the Russians.

(The notes and drawings for Fleißner's flying saucer, first registered in West Germany on 27 March 1954, were assigned to Trans-Oceanic, Los Angeles, California on 28 March the following year and registered with the United States Patent Office on 7 June 1960.)

As early as 1939 Dr Alexander Lippisch, at Messerschmitt, Augsburg, was developing his Delta-Rocket Jet ME 163 and testing its 'circular wing' in the wind tunnel of the AVA company at Göttingen. Meanwhile, Arthur Sack, of Machern, near Leipzig, had for years been obsessed with the idea of disk-shaped aircraft (first conceived, in fact, by the 19th century German mathematician and aeronautical theorist Wilhelm Zachariae). He tested various models at the model-aeroplane competition at Leipzig-Mockau on 27 and 28 July 1939, with disastrous results. A larger, piloted model, the AS 6, was constructed at the Mitteldeutsche Motorenwerke factory in Leipzig and failed to fly during its test flight at the beginning of February 1944, on the airfield at Brandis, near Leipzig. He tried again at Brandis on 16 April 1944, but the aeroplane barely lifted off the ground. Shortly after, the Allied advance brought Sack's experimentation to a halt for all time.

Viktor Schauberger claimed to have designed and constructed a small, remote-controlled flying saucer in 1940 in the Kertl aircraft company in Vienna. Reportedly, during a test conducted in 1943, the saucer went through the ceiling, but by and large it was otherwise unworkable. Later, Schauberger was allocated some Czechoslovakian engineers to help him expand his project, but when the war came to an end, some of his plans went to the Russians and others were claimed by the Americans. According to

Schauberger, when he went back to work on his flying saucer project in 1958, aided by his son, the American authorities invited both of them to the United States, where they remained for several months, working on various projects, none of which turned out well. Schauberger died later that year.

Hermann Klaas, from Mühlheim, West Germany, a biotechnician specializing in aerodynamic phenomena, is another who claims to have worked on various remote-controlled models for disk-shaped aircraft during World War II. The most common model was 2.4 metres in diameter and propelled by an electro-engine supplied by the Luftwaffe. According to Klaas, these models were similar to those then being developed by Schriever, Habermohl, Miethe, and Belluzzo in Böhmen (Czechoslovakia) and Breslau (now Wrocklaw, Poland).

The stories of Rudolph Schriever and Georg Klein therefore share common ground. In an interview given to the Zürich newspaper *Tages-Anzeiger* on 19 November 1954, Klein insisted that flying saucers were top-secret weapons of the US and Russia, based on the German prototypes. At Breslau, in May 1945, the Russians captured, along with many leading technicians, a 'scale model' of a 'pilotless, ray-guided disk' that had been built at Peenemünde. At the close of the war, Walter Miethe went to America with Werner von Braun, Dornberger, and hundreds of other members of the Peenemünde rocket program; and both the Russians and the Americans were therefore in possession of the technology. There were, Klein stated, two kinds of modern saucer: one with a diameter of about 52 ft and powered by five jets; the other with a diameter of about 138 ft and powered by twelve jets. Klein supported the view that the flying saucers could remain stationary in the air and make sharp, right-angled turns. Stability, he said, was attained with a device based on the principle of the gyroscope. Klein also insisted that flying saucers developed in Canada by John Frost, former colleague of Sir Frank Whittle, had reached speeds of up to 1,500 mph and were inspected by Britain's Field-Marshal Montgomery.

Lusar supports this story, as well as confirming that Schriever was involved in Projekt Saucer and Miethe, though initially working under Werner von Braun for the United States' first rocket centre in the White Sands Proving Ground, New Mexico, joined the A.V. Roe (AVRO-Canada) aircraft company in Malton, Ontario, reportedly to continue work on disk-shaped aircraft, or flying saucers - just as Habermohl was thought to be doing

with the Russians.

US intelligence was seriously concerned by the possibility that the flying saucers being sighted by so many were not of extraterrestrial origin, but were based on the German designs and being constructed and flown by Russians - and, possibly, Canadians.

Their suspicions about Russian-made flying saucers would not have been eased by the fact that in August 1952 it was revealed on French radio and in the German magazine, *Der Flieger*, that according to Dr Waldermar Beck a flying saucer had crashed at Spitsbergen, Norway, and its remains had been studied by the Norwegian rocket expert, Dr Noreal, as well as some unnamed German experts. The flying saucer carried no crew and had been flown by a radio piloting system that malfunctioned. It was 47 metres in diameter and consisted of 'an exterior disk provided at its peripheral with 46 automatic jets'. The disk was designed to pivot around the central sphere, which contained the measurement and remote-control panel. According to Dr Noreal, the saucer had a radio piloting transmitter with a nucleus of plutonium transmitting on all wave lengths with 934 hertz, a measure that was then unknown. The steel used in its construction was of an unknown alloy. The measurement instructions on the control panel were in Russian.

Regarding US suspicions about Canadian flying saucers, a declassified CIA report based on 'unevaluated information' and dated 18 August 1953 reveals that they may have believed this was possible because: 'According to recent reports from Toronto, a number of Canadian Air Force engineers are engaged in the construction of a "flying saucer" to be used as a future weapon of war. The work of these engineers is being carried out in great secrecy at the A. V. Roe Company factories.' This is followed by the observation: '"Flying saucers' have been known to be an actuality since the possibility of their construction was proven in plans drawn up by German engineers toward the end of World War II.'

US concern was only increased when the former Luftwaffe engineer, Rudolph Schriever, not long before he died, began talking to the media about Projekt Saucer. In another declassified CIA document dated 27 May 1954, it is suggested that Projekt Saucer resulted in three designs: 'One, designed by Miethe, was a disk-shaped aircraft, 135 feet in diameter, which did not rotate; another, designed by Habermohl and Schriever, consisted of a large rotating

ring, in the centre of which was a round, stationary cabin for the crew.' The report does not describe the third design, but goes on to confirm that when the Soviets occupied Prague, 'the Germans destroyed every trace of the "flying saucer" project and nothing more was heard of Habermohl and his assistants'. The report also states that in Breslau, the Soviets managed to capture one of the saucers built by Miethe; and that Rudolph Schriever had died recently in Bremen-Lehe, where he had been living since the end of the war.

This unease at the possibility of highly advanced Soviet or Canadian flying saucers may have been heightened even more by the knowledge, related in the same report, that a recent issue of *Forces Aériennes Francaises* (a monthly periodical published by the Comité d'Études Aéronautiques Militaires - Study Committee on Military Aeronautics - which was headed by General P. Fay, Chief of Staff of the Air Force) contained an article suggesting that 'supersonic interstellar ships powered by cosmic energy are possible'. Since the article was written by Lieutenant Plantier of the Ecole de L'Air de Salon (a prestigious aeronautical school), its acceptance by the magazine was read as an indication that the French Air Force was admitting to the existence of flying saucers.

Certainly, by 28 August 1954, a formal US Headquarters Strategic Air Command 'Request for Intelligence Information' was asking for 'a summary of information of knowledge Russia has pertaining to flying saucers'.

To accept that the Soviets could have been flying disk-shaped craft based on the German designs, we have to accept also that the Schriever-Habermohl-Miethe-Belluzzo machine, even if completed, would have had the capabilities of the flying saucers sighted shortly after the war.

Not too much is known about the men who worked on Projekt Saucer. We know that Rudolph Schriever was a Luftwaffe engineer and test pilot who insisted, right up to the day he died, that he had worked on the project. Walter Miethe worked on the V-1 rocket program at Peenemünde (where the saucer was said to have been constructed) and was one of the engineers taken to America with Dornberger and von Braun; he was then hired by the A.V. Roe Company (AVRO-Canada), where he worked on the disk-shaped aircraft, the Avrocar.

Of particular interest regarding the Avrocar, or Omega, is that according

to the West German magazine, *Hobby* (14 December 1977) another German engineer, Andreas Epp, who came from Schriever's home town of Bremerhaven, also worked on the Avrocar project.

Nothing is known about Habermohl, other than what can be gleaned from the many unsubstantiated reports claiming that he worked on the saucer project in Breslau, before being captured by the Russians. Nor is there any information on the background or fate of the Italian physicist, Guiseppe Belluzzo; though the fact that he was an Italian working for the Germans during the war suggests that he was involved either through the supersonic research centre at Guidonia, near Rome, where the Germans supervised extensive research in supersonic aerodynamics, or the underground laboratories at Riva del Garda where, as we have seen, many experiments regarding special heat-resistant metals and the boundary layer were undertaken.

As for Georg Klein, who says that he communicated frequently with Belluzzo, the nature of his involvement with Projekt Saucer is obscure, and we only know for certain that he was a former engineer with Albert Speer's Ministry for Armament and Ammunition, and that after the war he moved to Zürich, Switzerland, where he continued to work in engineering.

What *is* known, then, is that all four of them were in positions to at least have been involved in certain aspects of Projekt Saucer.

Germany had the advanced technology required to create the *Feuerball*, or foo fighter, but the capabilities shown by the flying saucers sighted after the war could only have come through a perfected means of controlling the boundary layer and creating frictionless air flow. Relative to this, it is known that throughout the war Nazi Germany's great wind tunnels were being used for extensive research into suction with regard to ultra-high speed flight - with impressive results.

Certainly, before the end of the war, the ME-109G modified fighter plane had flown a number of experimental flights using its compressor as a suction pump as a means of decreasing drag and increasing speed. It is also known that by 1944, professors Pradtl and Busemann had completed the plans for a high-speed fighter designed to dramatically reduce aerodynamic friction, if not obliterate it altogether. Thus by the closing months of the war there were many rumours in German aeronautical circles about the imminent appearance of radically different aeroplanes, without wings, tails, rudders or

other surface protuberances and powered by special turbines or jet engines, that would move through the air ‘like a sponge through water’ or, as Sir Ben Lockspieser later put it: ‘like a bar of wet soap slips through the fingers’. In other words: at ultra-fast speeds and with extraordinary manoeuvrability.

The Schriever-Habermohl-Miethe-Belluzzo flying saucer, or the *Kugelblitz* described by Renato Vesco in *Intercettateli Senza Sparare*, could have been just such an aircraft.

Indeed, while Vesco makes no mention of the Schriever-Habermohl disk, his *Kugelblitz*, or Ball Lightning Fighter, certainly appears to be the same machine. According to Vesco, the *Kugelblitz* was a larger, piloted version of the small, whirling, antiradar device, the *Feuerball*, which harassed Allied aircraft during the closing months of the war.

Projects that German scientists had been working on during the closing stages of the war indicate that this piloted ‘flying saucer’ could have had a form of radio that can cancel at the pilot’s discretion the return signals, or blips, from the enemy’s radarscope and thus render the saucer ‘invisible’ to the enemy. It could also have had electromagnetically or electroacoustically controlled firing weapons, cannons that spit ignition-damaging gas instead of shells, and possibly even the first, unsophisticated laser or pulse-beam weapons. Lastly, it could have been made from a combination of *Luftschwamm*, or aerosponge, and an alloy that could withstand enormous pressures and a temperature of 1000° Centigrade - as was being created in the immense underground Riva del Garda research complex. In short, a remarkably advanced, vertical-rising jet fighter, shaped like the contemporary flying saucer.

Did such a machine exist? It certainly seems so. We *do* know that a machine very much like it, supposedly designed and constructed by Schriever, Miethe, Habermohl and the mysterious Dr Belluzzo, was reportedly test-flown sometime in February 1945 in the area of the underground complex at Kahla, in the southern Harz mountain range of Thuringia. According to witness Georg Klein, the machine reached a height of about 40,000 feet at a speed of approximately 1,250 mph.

Flugkapitän Rudolph Schriever was adamant that while the flying saucer was destroyed to prevent it falling into the hands of advancing Soviet troops, the documentation survived and was widely distributed between the Allies and the Soviets, as were many scientists and much equipment. Georg Klein,

who concurred with the basic details of this scenario, was equally adamant that ‘the “saucers” are at present being constructed in accordance with German technical principles’ and could ‘constitute serious competition to jet-propelled aeroplanes’.

In short, the flying saucers were man-made.

Chapter 5

-

Spinning Disks and Flying Saucers

On 16 April 1897, at the height of the Great Airship Scare, the citizens of Linn Grove, Iowa, watched an airship pass slowly overhead, then land briefly a few miles outside town. When the airship took off again, it emitted 'two large boulders of unknown composition'. Similarly, one of the six objects seen by Harold Dahl on 21 June 1947 near Maury Island expelled a rain of 'small, whitish metallic fragments' that were obviously hot and gave off steam when they plunged into the waters of Puget Sound.

As we shall see, a 'whitish metallic' colouring is the one most attributed to flying saucers; but the importance of the Maurey Island case is that *some* form of debris was reported as having been spewed out of what seemed like an 'ailing' craft before it flew off and disappeared with the others.

Inexplicably, the US Fourth Air Force A-2 Intelligence Branch did not investigate the Maury Island sighting area until 31 July - ten days after the event - when their agents, Captain William Davidson and Lieutenant Frank M. Brown, failed to find the countless 'small, whitish metallic fragments', but were given what appeared to be 'pieces of porous lava' by the individual who had started the whole UFO scare with his more widely publicized sighting of 24 June - namely, Kenneth Arnold, who had been hired by *Fate* magazine to investigate the case.

Arnold sent his own UFO debris to be examined at the chemical laboratory of the University of Chicago, where the pieces were classified as 'slag of volcanic origin'. The rest of the debris, in the care of the A-2 intelligence agents, was lost when the B-25 taking them back to Hamilton Air Force Base in California crashed near Kelso, Washington. Later, authorities at McChord AFB confirmed that the aeroplane had been carrying classified material and that while the crew chief, Master Sergeant L. Taff, and a passenger, Technician Fourth Grade Woodrow D. Mathews, had managed to parachute to safety, the two intelligence agents had died in the crash.

This was singularly ironic in view of the fact that it was the aerial search for the debris of a crashed Marine Corps C-46 transport that had led Arnold to his momentous sighting of nine UFOs as they flew in formation over

Mount Rainier, also in the Cascades, on the border between the United States and Canada.

Perhaps not surprisingly, shortly after the A-2 intelligence agents and their UFO debris were lost in that second air crash, Dahl and the man to whom he had submitted his written report, his direct superior in the Puget Sound harbour patrol, Fred L. Christman, admitted (reportedly under pressure from the Army's remaining A-2 intelligence agents) that the UFO fragments were only pieces of mineral formation picked up at random on Maury Island and shown to the press to heighten interest in the UFO story.

There the Maury Island Mystery ended.

These two incidents are among the very few in which UFOs have reportedly 'dropped' or 'expelled' debris, though others have left debatable physical traces of their presence. However, in general it has to be accepted that most UFO reports do not include debris, though the initial postwar sightings established the appearance, characteristics and capabilities of what we now view as being standard for UFOs, or flying saucers.

The Maury Island incident was exploited by various people to the degree where separating the truth from the fiction in the historical records is now virtually impossible. Nevertheless, while there are those who still think it was a hoax, it *was* the first major postwar UFO sighting; and Dahl's descriptions of the UFO, whether or not invented, set the pattern for most of the future descriptions of UFOs.

Dahl said that the Maury Island UFOs were shaped like 'inflated inner tubes' and had no structural protuberances, appeared to be about 100 feet across, had 'holes' in their centres and portholes around their perimeters, with an observation window in their undersides (possibly the 'hole' in the centre), and looked metallic. They could hover virtually motionless in the air and were seen to ascend rapidly and vertically.

When Kenneth Arnold saw UFOs four days later, neither he nor anyone else had heard of the Maury Island sighting. Nevertheless, Arnold, a trained mountain-rescue pilot, offered remarkably similar descriptions of the nine unknowns that he witnessed flying over Mount Rainier in the Cascades. At first assuming the distant objects were P-51s, Arnold then realised that they were devoid of tail assemblies or other protuberances - other than, in the words of Flammonde, 'an apparent cockpit with a full window canopy' - and

that the whole fuselage of the craft resembled a single, particularly graceful, swept-back ‘wing’ or ‘boomerang’. While the objects appeared to be capable of extraordinary aerial manoeuvres, they flew horizontally like ‘speedboats on water’ or like ‘a saucer would if you skipped it across the water’.

Though Arnold had trained as a pilot, he was not a military man. For this reason, we turn to *The Report on Unidentified Flying Objects*, in which Captain Edward J. Ruppelt, the Air Force’s most assiduous and honest UFO investigator, relates that four days after the Arnold sighting, on 28 June, at 3.15pm, an Air Force pilot, when flying his F-51 near Lake Meade, Nevada, saw a formation of five or six ‘circular objects’ off his right wing. That evening, four Air Force officers, two pilots, and two intelligence officers from Maxwell AFB in Montgomery, Alabama, saw a ‘bright light’ traveling across the sky, zigzagging with bursts of high speed, and making a sharp, 90-degree turn before shooting off.

On 4 July, at 11.00am, in Portland, Oregon, a carload of people driving near Redmond saw four ‘disk-shaped objects’ streaking past Mount Jefferson. At 1.05pm a policeman in the parking lot behind the Portland City Police Headquarters looked up to see ‘five large, disk-shaped objects’ flying at a high rate of speed and ‘oscillating about their lateral axis’. Minutes later, two other policemen, both former pilots, saw three similar objects ‘flying in trail’ and four harbour patrol crewmen saw flying disks ‘shaped like chrome hub caps’ and ‘oscillating’ as they flew overhead. Numerous citizens of Portland saw similar objects at approximately the same time.

That night, a United Airlines crew flying near Emmett, Idaho, reported seeing five unidentified flying objects which were ‘thin and smooth on the bottom and rough-appearing on top; two days later the crew of an Air Force B-25 saw ‘a bright, disk-shaped object’ flying lower than the aircraft; then a pilot flying across Fairfield-Suisun AFB, California, saw something that was ‘oscillating on its lateral axis’ as it traversed three-quarters of the sky in a few seconds.

However, the sighting that really made the Air Force sit up and take an interest in UFOs was the one that occurred four days later, on 8 July, at Muroc Air Base (now Edwards AFB), the supersecret Air Force test centre in the Mojave Desert, California.

At ten in the morning a test pilot observed what he thought was a weather balloon until he noticed that it was going *against* the wind. Studying

it more carefully, he thought it was ‘spherically shaped and yellowish white in colour’. It later transpired than ten minutes earlier several other officers and airmen had seen three similar objects, but of a ‘silver’ appearance, heading in the same direction. Two hours later, a crew of technicians on Rogers Dry Lake, adjacent to Muroc Air Base, observed a ‘round object, white aluminium colour’ in the vicinity of a formation of two P.82s and an A-26 aircraft which were carrying out a seat-ejection experiment. As the ejected experimental seat-and-dummy fell, the object followed it down, but drifting *against* the wind, until it was seen to have ‘a distinct, oval-shaped outline, with two projections on the upper surface which might have been thick fins or nobs’. These projections crossed each other at intervals, suggesting ‘either rotation or oscillation of slow type’. No means of propulsion were noticed and the object made no sound. It had the colour of an ‘aluminium-painted fabric’. Four hours later, the pilot of an F-51 flying at 20,000 feet spotted a ‘flat object of a light-reflecting nature’ which had no vertical fin or wings. He tried to pursue it, but could not climb high enough.

Already, the basic characteristics of UFOs had a striking consistency. They were semi-circular or circular, usually domed or with viewing windows on the top or bottom, and could resemble either an inverted plate or two plates together, one placed upside down on the other. They were usually of a whitish-grey or metallic appearance. They flew horizontally with a slight bouncing motion, like ‘speedboats on water’ or ‘a saucer would if you skipped it across the water’; but they could also change direction rapidly, ascend and descend vertically, and in general perform theoretically impossible aerial manoeuvres at remarkably low and high speeds. Most of them ‘oscillated’, but were silent and showed no means of propulsion.

If the Harold Dahl sighting at Maury Island was a hoax, it was a brilliantly conceived hoax indeed, because the UFOs described above were remarkably similar in configuration and envisaged potential to the ‘flying wings’ and ‘humped airfoils’ that were then being developed in the National Physical Laboratory and other aeronautical establishments through the US and Canada. In turn, these were based on the boundary-layer experiments that had already been conducted extensively in Nazi Germany.

By then, it had been widely accepted that control of the boundary layer was the key to hithertofore impossible high speeds and extraordinary

manoeuvrability in flight; and that the ‘suction’ method - in which air is sucked through air vents, or slots, in the wing, to be expelled as added propulsion - was superior to the ‘blowing’ method of standard rotors, or propellers. Because of this, numerous experiments had been conducted on elliptical, boomerang-shaped, and ‘humped’ airfoils, or flying wings, lined with suction slots - resulting in such aircraft as the Armstrong Whitworth twin-engined, all-wing jet, the AW-52 Boomerang. When one of the AW-52 Boomerangs crashed, further development of the model ceased; but it was followed by aircraft with an even greater sweepback and a more strikingly ‘triangular’ form - such as the Hawker Siddeley Group's ‘Aero Delta’ aircraft, the Avro 698 and Avro 707B, as well as other ‘flying wing’ jet-propelled prototypes. Such aircraft, with their elliptical, semicircular, boomerang, or triangular shapes, undoubtedly were the forerunners of the completely circular, supersonic aircraft known as ‘flying saucers’ and seen mostly by trained observers over top-secret military establishments.

Nevertheless, while the abovementioned sightings offered purely visual support for the general appearance of the UFOs, the *physical* reality of the UFOs remained in doubt. Ironically, the removal of those doubts began with a ‘classic’ UFO encounter that may in fact have been a ‘classic’ case of misidentification.

It was also the first instance of a human death being caused by a UFO.

The ‘Mantell Incident’ began at 1.15pm on 7 January 1947 when the Kentucky State Highway Patrol phoned the control tower operators at Godman AFB, Louisville, Kentucky, to inform them that a lot of people from Maysville, a small town eighty miles east of Louisville, had reported seeing a strange craft. Though nothing was known to be flying in the area at that time, the state police called back about fifteen or twenty minutes later with more reports of a ‘strange craft’ seen over the towns of Owensboro and Irvington, west of Louisville. Most witnesses described the objects as being ‘circular, about 250 to 300 feet in diameter’ and moving westward at high speed.

While the control tower operators at Godman AFB still had no record of anything in the air, they deduced from the reports that as the UFO would have had to pass north of Godman to get from Maysville to Owensboro, it might return.

It did. At 1.45pm it passed over Godman and was witnessed by the

control tower operators, the base operations officer, the base intelligence officer, and several other key personnel, all of whom, after studying the UFO through binoculars, decided that they could not identify it.

At 2.30pm four F-51s were despatched to take a look at the object and try to identify it. One of the aeroplanes was forced to return to base due to a lack of fuel, but the other three, led by the flight leader, Captain Thomas F. Mantell, climbed to 10,000 feet in pursuit of the object. At 2.45pm Mantell called the tower and said, 'I see something above and ahead of me and I'm still climbing.' This statement was confirmed by all of the people in the tower. What is *not* confirmed by everyone is that Mantell then said, 'I've sighted the thing. It looks metallic and it's tremendous in size... Now it's starting to climb!' Everyone in the tower *did* agree that Mantell then said, 'I'm going to 20,000 feet.'

According to the statements they gave later, Mantell's two wing men were then at 15,000 feet and trying frantically to call their flight leader, who had climbed above them and was out of sight. By the time the wing men had returned to their base at Standiford Field, north of Godman, Mantell had crashed and died.

Though Mantell's disputed statement, 'It looks metallic and it's tremendous in size... Now it's starting to climb!' was spread far and wide, the official stance was that Mantell had mistaken the planet Venus for a UFO and blacked out due to lack of oxygen when climbing too high in pursuit of a UFO that wasn't actually there. However, ATIC's Project Sign team soon discovered that this could not have been possible. On the other hand, two people, including an astronomer, had reported seeing a balloon in the sky at the time and subsequent investigations by the Project Sign team revealed that a classified skyhook balloon project may have been operating out of Clinton County AFB in northern Ohio. As the winds were such that a skyhook balloon launched from Clinton County AFB could have been seen from Godman AFB even as high as 60,000 feet, it is possible that Mantell *could* have died chasing just such a balloon.

Two things cast doubt on this possibility. One is that few of those who knew Mantell, an experienced pilot, could imagine him spending so much time - nearly twenty minutes - in pursuit of a balloon without realising what it was. Indeed, according to Captain Ruppelt, one of Mantell's friends went on record as saying that Mantell was one of the most cautious pilots he had

known and he could not conceive of him disregarding his shortage of oxygen.

'The only thing I can think,' Ruppelt reports this friend as saying, 'was that he was after something that he believed to be more important than his life or his family.'

According to Ruppelt, the second thing that casts doubt on the likelihood of Mantell chasing a skyhook balloon is that while the people who were working with the early skyhook projects claimed that they could remember operating out of Clinton County AFB in 1947, none of them were willing to be pinned down to that particular date.

Finally, in *The Report on Unidentified Flying Objects*, Ruppelt comments: 'Somewhere in the archives of the Air Force or the Navy there are records that will show whether or not a balloon was launched from Clinton County AFB, Ohio, on January 7, 1948. I never could find those records.'

Whether or not the unfortunate Captain Mantell died pursuing something 'metallic' and 'tremendous in size' will never be known, but certainly many of the UFOs being seen at that time fitted those two descriptions. Mantell's death at least rocked the Air Force and made them sit up and take notice of the UFO phenomenon - but what really got them moving was an extraordinary sighting that took place eighteen months later.

At 2.45am on 24 July 1948, in the middle of a scheduled Eastern Airlines trip from Houston, Texas, to Atlanta, Georgia, the pilots, Clarence S. Chiles and John B. Whitted, saw an unidentified light straight ahead of them and closing fast. Chiles, the captain, quickly put his DC-3 into an evasive tight left turn. The UFO flashed by about 700 feet to the right and then pulled up in a steep climb.

Chiles and his co-pilot, Whitted, both got a good look at the UFO and later agreed that it had resembled a B-29 fuselage, with its underside emitting a 'deep blue glow' and a '50-foot trail of orange-red flame' shooting out the back. It also had 'two rows of windows from which bright lights glowed'. (Two years later, on 31 March 1950, the pilots of another DC-3, flying from Memphis, Tennessee, to Little Rock, Arkansas, almost collided with a UFO which they assumed was disk-shaped because of the 'circular arrangement of eight or ten "portholes", each one glowing from a strong bluish-white light' that seemed to come from the inside of the object.) Minutes after the sighting by Chiles and Whitted, a crew chief at Robins Air Force Base in Macon,

Georgia, witnessed ‘an extremely bright light’ passing overhead and traveling at high speed. Another pilot, flying that night near the Virginia-North Carolina state line at approximately the same time as the DC-3 was ‘buzzed’ by the UFO, reported seeing ‘a bright shooting star’ in the direction of Montgomery, Alabama.

The sightings were correlated by ATIC and according to Captain Ruppelt their findings confirmed that the UFO which nearly collided with the airliner would have flown almost over Macon, Georgia, after passing that aircraft - and it had been turning in the direction of Macon when last seen.

Because the story of the crew chief at Robins AFB, 200 miles away, seemed to confirm the sighting, not to mention the report from near the Virginia-North Carolina state line, the Air Force was finally convinced that the UFO phenomenon was real, that it involved solid, moving objects, and that it warranted serious examination.

When ATIC’s Project Sign submitted an official Estimate of the Situation, the UFOs stepped out of mythology and into reality.

The saucer-shaped configuration and manoeuvring capabilities of the UFOs had been verified, but confirmation of what appeared to be their unusually large size and remarkable top speeds was still missing. A Navy Commander, R.B. McLaughlin, had worked throughout 1948 and 1949 with a team of engineers, technicians and scientists on a classified skyhook balloon project, located in the Navy’s top-secret guided-missile test and development area in the White Sands Proving Ground, New Mexico. On 24 April 1949, at 10.00am in an ‘absolutely clear’ Sunday morning, when McLaughlin and his team were preparing to launch one of their huge skyhook balloons (100 feet in diameter), the whole crew saw a UFO which, though high up, was clearly ‘elliptical in shape’ and had a ‘whitish-silver’ colour. With a theodolite, stop-watch, and 25-power telescope, they were able to track the UFO as it dropped from an angle of elevation of 45° to 25°, then abruptly shot upward and disappeared. Even after putting a reduction factor on the data recorded on the theodolite, McLaughin estimated that the UFO was approximately 40 feet wide and 100 feet long, had been at an altitude of fifty-six miles, and was traveling at seven miles per second, or approximately 25,000 mph.

According to Captain Ruppelt, there was some ‘legitimate doubt’ as to the accuracy of the speed and altitude figures that Commander McLaughlin’s team arrived at from the data they measured with the theodolite. However, he

points out that ‘this doesn’t mean much’ and that even if they had been off by a factor of 100 per cent, the speeds and altitude of the UFO would be ‘fantastic’. He also reminds us that various members of McLaughlin’s team studied the object through a 25-power telescope and swore that it was a ‘flat, oval-shaped object’.

Shortly after relating this information to the public in an article he wrote for the March 1950 issue of *True* magazine, Commander McLaughlin was transferred back to sea.

Nevertheless, his report had finally confirmed the extraordinary speeds and altitudes reached by UFOs.

Three years later, when the Robertson Panel submitted its infamous recommendations for a mass ‘debunking’ of the UFO phenomenon (see Chapter 12, pages 268-73), its conclusions flew directly in the face of the evidence presented by the Project Blue Book chief, Captain Ruppelt, who was convinced that the UFOs were actual aircraft of highly developed technology. While visual sightings of UFOs were by then in great abundance, what Ruppelt wanted were some sightings which would, in his view, produce enough data to confirm that they were intelligently controlled vehicles.

He found three such sightings.

The first occurred over Haneda AFB, now Tokyo International Airport, in Japan, in late August 1952. The UFO was first observed by two control tower operators who saw a large, brilliant light in the northwest over Tokyo Bay. The light, which was moving, was observed through 7 x 50 binoculars. It had a constant brilliance, was circular in shape, and appeared to be the upper portion of a large, round, dark shape which was about four times the diameter of the light itself. Then, when it moved, the tower operators saw a second, dimmer light on the lower edge of the dark, shadowy portion. This particular UFO was tracked simultaneously by radar and observed by intelligence officers as it flew back and forth across the central part of Tokyo Bay, sometimes almost hovering, then abruptly accelerating to 300 miles an hour. It was pursued by, and ‘deliberately’ eluded, an F-94 plane.

The sighting was thoroughly investigated by the FEAF intelligence officers in the area, then later investigated just as thoroughly by Captain Ruppelt. Both agreed that it was not a weather target, definitely not a star, and that visual and radar lock-ons had proved that it was solid *and* moving. They also proved that each turn the UFO made was constant, and that the

straight ‘legs’ between the turns were about the same length. Indeed, Ruppelt later wrote that the sketch of the UFO’s flight path reminded him very much of the crisscross patterns he used to fly during World War II - and that the only time the UFO had seriously deviated from this pattern was when the F-94 tried to pursue it.

The second sighting was one that occurred on the night of 29 July 1952, when an F-94 attempted to intercept a UFO over eastern Michigan. This sighting was even more interesting in that there was a definite reason for every move the UFO made. First, it made a 180° turn because the F-94 was closing in on it. Next, it alternately increased and decreased its speed - but only increased its speed when the aeroplane was closing in on it and always slowed down when it was just out of range of the aeroplane’s radar.

Adding weight to his argument that such movements could not have been random, Ruppelt submitted a third report - the one he called the ‘best unknown ever’ - a report of an F-84 pilot who chased an object right across Rapid City, south Dakota. According to the pilot *and* the radar operators who had located the object, the target accelerated and decelerated so that there was always *precisely* three miles between it and the F-84 - and it kept this up until the F-84 started running out of fuel and was forced to return to base. Later, both the pilot and the tower controller told Ruppelt that the UFO seemed to have some kind of automatic warning radar linked to its power supply.

This capability has been attributed to every modern UFO, from the German *Feuerballs* and *Kugelblitz* to the more advanced craft seen ‘bobbing’ over mountainous terrain or the buildings of military establishments.

By the mid-1950s ex-Air Chief Marshal of the RAF, Lord Dowding, was backing the UFOs, but reserved his judgement on what they were. Herman Oberth, the ‘father’ of German rocket development, publicly declared that they were interplanetary vehicles. In Belgium, a senator demanded an answer to the UFO mystery from the Secretary of Defence. In France, the French General Staff set up a committee, the *Groupment d'Études des Phénomènes Aériens*, to study UFO reports. In England, the aviation magazine, *Aeroplane*, examined the subject, but refused to come to any definite conclusion. In the Iron Curtain countries, UFOs were widely discussed - but purely as a form of capitalist propaganda. In the United States, two civilian UFO organizations were formed: The Aerial Phenomena Research Organization (APRO), located

in Tucson, Arizona, and the National Investigating Committee for Aerial Phenomenon (NICAP), located in Washington, D.C. Both gained a wide membership, including noted scientists and former military and air force personnel, as well as a great deal of respect internationally for the sane and sober manner in which they investigated major UFO sightings.

The UFOs were widely reported as being flat disks, domed disks, double-domed disks, hemispherical disks, and spherical, elliptical, triangular, or cylindrical in general outline. They were capable of flying soundlessly at remarkable speeds and of making extraordinary manoeuvres. They could ascend and descend vertically, hover impossibly in mid-air, change direction abruptly, follow the terrain of Earth, seemingly automatically, and disappear in 'the blinking of an eye'. They were mostly silvery or a 'whitish-metallic' colour, had 'portholes' or other 'orifices' around their rims, and 'oscillated' around their lateral axes.

The most commonly reported shape certainly resembled the Germans' World War II 'wide-surface ring which rotated around a fixed, cupola-shaped cockpit' or 'large rotating ring, in the centre of which was a round, stationary cabin for the crew'. Last but not least, the UFOs fitting this description invariably showed up on radar screens, were confirmed by theodolites as physical objects, and appeared to fly away when pursued.

In short: the UFOs, or flying saucers, were not as 'alien' as they appeared to be... and possibly originated right here on Earth.

Chapter 6

The UFO Invasion

The guided missile test range at White Sands Proving Ground in New Mexico is spread over many square miles and, with its numerous cinetheodolite camera stations linked together by a telephone system, is fully equipped to track high, fast-moving objects. A cinetheodolite is similar to a 35mm movie camera, except that when a moving object is photographed with it, the developed photograph will also contain three readings that show the time the photo was taken, the azimuth angle, and the elevation angle of the camera. If two or more cinetheodolites photograph the same flying object, it is possible to obtain rough estimates of the object's size, speed and altitude – rough estimates because cinetheodolites do not give accurate readings and too many UFOlogists think they do.

Ruppelt, in *The Report on Unidentified Flying Objects*, relates two incidents which proved for him that the UFO phenomenon was based on sightings of real, solid objects.

On 27 April 27 1950, shortly after a guided missile had been fired from the White Sands Proving Ground and fallen back to earth, Air Force technicians spotted an object streaking across the sky. As most of the camera stations had already unloaded their film, only one camera was able to catch a shot of the UFO before it disappeared. That photo showed only a dark, smudgy object - but it also proved that the object had been moving. A month later, during another missile test, another UFO appeared, and this time two members of the camera teams saw it and shot several feet of film of the 'bright, shiny object' streaking across the sky. That film was subsequently processed and analyzed by the Data Reduction Group at White Sands. By putting a correction factor in the data gathered by the two cameras, they were able to calculate that the object was higher than 40,000 feet, was traveling over 2,000 mph, and was over 300 feet in diameter.

Ruppelt makes it clear that these figures were only estimates, based on the possibly erroneous correction factor. However, what they did prove is that *something* had been in the air and it had been *solid* and moving very fast. The

photos were enough to convince Ruppelt of the reality of the phenomenon, but what shook the Air Force in general were two major flaps that came the following year: the Lubbock Lights and the Fort Monmouth sightings.

As related by Captain Ruppelt, the Lubbock affair began on the evening of 25 August 1951, when an employee of the Atomic Energy Commission's supersecret Sandia Corporation - one with a top 'Q' security clearance - looked up from his garden on the outskirts of Albuquerque, New Mexico, and saw a huge aircraft flying swiftly and silently over his home. He later described it as having the shape of a 'flying wing', about one-and-a-half times the size of a B-26, with six to eight softly glowing, bluish lights on the aft end of its wings.

That same evening, about twenty minutes after this sighting, four professors from the Texas Technological College at Lubbock - a geologist, a chemist, a physicist, and a petroleum engineer -observed a formation of lights streaking across the sky: about fifteen to thirty separate lights, all a bluish-green colour, moving from north to south in a semicircular formation.

Early in the morning of 26 August, only a few hours after the Lubbock sightings, two different radars at an Air Defence Command radar station located in Washington State showed an unknown target traveling at 900 mph at 1,300 feet and heading in a northwesterly direction.

On 31 August two women were driving near Matador, seventy miles north-east of Lubbock, when they saw a 'pear-shaped object' about 150 yards ahead of them, about 120 feet in the air, drifting to the east at less than the take-off speed of a Cub aeroplane. One of those witnesses was familiar with aircraft - she was married to an air force officer and had lived on or near air bases for years - and she swore that the object was about the size of a B-29 fuselage, had a porthole on one side, made absolutely no noise as it moved *into* the wind, and suddenly picked up speed and climbed out of sight in a 'tight, spiralling' motion.

That same evening, an amateur photographer, Carl Hart, Jr., took five photos of a V formation of the same bluish-green lights as they flew over his backyard. Finally, a rancher's wife told her husband (who related the story to Captain Ruppelt) that she had seen a large object gliding swiftly and silently over her house. That object was observed about ten minutes after the Sandia Corporation executive had viewed *his* object; it was described as 'an aeroplane without a body', and the woman said that on the aft edge of the

wing were pairs of glowing lights -an exact description of the Albuquerque sightings made by the Sandia employee.

Subsequent investigation by the Air Force's Project Blue Book team confirmed that the Washington State radar lock-on had been a solid target - not a weather target. It was then calculated that an object flying between that radar station and Lubbock would have been on a north-westerly course at the time it was seen at the two places - and that it would have had a speed of approximately 900 mph, as calculated by the radar.

The five photographs taken by Carl Hart, Jr. were analysed by the specialist Photo Reconnaissance Laboratory at Wright Field. The results showed that the lights, in an inverted V formation, had crossed about 120° of open sky at a 30° per second angular velocity - which corresponded exactly to the angular velocity measured carefully by the four professors from the Technical College at Lubbock. Analysis of the photos also showed that the lights were a great deal brighter than the surrounding stars and that their unusual intensity could have been caused by an exceptionally bright light source which had a colour at the most distant red end of the spectrum, bordering on infrared.

As the human eye is not sensitive to such a light, the light could appear dim to the eye - as many of the Lubbock lights did - but be exceptionally bright on film, as they were on the photographs. While according to the Photo Reconnaissance Laboratory, at that time there was nothing flying that had those particular characteristics, Captain Ruppelt and his fellow investigators were startled by the discovery that the lights on the photos were strikingly similar to those described by the Atomic Energy Commission employee as being on the aft edge of the huge UFO that passed silently over his house.

Did something solid pass over Albuquerque, New Mexico, and fly 250 miles to Lubbock, Texas, at an approximate speed of 900 mph? According to the witnesses, and to the radar and visual-tracking calculations, it did. The Lubbock files were also studied by a group of rocket experts, nuclear physicists and intelligence experts, and they were all convinced that the sightings had been of an enormous, solid object, most likely with a 'highly swept-back wing configuration' and with 'a series of small jet orifices all around its edge'.

According to Captain Ruppelt, the extraordinary findings of the Lubbock investigation, and the furore aroused by the sightings themselves, finally

galvanized a harassed Air Force into action. However, official ‘respectability’ truly came to the UFO problem with the Fort Monmouth sightings that took place a month later at the Army Signal Corps radar centre at Fort Monmouth, New Jersey.

The flap began at 11.10am on 10 September 1951, when a student operator was giving a demonstration of automatic radar tracking to a group of visiting top brass. After spotting an object flying about 12,000 yards southeast of the station, the operator switched to automatic tracking, but failed to hold the object and, in his confusion, blurted out to the VIPs that the object was going too fast for the set - which meant that it was flying faster than any known jet. After three minutes, during which it continued to fly too fast for the automatic radar tracking, the UFO disappeared.

Checks with the weather department revealed that there were no indications of the kind of temperature inversion that, by bending the light passing through it, can create unusual moving shapes or false radar images.

Twenty-five minutes later, the pilot of a T-33 jet trainer, carrying an Air Force major as passenger and flying 20,000 feet over Mount Pleasant, New Jersey, observed ‘a dull, silver, disk-like object’ below him. He described it as thirty to fifty feet in diameter. When the object descended toward Sandy Hook, the T-33 pilot went after it. As he approached, it stopped abruptly, hovered impossibly, then suddenly sped south, made a 120° turn, and vanished out to sea. The Air Force major confirmed this sighting.

At 3.15pm, back at the Fort Monmouth radar centre, a frantic call was received from headquarters, demanding that they pick up an unknown that was flying very high, to the north, roughly where the first UFO had vanished. A radar lock-on confirmed that the UFO was traveling slowly at 93,000 feet - or eighteen miles above the Earth - and it could also be made out visually as a silver speck.

No known aircraft of that period could fly eighteen miles above the Earth.

Next morning, two radar sets picked up another unknown that climbed, levelled out, dived and climbed again repeatedly, too fast for the automatic radar tracking. When the object climbed, it ‘went almost straight up’. The flap ended that afternoon when the radar tracked another slowly moving UFO and tracked it for several minutes, before it disappeared.

Following the sightings, Major General C.P. Cabell, representing the Director of Intelligence of the Air Force, ordered an immediate investigation. In a matter of hours, two officers from the Air Technical Intelligence Centre (ATIC) at Wright-Patterson were on an aeroplane to Lubbock. Once there, they worked around the clock, interrogating everyone involved in the sighting - pilots, radar operators, technicians and instructors - and a couple of days later they were in the Pentagon, submitting their report to General Cabell and other high-ranking intelligence officers. Every word of that meeting was recorded, but the recording, as Ruppelt states, was 'so hot that it was later destroyed'.

Nevertheless, the Monmouth sightings, combined with the Lubbock sightings, compelled Major General Cabell to order ATIC to establish a new, more serious UFO investigations project. In April, 1952, Project Grudge was renamed Project Blue Book and Captain Edward J. Ruppelt was placed in charge. He was soon faced with the most frightening UFO flap of them all... and with the revelation that the US Government and the Pentagon were not as keen on official UFO investigations as they appeared to be.

In 1952, Washington DC was 'invaded' by UFOs to a degree that had not been duplicated before and has not been since.

By June of that year, the US Air Force's Project Blue Book was going strong under the leadership of Captain Edward J. Ruppelt and had received more official UFO reports than it had done in any previous month in its history. In fact, according to Ruppelt, the sheer number of reports was making Air Force officers in the Pentagon frantic.

By 15 June, the locations, timing, and sequence of the reports indicated that the UFOs were gradually closing in on Washington D.C.

Throughout the afternoon of 15 June, reports of 'round, shiny objects' and 'silvery spheres' came in from all over Virginia, one after the other: 3.40pm at Unionville; 4.20pm at Gordonsville; 4.25pm at Richmond; then 4.43pm and 5.43pm at Gordonsville. At 7.35pm a lot of people in Blackstone, about eighty miles south of Gordonsville, observed a 'round, shiny object with a golden glow' moving from north to south. By 7.59pm the same object was observed by the people in the CAA radio facility at Blackstone. At 8.00pm a jet from Langley Air Force Base tried to intercept it, but five minutes later the object, moving too slowly to be an aeroplane, disappeared.

So inexplicable and disturbing were these reports that Captain Ruppelt was called to Washington to give a briefing in the restricted area of the fourth-floor 'B' ring of the Pentagon to General Samford, the Director of Intelligence, some of the members of his staff, two Navy captains from the Office of Naval Intelligence, and some others whom Ruppelt could not name for security reasons. That meeting resulted in 'a directive to take further steps to obtain positive identification of the UFOs'.

Meanwhile, the sightings continued. By the end of June, it had become apparent that there was a considerable build-up of sightings in the eastern United States. In Massachusetts, New Jersey and Maryland jet fighters were scrambled almost nightly for a week, but always foiled when their radar-locks were broken by the abrupt, swift manoeuvres of the UFOs. On 1 July, many UFOs were sighted over Boston, then began working their way down the coast. The same day, according to Blue Book reports, two UFOs had 'come down across Boston on a southwesterly heading, crossed Long Island, hovered a few minutes over the Army's secret laboratories at Fort Monmouth, then proceeded toward Washington'. A few hours later, the first report from Washngton was submitted by a physics professor at George Washington University.

For the next couple of weeks, reports about Washington sightings poured in at the rate of twenty or thirty a day and, according to Ruppelt, 'unknowns were running about 40 per cent'. Finally, on the night of 19 July, the most highly publicized sightings in UFO history began.

At 11.40pm two radars at Washington National Airport picked up eight unidentified targets near Andrews AFB, Maryland. The objects were flying at approximately 100 mph to 130 mph, then they suddenly accelerated to 'fantastically high speeds' and left the area. They soon returned, en masse. During the night, tower operators and the aircrews of several airliners saw unidentified lights in the same locations indicated by the radar. Before the night was out, and while interceptor jets tried and failed to catch them, the unidentified targets had moved into every sector covered by the radarscopes, including the 'prohibited corridor' over the White House and the Capitol. A colourful climax was reached when, in the early hours of the morning, the operators in the control tower at Andrews AFB, in response to an ARTC traffic controller's query about a target directly over the Andrews Radio range station, located near their tower, reported that a 'large, fiery, orange-

coloured sphere' was hovering in the sky directly above them.

Captain Ruppelt had not been informed of the sightings and only found out about them when he bought a newspaper at the Washington International Airport Terminal Building after a flight from Dayton, Ohio. He rushed immediately to the Pentagon where he had an urgent meeting with ATIC's Pentagon liaison man, Major Dewey Fournet, and Colonel Bower, an intelligence officer from nearby Bolling AFB. They confirmed that throughout the night the restricted corridor around the White House had been filled with interceptor jets trying to chase numerous UFOs, that the UFOs had been radar tracked all around Washington DC, that an analysis of the sightings had completely ruled out temperature inversions, and that the radar operators at Washington National Airport and Andrews AFB - plus at least two veteran airline pilots - had all sworn that their sightings were caused by the radar waves bouncing off solid objects.

On behalf of the Air Force, public relations officer Al Chops gave the press an official 'No comment' on the sightings. In the meantime, Captain Ruppelt tried to set up a thorough investigation, but was blocked whichever way he turned. He planned to go all over the area, to every sighting location, but he hardly got out of the Pentagon.

First, he called the transportation section for a car - and was refused. Next, he went down to the finance office to see if he could *rent* a car - and was refused that as well. Next, he was reminded that he was supposed to be on his way back to Dayton, and that if he didn't leave, he would be technically AWOL.Ruppelt gave up in disgust and returned to Dayton.

However, within a week to the hour of the first major flap, another UFO 'invasion' took place over Washington DC - and this time it was even more impressive.

At approximately 10.30pm on 26 July, the same radar operators who had seen the previous UFOs picked up a lot of 'slowly moving' targets... but this time the UFOs were spread out in a huge arc around Washington - from Herndon, Virginia, to Andrews AFB.

In short, they had Washington boxed in.

By 11.30pm four or five of the targets were being tracked continually over the Capitol. F-94 interceptor jets tried and failed to catch them. Shortly after the UFOs left the sky over the Capitol, UFO reports came in from Langley AFB, near Newport News, Virginia, where the operators described

them as unidentified lights that were ‘rotating and giving off alternating colours’. Another F-94 was despatched from Langley AFB and visually vectored to the lights by the tower operators. The pilot reported that as he approached one of the lights, it went out ‘like somebody turning off a light bulb’. No sooner had this happened, than the targets came back on the radarscopes at Washington National Airport. Again, F-94s were despatched to locate them - but each time they were vectored into the lights, the UFOs disappeared abruptly from the radarscopes and the pilots simultaneously reported that they had visually observed the lights blinking out.

This game of cat and mouse between the UFOs and the interceptor planes continued throughout the night until, just before dawn, the last of the UFOs disappeared from the radarscopes.

Throughout that same night, there was chaos in Washington.The press was furious because all reporters and photographers had been ordered out of the radar rooms at the time the Air Force interceptors were chasing the UFOs. However, once the press had gone, arguments blew up in those radar towers and in the Pentagon. According to Dewey Fournet, ATIC’s Pentagon liaison man, everyone in the radar rooms had been convinced that the targets had been caused by solid, metallic objects and could not have been anything else - and whatever they were, they could literally hover in the air, then abruptly accelerate to thousands of miles per hour.

Soon, a story was circulating the President Truman had personally witnessed UFOs skimming right around the White House. There is no confirmation for such a story, but it is known that about 10.00am the next day, the President’s air aide, Brigadier General Landry, called Intelligence at Truman’s personal request to find out what was going on. Captain Ruppelt was the one who took that call, but he had to hedge his answers, because he could not explain the sightings away.

It was the Washington sightings more than anything else that made the Project Blue Book staff suspicious of the official Air Force stance on UFOs. In fact, Blue Book spent over a year investigating the sightings and some of the team were shaken by what they discovered.

For a start, when the tower operators at Andrews AFB were later interrogated about the ‘large, fiery, orange-coloured sphere’ they had reported seeing right over the Andrews Radio range station, located near their control tower, they completely changed their story and said that what they

had really seen was a star.

Ruppelt found it had to credit that trained radar operators would mistake ‘a large, fiery, orange-coloured sphere’ for a star; he was further disconcerted when he learned that according to astronomical charts there had been no exceptionally bright stars where the UFO was reported to have been seen. Ruppelt then found out, from what he claimed was a reliable source, that the tower operators had been ‘persuaded’ to change their stories.

Likewise, the pilot of an F-94C, who had told Ruppelt about vainly trying to intercept unidentified lights, later stated in his official report that all he had seen was a ground light reflecting off a layer of haze - a patently ridiculous statement, since both the pilot and the radar had confirmed that the lights had repeatedly disappeared and reappeared in the sky before eventually shooting away.

Regarding the Air Force’s continuing insistence that the lights had been caused by temperature inversions, Blue Book checked out the strength of the inversions through the Air Defence Command Weather Forecast Centre - and at no time during that flap was there a temperature inversion strong enough to show up on the radar. Finally, no weather target makes a 180° turn and flies away every time an aeroplane reaches it.

The Washington sightings, according to Project Blue Book, are still unknowns.

While the UFO ‘invasion’ of Washington was unprecedented, it was followed by another series of sightings that would deepen Ruppelt’s concern about what the UFOs were, where they came from, and who knew about them.

A couple of months after the Washington UFO ‘invasion’, at the beginning of September 1952, there was a build-up of UFO sightings from the southeastern United States, notably Georgia and Alabama. A disconcerting number of them were from the vicinity of the new, top-secret Atomic Energy Commission complex at Savannah River; many more were over Brookley Air Force Base near Mobile, Alabama. That same month, the NATO naval forces were holding manoeuvres - known as Operation Mainbrace - off the coast of Europe.

On 20 September, a US newspaper reporter and a group of pilots and flight deck crew on board an aircraft carrier in the North Sea watched a ‘perfectly clear, silvery sphere’ moving across the sky just behind the fleet of ships. The object was large and appeared to be moving rapidly, so the

reporter shot several pictures of it. These were developed straight away and immediately studied by the intelligence officers on board the aircraft carrier. The pictures were excellent and the object shown looked like a large balloon - but no balloons were in the area and a later analysis of all the photographs proved conclusively that the object had been moving very fast.

The following day, six Royal Air Force pilots flying a formation of jet fighters over the North Sea saw a 'shiny, spherical object' coming from the direction of the NATO fleet. They took after it and lost it, but when they neared their base, one of the pilots noticed that the UFO was following them. He turned back towards it, but the UFO also turned away and outdistanced the RAF aeroplane in a matter of minutes.

Finally, on the third day of the NATO exercise, a UFO was observed near the fleet, this time over the Topcliffe Aerodrome on the English mainland. A pilot in a British jet was sent in pursuit and managed to get close enough to describe the object as 'round, silvery and white' and to note that it 'seemed to rotate around its vertical axis and sort of wobble'. When he tried to get closer, the UFO shot off and soon disappeared.

According to what an RAF intelligence officer later told Captain Ruppelt at a Pentagon meeting, it was the Operation Mainbrace sightings that finally forced the RAF to officially recognise the UFO phenomenon. Though this was later denied by the RAF, Captain Ruppelt had other reasons to be particularly intrigued, and disturbed, by events that related the Washington UFO invasion to the Mainbrace sightings in his thoughts.

In *The Report on Unidentified Flying Objects*, Ruppelt reveals that prior to the famous UFO invasion of Washington on 20 and 27 July 1952, a scientist from an agency he could not name for security reasons told him with conviction: 'Within the next few days... you're going to have the granddaddy of all UFO sightings. The sightings will occur in Washington or New York - probably Washington.' Ruppelt also reports that in September of 1952, when the NATO naval forces were about to commence Operation Mainbrace, someone in the Pentagon mentioned that Naval Intelligence should keep an eye out for UFOs - which were subsequently observed by many involved in the operation. .

In other words, there were those in the White House and the Pentagon who seemed to have prior knowledge of when and where certain UFOs were going to appear. This led to the belief, widely suppressed at the time, that the

US had its own flying saucers.

Chapter 7

The Man-Made Flying Saucers

US Intelligence concern that the flying saucers might be highly advanced, long-range, jet fighter or reconnaissance planes constructed in secret by the Soviets began with the Scandinavian ‘ghost rockets’ of 1947 and grew in the following years. This can be seen in a formerly classified Memorandum for Record dated 29 April 29 1952, requesting information on Soviet ‘manned aircraft of unconventional design, orbital missile (including the Sanger global range bombing system) and orbital bombing platforms, and flying saucers’. This concern would only have been heightened by the reported crash of a flying saucer with Russian insignia at Spitzbergen, Norway, on 8 August the same year.

US Intelligence was aware of the fact that a patent for a ‘flying saucer with a circular fixed wing’ had been taken out by an American citizen (unnamed) as early as 22 March 1932.

The unnamed citizen was probably Jonathan E. Caldwell. This would explain why, on 19 August 1949, at the height of the immediate post-war UFO flap, the Air Force Command of Baltimore called a press conference to announce that two different types of prototypes which might solve the mystery of the flying saucers had been found in an abandoned farm near Glen Burnie, Maryland. According to the Air Force spokesman, both machines had been designed and constructed before the war by one Jonathan E. Caldwell, with the aid of a local mechanic, and one of the machines had actually been flown.

The machines had been abandoned for years and were falling apart, but as they were a combination of aeroplane and helicopter, with round wings and contrarotating propellers, it was the belief of Air Force intelligence that in flight they would have resembled flying saucers and therefore could have been the prototypes of the more advanced UFOs seen in the skies over the past few years.

This notion was quickly squashed when, less than twenty-four hours later, at another urgent press conference, a different Air Force spokesman

announced that the Caldwell machines had ‘absolutely no connection with the reported phenomena of flying saucers’. What the Air Force spokesman did not mention is that Caldwell had constructed his ‘plane with circular wing of the “parasol” type’ (it was raised above the fuselage, like an umbrella) in 1932 and it was tested the following year by Professor J. Owen Evans in a wind tunnel in Los Angeles, then flown by the well known pilot, Jimmy Doolittle, displaying a top speed of 97 mph and a landing speed of 23 mph. In 1936, Caldwell produced a modified version of the prototype, but it crashed, killing the pilot, thus putting Caldwell out of business for good. When he left Glen Burnie, in 1940, he bitterly informed Professor Evans that only the lack of another $5000 had stood between him and ‘an astonishing result’.

Nevertheless, US military Intelligence continued to be anxious about the possibility of man-made flying saucers, and was further concerned because most of the saucer sightings in the US ‘tend to cluster around key development stations such as atomic plants, guided missile areas, and Wright-Patterson Air Force Base’. It is clear, then, from these suspicions and other remarks sprinkled liberally throughout the now declassified intelligence documents of the period, that US intelligence findings ‘seem to exclude extraterrestrial origin of the saucers’.

If on the one hand they were concerned with Soviet advancement in this field, they soon began suspecting that the saucers might be of US or Canadian origin. Regarding the former, as the US Navy, Army and Air Force were in constant competition with one-another, each would have been loath to inform the other of any secret projects in the pipeline. Thus, even at the top-secret White Sands Proving Ground, used extensively by the US Navy for their aeronautical and missile experiments, there were research projects that even the CIA could not learn about and, given Navy interest in vertical-ascending aircraft, they could have included saucer-shaped aircraft.

The first rumblings about Canadian flying saucer projects were made in a classified CIA memorandum dated 18 August 1953 - a year after the Spitzbergen flying saucer crash report. The CIA memorandum states: ‘According to recent reports from Toronto, a number of Canadian Air Force engineers are engaged in the construction of a “flying saucer” to be used as a future weapon of war. The work of these engineers is being carried out in great secrecy at the A.V. Roe Company factories.’

This report was correct - as were the widespread suspicions that the US

Navy was conducting experiments on saucer-shaped, vertical-rising aircraft in secret hangars in the vast White Sands Proving Ground.
One belief widespread in Intelligence circles was that the formation of the lights in the famous Lubbock sightings and others were not indicative of small glowing saucers, but of the many exhaust jets along the edge of a massive 'boomerang-shaped' aircraft, or advanced 'flying wing', which would, when viewed from certain angles, strongly resemble a flying saucer, or saucers. This belief went all the way back to the immediate post-war years, as can be gauged from a once secret, now declassified Department of the Army intelligence memorandum, dated 21 January 1948 and circulated to the intelligence chiefs of the US, Canada, and Europe.

In this document concern is expressed that 'the German High Command indicated a definite interest in the Horten type of flying wing and were about to embark on a rigorous campaign to develop such aircraft toward the end of the war'. After clarifying that these aircraft were the IX, or Go-8-229 and Go-P-60 night-fighter planes being produced at the Gotha (Erfurt) plant, the memorandum continues:

> This plant is now in the hands of the Russians. A recent report indicates that the Russians are now planning to build a fleet of 1800 Horten VIII (six engine pusher) type flying wing aircraft. The wing span is 131 feet. The swept back angle is 30°. The Russian version is reported to be jet-propelled.

Included in this secret memorandum was a request for information on various technical matters relating to 'aircraft whose shape approximates that of an oval, disk, or saucer', including 'boundary layer control method by suction, blowing, or a combination of both' and 'special controls for effective manoeuvrability at very slow speeds or extremely high altitudes'.

The CIA were already holding copies of the lengthy paper presented by the Horten brothers at the Flying Wing Seminar in Bonn, Germany, on 14 April 1943, in which they confirmed that 'a sweptback wing without protrusions is suited to warding off cable barriers, balloon barrages etc... the sweptback wing has advantages at high Mach numbers' and 'sweepback becomes necessary for high-speed flight'. The writer of the Army intelligence memorandum, Colonel R.F. Ennis, GSC Chief, Intelligence Group, therefore

also requested information on the ‘present activities’ of the Horten brothers, Walter and Rismer.

The fact that the Horten papers found in CIA files had not come from Germany, but from the Chance-Vought Aircraft Company, a division of United Aircraft Company, Stratford, Connecticut, is of particular interest as this company would soon be embroiled in the US man-made flying saucer controversy.

The correlation between flying ‘wings’ and flying ‘saucers’ is a logical outcome of the aeronautical development of that period. Renato Vesco quotes Charles Gardner, then considered Britain’s best aviation editor, as saying:

> There is no doubt that the problem in passing through the ‘sound barrier’ will force us to make considerable modifications in the shapes of our flying machines... In order to overcome such difficulties many scientists have suggested a ‘delta’-shaped wing or a right-angled triangle... without tail or fuselage... From the ‘delta’ to the semicircle and from this to the full circle are two clearly connected steps...

Various ‘delta’-wing, semicircular, or ‘boomerang’ shapes were introduced shortly after World War II in the shape of such aircraft as the Armstrong Whitworth AW-52-G Bat - a ‘twin-engined, all-wing jet’ - and did indeed evolve into contemporary ‘right-angled triangle’ ultra-speed jet aircraft, such as the deadly Stealth night-fighter jets. What is not yet known is just how much has been done behind closed doors about the ‘connected steps’ from these semicircular, boomerang and triangular aircraft to the ‘full circle’ aircraft, or flying saucer.

We now know that such steps were certainly well under way in various top-secret establishments, first in World War II Germany, possibly then in the Soviet Union, and certainly in Canada and the US.

Evidence for US involvement with disk-shaped aircraft projects surfaced with information about the US Navy’s Flying Flapjack, or Flying Pancake. Designed by Charles H. Zimmerman of the National Advisory Committee for Aeronautics and constructed in 1942 by the Chance-Vought Corporation,

mentioned above, the Flying Flapjack, or V-173, was an experimental, vertical-rising, disk-shaped aircraft, a combination of helicopter and jet plane, powered by two 80hp engines and driven by twin propellers, with two fins (stabilizers) on either side of its semi-circular, or pan-cake-shaped, configuration. Reportedly it had a maximum speed of 400 mph to 500 mph, could rise almost vertically, and could practically hover at 35 mph.

A later, more advanced model, the XF-5-U-1, utilised two Pratt and Whitney R-2000-7 engines of 1,600hp each and was reported to be about 105 feet (30 metres) in diameter and have jet nozzles - resembling the 'glowing windows' seen on so many UFOs - arranged around its outer rim, just below the centre of gravity. It was built in three layers, the central layer being slightly larger than the other two. Since the saucer's velocity and manoeuvring abilities were controlled by the power and tilt of the variable-direction jet nozzles, there were no ailerons, rudders or other protruding surfaces. The material used was a metal alloy that had 'a dull, whitish' colour.

In short, a machine remarkably similar in appearance to those reported by so many UFO witnesses.

Information about the Flying Flapjack was released to the public in the April 1950 edition of the *US News and World Report* and it touched off some interesting speculations. The first of these arose from the retrospective knowledge that the US Navy had always expressed more interest in a vertical-rising aeroplane than the Air Force; they had, up to 1950, spent *twice* as much money as the Air Force on secret guided missile research; their top-secret missile-research bases were located in the White Sands Proving Ground - where the majority of military UFO sightings had occurred - and because they were not involved officially in UFO investigations, they could conduct their own research in a secrecy unruffled by the attentions of the media or the public.

According to the Project Grudge report for 1947, the UFO viewed over Muroc AFB on 7 and 8 July of that year was 'an oscillating object which flew *slowly* (author's emphasis) and had tactics unlike an ordinary aeroplane'. Some witnesses, all trained Air Force personnel, observed two disks at an altitude of about 8,000 feet, both manoeuvring in 'tight circles with varying speeds' and oscillating. Also, just like the XF-5-U-1, both disks had two fins on the upper surface.

Another interesting point is that the measurements taken by Navy commander R.B. McLaughlin and his team of Navy scientists of the UFO they had tracked over the White Sands Proving Ground in 1949 (two years after the Muroc sightings) corresponded closely, except for the speed, with the details of the original XF-5-U-1. It is also worth noting that initial reports of the extraordinarily high speeds recorded by McLaughlin turned out to be inaccurate and that later analysis of the data brought the speed much closer to that of an advanced jet plane or the original expectations for the Flapjack.

The *US News and World Report* also pointed out that the Air Force had called off official inquiry into the UFO phenomenon the previous December, even in 'the face of overwhelming evidence that the saucers are real'. This was seen by many as a clear indication that top Air Force officials now knew what the saucers are and where they came from. Therefore, while still denying that the Air Force was involved, they were no longer concerned about the saucers.

The article concludes: 'Surface indications, then, point to research centres of the US Navy's vast guided-missile project as the scene of present flying-saucer development.'

The production prototype of the Flapjack was due for a test-flight at Muroc AFB (now Edwards AFB) in 1947 - when the first 'flying saucer' sightings over that same base and at Rogers Dry Lake (then adjacent to Muroc, now part of Edwards AFB) were recorded. Whether such test flights were actually carried out has never been confirmed or denied by the US Navy. The only official statements given were to the effect that work on the Flying Flapjack had ceased the following year.

In an article published in the April 1950 issue of *Saucer News*, Dr Leon Davidson, then a chemical engineer at the Los Alamos Scientific Laboratory, claims that LCDR Picket Lumpkin, US Navy, told him that 'it became apparent that the desired speed characteristics could be attained with less difficulty in a jet-powered aircraft'. Whatever the reasons, LCDR F.M. Lloyd, also of the US Navy, informed Davidson that the project had been dropped officially on 12 March 1948.

The first version, the V-173, is stored with the Smithsonian Institution...But US involvement with saucer-shaped aircraft did not end with this prototype.

It is worth recalling that in the reports that started the modern UFO scare - the Harold Dahl and Kenneth Arnold sightings of June 1947 - both men observed the UFOs in the vicinity of Mount Rainier in the Cascades in the state of Washington - which divides Oregon and Canada - and both stated independently that the UFOs flew away in the direction of the Canadian border. During the first week in July there were numerous reports of unidentified 'luminous bodies' in the skies over the Province of Quebec, Oregon and New England. The next major UFO flap was the 'invasion' of Washington DC in 1952; and while the official flap started on 19 July, there was a record, dated 17 June, of several hundred unidentified 'red spheres' that flew at supersonic speeds over the Canadian Air Base of North Bay in Ontario and then crossed over some of the south-eastern states. Finally, nearly all of the subsequent Washington DC UFOs were reported as flying away in a southerly direction; when they returned, en masse, on 26 July, their disappearance in a general southerly direction - toward the Canadian border - also applied.

It is, therefore, a matter of considerable interest that on 11 February 1953, the Toronto *Star* reported that a new flying saucer was being developed at the AVRO-Canada plant in Malton, Ontario.

The US and Canadian governments both denied involvement in any such project, but on 16 February, after freelance photographer Jack Judges had taken an aerial photograph of a flying-saucer resting outdoors in the Avro-Canada plant in Malton, the Minister for Defence Production, C.D. Howe, admitted to the Canadian House of Commons that AVRO-Canada was working on a 'mock-up model' of a flying saucer, capable of ascending vertically and flying at 1500 mph (2400 km/h). By February 27, Crawford Gordon Jr., the president of AVRO-Canada, was writing in the company's house journal, *AVRO News*, that the prototype being built was so revolutionary it would 'make all other forms of supersonic aircraft obsolete'. The aircraft was called the 'Avrocar'.

Soon, the Toronto *Star* was claiming that Britain's Field Marshal Montgomery had become one of the few people to view Avro's mock-up of the flying saucer (Georg Klein started telling the same story in 1954 in Zürich, Switzerland, though who picked it up from whom it a moot question) and a few days later Air Vice Marshal D. M. Smith was reported to have said that what Field Marshal Montgomery had seen was the preliminary

construction plans for a ‘gyroscopic fighter whose gas turbine would revolve around the pilot, who would be positioned at the centre of the disk’.

Confirmation that the craft actually existed came via the April 1953 issue of the *Royal Air Force Flying Review* which contained a two-page report on the Avrocar (also dubbed the ‘Omega’), including some speculative sectional diagrams. According to this report, the building of a prototype had not yet commenced, but a wooden mock-up had been constructed behind a closely guarded experimental hangar in the company’s Malton plant, near Ontario. The aircraft described had a near-circular shape, measuring approximately forty feet across, and was being designed to attain speeds of the order of 1,500 mph - more than twice that of the latest swept-wing fighters. It would be capable of effecting 180° turns in flight without changing attitude.

In early November 1953, Canadian newspapers were reporting that a mock-up of the Avrocar, or Omega, had been shown on 31 October to a group of twenty-five American military officers and scientists. By March the following year, the American press was claiming that the US Air Force, concerned at Soviet progress in aeronautics, had allocated an unspecified sum of money to the Canadian government for the building of a prototype of their flying saucer, that the machine had been designed by the English aeronautical engineer, John Frost - who had worked for AVRO-Canada in Malton, Ontario - and that it would be capable of either hovering virtually motionless in mid-air or flying at a speed of nearly 2,000 mph.

This story was followed by Canadian press assertions that their government was planning to form entire squadrons of AVRO-Canada’s flying saucers for the defence of Alaska and the far regions of the North because they required no runways, were capable of rising vertically, and were ideal for ‘subarctic and polar regions’.

Unexpected disappointment came when, on 3 December 1954, it was announced that the ‘saucer project’ had been dropped. Confirming this decision, the Canadian Minister of Defence pointed out that the project would have cost far too much for something that was, in the end, ‘highly speculative’.

However, this announcement was contradicted less than a year later, when, on 22 October 1955, US Air Force Secretary Donald Quarles released an extraordinary statement though the press office of the Department of Defence. Among other things, he said that an ‘aircraft of unusual

characteristics' would soon be appearing; that the US government had 'initiated negotiations' with the Canadian government and AVRO-Canada for the preparation of 'an experimental model of the Frost flying disk', and that the aircraft would be mass-produced and used for 'the common defence of the sub-arctic area of the continent'.

In February 1959, after a long silence, the press was receiving ambiguous US Air Force statements about a revolutionary new aircraft that had been undertaken jointly by the US Air Force, the US Army, and the Canadian government. Then, on 14 April, during a press conference in Washington DC, General Frank Britten implied that the first test flight of the aircraft was imminent and that it was destined to 'revolutionize traditional aeronautical concepts'.

In August 1960 the Air Force, giving in to public pressure, allowed reporters to view the prototype of the machine that had so fascinated them and their readers. What the news hounds were shown was a crude experimental aircraft that combined the characteristics of air-cushion machines - a crude flying saucer based on the principles of the jet ring and barely able to rise above the runway. Small wonder, seeing this, that they did not appear unduly surprised when, in December the following year, the Department of Defence announced that they were withdrawing from participation in the project.

So what, exactly, was the Avrocar, which may, or may not, have been what the reporters saw in August 1960? In the words of the *Royal Air Force Flying Review*:

> Apart from the platform of this aircraft, the most revolutionary feature of the project is the use made of the gyroscopic effect of a revolving power plant to acquire stability. The power plant housing rotates inside a stationary wing of near-circular platform whereas hitherto it had been assumed that such an aircraft would employ a swiftly rotating wing. The pilot of the saucer is seated in a central plastic capsule, which presumably can be ejected should the aircraft find itself in difficulties, and a gas turbine power plant of unconventional design revolves around this capsule at several hundred revolutions per minute. Surrounding the rotating power plant housing and forming the 'rim' of the saucer is the stationary wing, a series of

> slots in the leading edge which feed air to the turbine. Part of the intake of air is compressed and fed to combustion chambers in the wing and ejected through a series of exhaust orifices lining the outer rim of the disk. The remainder of the airflow appears to be fed over a series of vertical deflector vanes in the 'flattened' trailing edge of the aircraft for control purposes. A tripod-type launching gear is planned to enable the saucer to take off vertically.

The writer was careful to point out that:

> Although quite a number of aircraft featuring circular, disk-shaped or annular wing forms have been built and flown, the aerodynamics of such shapes cannot yet be considered as fully established, and the design problems facing the young Avro Canada design team in bringing this revolutionary project to fruition are of considerable magnitude.

This may have been true. Details released later by the A.V. Roe Company (AVRO-Canada) stated that the Avrocar, powered by three 1,000-hp Continental J69-T-9 turbojets, was planned to have a maximum forward speed of 300 mph and a range of 1,000 miles; but when test flown in 1960, it never did more than 'hover within ground effect' and was subsequently abandoned as a failure.

The prototype was placed on display for all to see at the Army Transportation Museum at Fort Eustis, Virginia.

In 1954 the Canadian Government announced that the 'flying wing' or 'highly swept-back wing configuration' controlled by a series of small jet orifices located all around its edge, as suggested by the Lubbock sightings of 1951, was exactly the kind of thing they had tried unsuccessfully to build. According to the statement, the project for the development of that 'saucer-like craft' had been taken over by the US Air Force.

Under pressure from the media to reply to this allegation, the US Air Force finally admitted that they had taken over the project, but insisted that it had been dropped at an early stage and that the crude prototype on display at Fort Eustis, Virginia, is the only one they managed to complete.

However, while the Canadian and US governments have insisted that they are no longer involved with flying saucer construction projects, there are many who believe that they are lying, and that the Canadian, British, US and even Soviet governments are continuing to work on highly advanced, saucer-shaped, supersonic aircraft based on the work done in Nazi Germany. What happened to the original Projekt Saucer team supports this: Habermohl was captured by the Russians and taken back to the Soviet Union, along with over 6000 German technical specialists of all kinds, to work on similar projects; Miethe went to the United States with Werner von Braun and other German rocket scientists and ended up working for Avro-Canada, in Malton, Ontario; and Rudolph Schriever insisted right up to his death that the Soviet Union and United States were both working on flying saucer construction projects based on material captured by them during the war.

In fact, the April 1953 edition of the *Royal Air Force Flying Review* stated that it was 'common knowledge' that aircraft designers throughout the world were then devoting increasing attention to 'flying saucers' when considering flying speeds of more than twice that of sound. It also contained a short report about man-made flying saucers that had recently skimmed over the rooftops of Belgrade, Yugoslavia. Reportedly, these were experimental models made by the Yugoslavian Air Force; they were less than twelve inches in diameter, weighed just over 4lb, had a top speed of 31 mph, and were controlled by radio - crude versions of the German *Feuerball*.

It seems clear, therefore, that work on 'circular flying wings' of various shapes and sizes was going on in America and Canada - and may have been going on elsewhere, notably in Soviet Russia. Also, there is a growing body of evidence that the Pentagon knew what the flying saucers were and where they came from, despite the lack of communication between the US Air Force and US Navy. Dr Leon Davidson points out that interservice rivalry between the two was intense and that the former would not have informed the latter about their secret aviation developments, such as the Flying Flapjack, even after the experimental models had been sighted over The White Sands Proving Ground.

Captain Ruppelt, when head of Project Blue Book, was adamant that, at least with regard to the United States, UFOs were spotted most frequently, by trained observers, over areas vital to the defence of the country. In his own words: 'The Los Alamos-Albuquerque area, Oak Ridge, and White Sands

Proving Ground rated high. Port areas, Strategic Air Command bases, and industrial areas ranked next.'

This concentration of UFOs over top-secret military establishments in particular leads to one of two conclusions. The first is that the Russians or Canadians were using flying saucers to spy on US military establishments. The second is that US flying saucers were being constructed in, and tested over, top-secret areas such as the White Sands Proving Ground.

Chapter 8

-

UFO Landings and UFOnauts

Perhaps the world's best known and most respected UFOlogist is the astronomer, Dr J. Allen Hynek, whose involvement began in 1948 when he became the astronomical consultant to the United States Air Force (USAF) on their UFO research project. After the termination of Project Blue Book, Hynek became critical of the Air Force's methods and conclusions. In 1973 he became the Founder and Director of the Center for UFO Studies (CUFOS) and since then he has been a fulltime UFOlogist.

While Hynek adheres to no particular theory regarding the nature of UFOs, he believes firmly in the reality of the phenomenon and that the solution to the mystery could lead to a 'quantum jump' in human understanding. He is the author of two of the most reliable books on the subject: *The UFO Experience: A Scientific Inquiry* (1972) and *The Hynek UFO Report* (1978). However, he first became publicly well known in 1977 through the release of Steven Spielberg's blockbusting UFO movie, *Close Encounters of the Third Kind*, for which he was the technical advisor.

The title of the movie was taken from one of the four terms coined by Hynek to describe the major forms of UFO contact: Close Encounters of the First Kind (CE-I), which are UFO sightings at close range without tangible physical evidence; Close Encounters of the Second Kind (CE-II), which are UFO sightings at close range accompanied by tangible physical evidence; Close Encounters of the Third Kind (CE-III), which are close range sightings of UFOs and one or more UFOnauts (UFO crew members); and Close Encounters of the Fourth Kind (CE-IV), which are the abductions of human beings by UFOnauts.

The question of contact with UFOs or their occupants is a vexing one, particularly since the earliest reported close encounters were undoubtedly hoaxes and even the more persuasive cases can seem fantastic. The incident that set the pattern for most contemporary hoaxes, as well as the basic appearance of the 'alien' UFOnauts, was the notorious 'Aztec' case of 1948. In *Behind the Flying Saucers* (1950), the author, Frank Scully, formerly

Hollywood's *Weekly Variety* columnist, alleged that 'the first saucer to land on this earth' crashed east of Aztec, New Mexico, in 1948, and was found virtually intact, with sixteen dead aliens, or UFOnauts, inside. The UFOnauts were only three-and-a-half feet tall and had 'flawless teeth' and unusually pointed features, but otherwise resembled human beings. According to Scully, the flying saucer, which was 99 feet in diameter (with all of its measurements reportedly based on a system of nines, rather than tens), was dismantled and the pieces, along with the remains of the sixteen aliens, were transported in secret to Muroc Dry Lake (now Edwards AFB), then on to the legendary top-secret 'Hangar 18' in Wright-Patterson AFB in Dayton, Ohio. Scully also alleged that there had been three other flying saucer landings during the same period and that a total of thirty-four dead aliens had been found and were also being preserved at Wright-Patterson.

Scully's book became a bestseller, but little substantiation could be found for his claims. Two years later, the investigative reporter, J.P. Cahn, revealed that Scully had received most of his dubious information from Silas Newton and Dr Gee, later identified as Leo A. Gebauer. In fact, both men were experienced confidence tricksters who had been arrested that very year for trying to sell worthless war surplus equipment as oil detection devices; and it is highly probable that they based their whole story on the better documented 'Roswell Incident', discussed below.

Nevertheless, Cahn's exposé of the Aztec case as a hoax did not stop the continuing flow of UFO 'crash' stories and rumours that alien corpses - at least those captured in the United States - were being preserved in Hangar 18 in Wright-Patterson AFB, Dayton, Ohio. As late as 1978, the UFOlogist and author, Leonard Springfield, was claiming that he had reports from 'twenty-five unimpeachable sources' that 'spaceships and frozen alien corpses' were being held at Wright-Patterson. A year later, William Spaulding, aerospace engineer and Western Division Director of the widely respected and scientifically-based organization, Ground Saucer Watch (GSW), was claiming that he was in possession of signed affidavits from 'retired colonels in military intelligence' attesting to the fact that a crashed disk and alien entity had been retrieved and transported to CIA headquarters at Langley, Virginia, from which it would, according to legend, have been shipped on to Wright-Patterson for examination and preservation in Hangar 18.

All requests to Wright-Patterson AFB for information regarding Hangar

18 are routinely given the reply that it doesn't exist. However, according to news commentator and reporter, Robert D. Barry, quoted in Timothy Green Beckley's *The Riddle of Hangar 18* (1981), one of his interviewees, a Civil Air Patrol Cadet on special training at Wight-Patterson in 1965, saw 'the famous hangar with the tall wire fence around it... completely around it... and all windows knocked out and replaced with concrete'. Also, on 24 October 1974, the syndicated news broadcast 'Earth News' revealed that a 'press spokesperson' for Senator Barry M. Goldwater had confirmed that 'the senator was once denied permission to the Wright-Patterson Air Force Base's Hangar 18. (Goldwater, a former Republican presidential candidate who took the UFO phenomenon seriously, eventually became a member of the Board of Governors of the National Investigations Committee on Aerial Phenomena [NICAP]).

While no more evidence for the existence of Hangar 18 and its extraordinary contents has been forthcoming (interested readers could try asking Wright-Patterson AFB for information on Building 18-A, Area B), further 'respectability' for the UFO-landing theory came with Gordon Cooper, the astronaut who claimed that he had seen a UFO while orbiting Earth in the Mercury 9 spacecraft on 16 May 1963. Later, as a guest on the *Merv Griffith Show*, Cooper boldly announced that in the early 1950s, while in a jet fighter group in West Germany, he had been one of many witnesses to a series of unidentified objects that 'would stop in their forward velocity and change 90°, sometimes in the middle of their flight path'. Later, Cooper told journalist Lee Spiegel that while at the Edwards Air Force Base Flight Test Center in California, either in 1957 or 1958, a team of photographers assigned by him to photograph the vast dry lakes near Edwards 'spotted a strange-looking craft above the lake bed'. The object was 'hovering above the ground. Then it slowly came down and sat on the lake bed for a few minutes'. It was 'at least the size of a vehicle that would carry normal-sized people in it' and was also 'a typical circular-shaped UFO' which 'took off at quite a sharp angle and just climbed straight out of sight'. In Cooper's words: 'There were always strange things flying around in the air over Edwards.' According to Cooper, the film of the UFO taken by his photographers was forwarded to Washington D.C. for evaluation -but no report came back and the movie has certainly not resurfaced.

Other 'landing' and 'crash' stories abound, but are similarly lacking in

substantiating details or verifiable names. For instance, in *The Riddle of Hangar 18*, author Timothy Green Beckley relates a story about Charles Wilhelm, executive director of the Ohio UFO Investigators League who, according to Beckley, claimed to have 'recently conversed with a radio electronics expert who was in the army in the mid-1950s and said that he was flown to Fort Monmouth, New Jersey' where, in the company of 'nine others, plus a major who was setting up the projector', the 'electronics expert' watched 'a special film' in order to 'analyze from the film anything that he could define from his experience in radar technology'. The film showed 'a strange, disk-shaped object with two guards, one on each side of the craft. The ship was sitting on two large blocks, and the technician estimated the craft to be fifteen to eighteen feet in diameter. Its surface was smooth, except for some tool marks around the door entrance. A ramp extended to the ground. The UFO was either silver or light grey in colour.' After showing the interior of the craft, which was relatively bare, except for some control levers, the camera was moved back outside where it focused on 'a table with three small bodies laid out'. All were approximately five feet tall, with abnormally large heads and human features. When the movie was over, 'the major' in charge would only say that the craft and its occupants had been found in 'New Mexico'.

This is an intriguing tale, but like so many other 'landing' or 'crash' stories it raises more questions than it answers. When was 'recently'? Who, exactly, was the 'electronics expert'? Who was 'the major'? Who were the 'nine others'? Precisely where and when in New Mexico was the object found? And last but not least, how could the unnamed 'electronics expert' possibly apply his 'experience in radar technology' to his viewing of a movie film of the supposed exterior and interior of a flying disk?

The mixture of unsubstantiated facts and disguised speculation is one of the major obstacles in any examination of the 'landing' or 'crash' UFO stories. Nevertheless, there is a growing body of evidence that some close encounters are genuine, as are certain rare cases of UFO landings or crashes, or even the capture of UFO and their occupants.

Dr J. Allen Hynek claims that genuine UFO landings took place at Cannon Air Force Base, New Mexico (18 May 1954), at Deerwood Nike Base (29 September 1957), and at Blaine Air Force Base (12 June 1965). However, even Hynek can only offer unnamed 'independent sources' for

such reports and makes it clear that none of them were transmitted to Project Blue Book.

According to articles written by journalists David Branch and Robert E. Klinn and published in the *Santa Ana Register* (California), on 15 and 23 November 1972, reports of the landing and take-off of two UFOs from Holloman AFB, located in the White Sands Proving Ground, New Mexico, were suppressed by the authorities. The first of these incidents reportedly took place shortly before 8.00am. on an unspecified day in September, 1956, when a 'domed, disk-shaped' aircraft landed about fifty yards from US 70, about twelve miles west of Holloman AFB. The ignition systems and radios of passing cars went dead and the peak-hour commuter traffic backed up as amazed witnesses - including two air force colonels, two sergeants, and dozens of Holloman employees - watched the UFO for over ten minutes, before it took off with a 'low whirring sound'.

Shortly after the disappearance of the UFO, word of the sighting flew from Holloman to Washington DC and the area was soon inundated with air force intelligence officers and CIA agents. Base employees who had witnessed the sighting were sworn to secrecy and the Pentagon's evaluation team wired a report stating that the UFO was 'not any type of aircraft under development by the US or any foreign terrestrial power'.

Two years later, in the summer of 1958, a mechanic at Holloman AFB was working on a grounded Lockheed F-104 jet interceptor when he saw a disk-shaped object hovering silently over the tarmac. After watching the object retracting its 'ball-like landing gear', he called another mechanic and both of them watched the UFO take off vertically at great speed. During a subsequent interrogation, both men identified the craft type they had seen from a book of over 300 UFO photographs. They were then informed that the personnel in the base control tower had observed the same object for two or three minutes. They were also warned not to discuss the incident and then made to sign a statement swearing them to secrecy.

The most striking feature of the landed and crashed UFO stories is that the most substantiated ones invariably have taken place, at least with regard to the US, on or near military and Air Force establishments in the top-secret White Sands Proving Ground. The UFO 'crash' at Roswell, New Mexico, was just such a case; the famous UFO 'landing' at Socorro, New Mexico, was another, even more disturbing, example.

The so-called ‘Roswell Incident’ was the first in which an official statement about a flying saucer landing was released to the public. According to Charles Berlitz and William Moore, who researched the case for their book, *The Roswell Incident* (1980), there was a considerable build-up of UFO sightings in the south-western area before the actual Roswell incident. 25 June 1947: a saucer-shaped object ‘about one half the size of the full moon’ was observed by a local dentist as it moved south over Silver City, New Mexico. 27 June: a disk-shaped object was witnessed in the vicinity of Bisbee, in south-eastern Arizona, near the New Mexican border; and a series of eight or nine ‘perfectly spaced disks’ traveling at high speed with ‘a wobbling motion’ were observed passing over Warren, Arizona. By 9.50 that morning, a ‘white disk glowing like an electric light bulb’ was observed as it passed over Pope, New Mexico. Minutes later, the same, or a similar, object was spotted over the White Sands Proving Ground by Captain E.B. Detchmendy, who reported it to his commanding officer. At 10.00am. a female witness reported a similar object passing over San Miguel, New Mexico. The following day, Captain F. Dvyn, when flying in the vicinity of Alamogordo, New Mexico, in the White Sands Proving Ground, reported ‘a ball of fire with a fiery blue trail behind’ as it passed *beneath* his aircraft. The next day, Army Air Force pilots were sent on an unsuccessful search for a UFO reported to have fallen near Cliff, New Mexico. That same day, a team of naval rocket-test experts working at the White Sands Proving Ground reported seeing a ‘silvery-coloured disk’ perform a series of manoeuvres at high altitude over the secret test range. Thirteen silver, disk-shaped objects were then witnessed by a whole neighbourhood as they flew over Albuquerque, New Mexico, on 30 June; a ‘bluish disk’ was seen ‘zigzagging’ across the sky over Albuquerque on 1 July; and on 2 July, at approximately 9.50pm, a married couple, Mr and Mrs Dan Wilmot, witnessed ‘a large, glowing object’ as it passed over their house in South Penn Street, Roswell, New Mexico.

This latter sighting marked the true beginning of the Roswell Incident.

Dan Wilmot and his wife later described the UFO as ‘a big glowing object’ that was shaped ‘like two inverted saucers faced mouth to mouth’ and glowing ‘as if lit from the inside’. Though Wilmot described the object as being perfectly silent, his wife thought she had heard a ‘slight swishing

sound' for a brief moment, as the object passed overhead. It was heading northwest, towards Corona, New Mexico, and passed over their house and out of sight in forty to fifty seconds.

Nearly a week later, on 7 July, at 4.00pm, Lydia Sleepy, the teletype operator for Radio KOAT, Albuquerque, New Mexico, received a call from Johnny McBoyle, reporter and part owner of sister station, KSWS, in Roswell. Clearly excited, he told her that a flying saucer had recently crashed near Roswell, that he had been out there and seen it, and that it looked like 'a big, crumpled dishpan'. According to McBoyle, 'some rancher' (W.W. Brazel) had 'hauled it under a cattle shelter with his tractor' and the army had since gone out there to pick up the object and seal off the whole area.

McBoyle asked Sleepy to get his message out on the teletype right away, but when she tried to do so, she was blocked by the incoming message of an unidentified sender: 'ATTENTION ALBUQUERQUE: DO NOT TRANSMIT. REPEAT DO NOT TRANSMIT THIS MESSAGE. STOP COMMUNICATION IMMEDIATELY. When Sleepy relayed this message to McBoyle, he changed his mind about transmitting the news of the UFO crash, said that obviously they were not supposed to know about it, and told her to forget what she had heard.

This attempt to comply with the authorities was rendered redundant when, the following day, without the authorization of his commanding officer, Lieutenant Walter G. Haut, public information officer of the Roswell Army Air Base (now Walker Air Force Base) released the following press statement:

> The many rumours regarding the flying disk became a reality yesterday when the intelligence office of the 509th Bomb Group of the Eighth Air Force, Roswell Army Air Field, was fortunate enough to gain possession of a disk through the co-operation of one of the local ranchers and the Sheriff's office of Chaves County.
>
> The flying object landed on a ranch near Roswell sometime last week. Not having phone facilities, the rancher stored the disk until such time as he was able to contact the Sheriff's office, who [*sic*] in turn notified Major Jesse A. Marcel, of the 509th Bomb Group Intelligence office.
>
> Action was immediately taken and the disk was picked up at the

rancher's home. It was inspected at the Roswell Army Air Field and subsequently loaned by Major Marcel to higher headquarters.

Lieutenant Haut would soon have cause to regret his hasty public announcement. While his press release was being enthusiastically picked up by the world's news agencies, the Roswell *Daily Record* of 8 July was confirming that the Intelligence Office of the 509th Bombardment group at Roswell Army Air Field had come into possession of the crashed saucer; that according to information released by the department, the disk had been recovered on a ranch in the 'Roswell vicinity' after an 'unidentified rancher' had notified Sheriff George Wilcox that he had found the crashed object on his land; that intelligence officer Major Jesse. A. Marcel had led the official recovery team and, after inspecting it, had arranged for it to be flown by aircraft to 'higher headquarters'; and that no details of the saucer's construction had been revealed.

By this time, Johnny McBoyle of Radio KSWS in Roswell had informed Lydia Sleepy of Radio KOAT in Albuquerque that he had seen an aeroplane, which he knew was destined for Wright Field (now Wright-Patterson AFB) in Dayton, Ohio, take off with the object, or parts of it, on board. However, he had not been able to get near the aeroplane because it was surrounded by heavily armed guards.

Another article in that day's edition of the Roswell *Daily Record* revealed that Mark Sloan, operator of the private airfield at Carrizozo, thirty-five miles south-west of the reported crash site, in the presence of flying instructor Grady Warren and pilots Nolan Lovelace and Ray Shafer, had witnessed a flying saucer speeding over the airfield at 10.00am at an altitude of about 4,000 to 6,000 feet. Sloan estimated that it was moving at between 200 mph and 600 mph and 'oscillating' as it travelled on a south-west to north-west course.

While no missile tests were being conducted at that time, there were violent thunder and lightning storms north-west of Roswell. Those could have accounted either for some of the reported UFO sightings or for the crash of *some* kind of aircraft.

Rumours began circulating to the effect that Brigadier General M. Ramsey, commander of the Eight Air Force District at Fort Worth, Texas, and Lieutenant General Hoyt Vandenberg, Deputy Chief of the Air Force,

had expressed their displeasure to Colonel Blanchard, commander of the Roswell Air Base, over his public information officer's unauthorized press release. Because of this, they had demanded that the man who located the crash debris, Major Jesse A. Marcel, personally fly it to Carswell Air Force Base, Forth Worth, Texas, for General Ramsey's personal inspection, before flying it on to Wright Field (Wright-Patterson AFB) in Dayton, Ohio, where it would undergo 'further analysis' under the personal supervision of General Vandenberg.

So widespread and persistent were these rumours that General Ramsey was driven to assuring the public, via a hook-up with Fort Worth's Radio WBAP, that the crashed flying saucer was in reality no more than a crashed Rawin weather balloon, that the remaining pieces of it were in his office, where they would probably remain, and that the 'special flight' to Wright Field had been cancelled.

This statement was supported with an invitation to the press to come and photograph General Ramsey and his assistant, Colonel (now retired Brigadier General) Thomas Jefferson Dubose, posing in the former's office with the debris of a real Rawin balloon. Colonel Blanchard, commander of the Roswell Air Base, went unexpectedly, or conveniently, on leave at the same time as Major Marcel was flying the crash debris to Carswell AFB, Forth Worth. He was replaced in his absence by the base deputy commander, Colonel Payne Jennings, who spent most of his time repeatedly telling the press that Blanchard was 'unavailable for comment'.

No sooner had the crash remains been delivered to Carswell, Forth Worth, than the base A-2 Division (Intelligence) chief, Colonel Alfred E. Kalberer, started making public appearances at various Fort Worth civic organisations, assuring them that there was no need for hysteria over crashed flying saucers. According to the records of the Forth Worth Army Air Base, while Kalberer was thus engaged, Colonel Irving, Assistant to the Chief of Staff, HQ Strategic Air Command (SAC), paid a visit to General Ramsey at Fort Worth for a discussion on an undisclosed subject, widely believed to have been the debris, and/or remains from the crash near Roswell.

In the days that followed, contrary to what the Army Air Force was trying to say about Rawin weather balloons, the word of numerous witnesses indicated that there may in fact have been *two* crash sites, both of which were connected with the same incident. There were also rumours about 'a large

flying saucer' and the remains of a number of small, humanoid creatures dressed in one-piece uniforms.

So what actually happened?

The first available information on the Roswell crash came from Major (now retired Lieutenant Colonel) Jesse A. Marcel, who at the time of the incident was the ranking staff officer in charge of intelligence at the Roswell Army Air Base. In interviews conducted between Marcel and UFO investigators William Moore and Stanton Friedman throughout 1979, Marcel confirms that he first learnt about the crash when, on 7 July 1947, he received a call from the Chaves County sheriff's office, in Roswell, informing him that a local rancher, W.W. Brazel, had come in to report that something had exploded 'over' his ranch, located on the south-east side of Corona, near Roswell, during a violent electrical storm several days before. According to Brazel, there was 'a lot of debris scattered everywhere'.

Brazel had not informed anyone before because he lived alone on his sheep ranch, thirty miles from the nearest town, and had no telephone.

On the instructions of his base commander, Colonel Blanchard, Marcel and a Counter-Intelligence Corps (CIC) agent named Cavitt followed Brazel out to the crash site, the former in a '42 Buick staff car, the latter in a Jeep Carry-all. In response to later enquiries about flying saucers and their occupants, Marcel stuck to his story that they found 'a lot of wreckage, but no machine'. Marcel was also adamant that whatever it was, the object had exploded above ground level and disintegrated before it hit the ground (thus confirming Brazel's description of an explosion 'over' his ranch), with the wreckage scattered over an area of about three-quarters of a mile long and several hundred feet wide. It was, he insisted, 'definitely not a weather or tracking device, nor was it any sort of plane or missile'.

The debris picked up was enough to fill the Carry-all and the trunk and back seat of the Buick. It included small beams, or rods, of an unknown material, which had indecipherable hieroglyphics embedded in them. They 'looked something like balsa wood, though they were not wood at all. They were very hard, although flexible, and would not burn'. Marcel's hieroglyphics were 'little numbers with symbols that we had to call hieroglyphics because [we] could not understand them... They were pink and purple. They looked like they had been painted on'. But: 'Those little

numbers could not be broken, could not be burned'. There was also a lot of 'unusual parchment-like substance which was brown in colour and extremely strong' and 'small pieces of a metal like tinfoil, except that it wasn't tinfoil... it was so light it weighed practically nothing'. Yet, as they were to find out later, the foil could neither be bent nor even dented with a 16lb sledgehammer. Also found was 'a black, metallic-looking box several inches square' and with no apparent opening. From this material, Marcel was only able to ascertain that the object had been big and constructed possibly from unknown materials. He could not judge its shape or general appearance.

The material was driven back to the Roswell Army Air Base, where reportedly it was stored in Hangar 84, which to this day remains sealed, unused, and off-limits.

The following afternoon, on orders from Colonel Blanchard, it was loaded onto a B-29 and flown to Carswell AFB, Forth Worth, Texas. There, after informing the press that the debris was from a crashed Rawin weather balloon, General Ramsey and his assistant, Colonel Dubose, staged their photo session. However, according to Marcel, after taking one photograph of him with a very small portion of the less interesting, albeit genuine wreckage, 'they cleared out our wreckage and substituted some of their own. Then they allowed more photos. Those photos were taken while the actual wreckage was already on its way to Wright Field.'

Marcel was adamant that 'it was General Ramsey who put up the cover story about the balloon just to get the press off our backs.'

Meanwhile, the unfortunate farmer, W.W. Brazel, was regretting having reported the incident. Shortly after leading Marcel and Cavitt out to where the wreckage was found, he was taken into custody and held incommunicado for almost a week. When he came out, on 15 July, he refused thereafter to talk to anyone about the crash.

Brazel died in 1963, but in an interview given to William Moore in 1979, Brazel's son, Bill, confirmed that for most of his remaining life his father had been 'very reluctant to talk about it at all... He took the most part of what he knew to the grave with him'. According to what Brazel *did* tell his son, the military, after locking him in a room and refusing to let him out, interrogated him for a week and then swore him to secrecy. 'He said they had told him to shut up because it was important to our country and was the patriotic thing to do, and so that's what he intended to do. He was very discouraged and upset

by the way they had treated him.'

Nevertheless, from what he could piece together from the various things his father told him over the years, Bill Brazel was able to confirm in just about every detail what Marcel had revealed about the crash, including the fact that in the middle of a lightning storm on the evening of 2 July 1947, his father had heard 'an odd sort of explosion, not like ordinary thunder' and that the following morning he had found 'this collection of wreckage scattered over a patch of land about a quarter mile long or so, and several hundred feet wide'. Bill Brazel's vivid recollections of the debris shown to him by his father match in almost every detail those given by Marcel. He also recalls his father saying that 'from the way this wreckage was scattered, you could tell it was traveling an airline route to Socorro, which is off to the south-west of the ranch.'

While there is no evidence whatsoever that dead aliens or UFOnauts were found at the Brazel site, Brazel's remark about 'an airline route to Socorro' is of interest in view of the fact that rumours have persisted to this day about another possible crash near Socorro, New Mexico, shortly after the crash near Roswell. It was widely believed that this was either a different disk entirely or the same disk which, after being damaged by an aerial explosion while flying over the Brazel ranch, had managed to fly for another 150 miles westward, before crashing.

The only evidence for this second crash is the word of Socorro civil engineer G.L. 'Barney' Barnett, who was working for the federal government in the area when he saw a disk-shaped object at rest on the Plain of San Augustin, west of Magdalena, New Mexico, on the morning of 3 July 1947.

Barnett died in April 1969, but was described by his boss, J.F. Danley, as 'a good man... one of the most honest men I ever knew'. Yet according to Danley, Barnett excitedly told him in the 'early summer' of 1947 that the flying saucers were real and he had just seen one. Danley instantly dismissed this as a joke, but a little later, when he asked Barnett if he had meant what he said, Barnett, now cooled down, would only add that he had seen a crashed object out on 'the Flats' (the Plain of San Augustin), that it had looked like a saucer, and that he didn't want to talk about it anymore.

However, Barnett later talked to other friends. While living in Socorro, he and his wife, Ruth, had become close friends with L.W. 'Vern' Maltais and his wife, Jean Swedmark Maltais. Interviewed by William Moore in

1979, the Maltaises confirmed that Barnett, a veteran of World War I, former commander of the American Legion Post at Mozquero, New Mexico, and engineer for the US Soil Conservation Service for twenty years, was the conservative, quietly self-assured type, not given to the spreading of wild rumours. Nevertheless, in February 1950, when the Mailtaises were visiting him and his wife in Socorro, Barnett told them that when working near Magdalena one morning, he saw ‘a large metallic object’ about a mile or so away on the flat desert land of ‘the Flats’. Thinking it was a crashed aeroplane, he approached it and found himself looking at ‘some sort of metallic, disk-shaped object about twenty-five or thirty feet across’. Even as he was studying it, some members of an archaeological team from the University of Pennsylvania arrived to study what they, too, had assumed was a crashed aeroplane.

Barnett was adamant that there were dead bodies both inside and outside the crashed flying saucer, which was made of ‘a metal that looked like dirty stainless steel’. The bodies were ‘like humans, but... the heads were round, the eyes were small, and they had no hair. The eyes were oddly spaced. They were quite small by our standards and their heads were larger in proportion to their bodies than ours. Their clothing seemed to be one-piece and grey in colour.’

While Barnett and the others were studying the crashed saucer and its strange occupants, all dead, ‘a military officer drove up in a truck with a driver’ and was followed by other military personnel. Barnett and the group from the University of Pennsylvania were told that it was their patriotic duty not to tell anyone what they had seen; then they were made to leave. The area was then sealed off and, presumably, the bodies and wreckage were removed by the military.

The basic scenario, therefore, is that somewhere between 9.45 and 9.50 on the evening of 2 July 1947, a UFO passed over Roswell, as witnessed by the Wilmots, then ran into storm lightning north of the town. As witnessed and heard by Brazel, it suffered some kind of explosion - either caused by a lightning bolt or by an internal malfunction - which sent debris raining down on the flatlands of Brazel’s ranch, near Corona. The damaged UFO then managed to fly as far as the Plain of San Augustin, near Magdalena, west of Socorro, where it finally crashed, resulting in the deaths of all crew members, whether alien or human.

As the intact, albeit damaged, saucer-shaped craft had crashed in Magdalena, it was easily traced and a military group from Alamogordo, in the White Sands Proving Ground, was able to get there quickly and remove the remains. However, since only debris had fallen near Brazel's ranch, and as Brazel had not notified the authorities until several days later, when the latter would have assumed that the event had been well suppressed, it was news of the Roswell crash, and not the Socorro crash, that inadvertently leaked and led to the now famous Roswell Incident. Although there appears to be no evidence for the second crash, other than the word of Barnett, there is plenty of evidence pointing to the fact that *something* crashed, if not in Socorro, then in Roswell, New Mexico, on 2 July 1947. Neither a weather balloon nor missile, it became the subject of a widespread cover-up.

Interestingly, the most persuasive case to date of a CE-III, or close encounter of the third kind, also took place in Socorro, New Mexico, nearly two decades later, on 24 April 1964.

The Socorro sighting is described by Dr J. Allen Hynek as 'one of the soundest, best-substantiated reports' and the only 'landing, trace and occupant' case listed as 'unidentified' in the Project Blue Book files.

In a sworn affidavit dated 8 January 1967, Opal Grinder, manager of the White Brothers' service station in Socorro, claimed that on Friday, 24 April 1964, at approximately 5.50pm to 6.00pm , the driver of a 1955 model Cadillac, which had a Colorado licence plate and also contained the driver's wife and three boys, stopped at Grinder's service station for gas. The agitated driver told Grinder that 'something traveling across the highway from east to west' almost 'took the roof off' his car as he was driving just south of town, north of the airport. He suspected the object had either landed or crashed, as he had also seen 'a police car head off the road and up a hill in that direction'. Continuing into town, he had met another police car heading in the same direction. To Grinder's suggestion that he might have seen a helicopter, the unnamed man said, 'That sure would be some funny helicopter!'

Given that Grinder's affidavit was made out three years after the incident, the sketchiness of the scenario is understandable. However, when speaking to Ray Stanford and other investigators a few days after the incident, Grinder's descriptions were more precise. According to these, the object observed flying only a few hundred feet to the north-east of the north-

bound Cadillac at 5.45pm on 24 April was ‘egg-shaped, had a smooth aluminium or magnesium-like surface, and seemed to be a little longer than the four-door Green 1955 Cadillac in which the family was riding’. The craft dropped to barely ten feet above the ground, flew directly at the Cadillac, and passed silently within ten feet of its top, almost touching the tip of the radio antenna. It streaked onward a few hundred yards to the south-west, where it stopped abruptly, hung in midair for about thirty seconds, then descended vertically, silhouetted by the low afternoon sun, to land just beyond a small hill which hid it from the view of those in the Cadillac.

The driver of the Cadillac and his wife then observed a white Pontiac police car as it turned off a north-south road that ran west of US Highway 85, cut across rough terrain, and headed for the rise beyond which the strange flying object had landed. Thinking that perhaps they had seen some ‘new type aircraft’ that was being developed in the area, the driver of the Cadillac kept driving toward Socorro, eventually passing another police car. This one, which was from the New Mexico State Police, was moving urgently in the opposite direction, also heading for where the strange aircraft had descended.

Once in Socorro, the driver of the Cadillac stopped at the Whiting Brothers’ service station on the north side of town, where he told the manager, Opal Grinder, what he had seen and complained that someone was flying ‘a funny looking craft’ dangerously low over the highway on Socorro’s south side, had landed, and was probably being checked out by the officer of the pursuing police car. Then the driver of the Cadillac continued his journey with his family.

The man in the white Pontiac police car was Lonnie Zamora, a 31-year old Socorro policeman described in a subsequent report by investigating FBI agent J. Arthur Byrnes Jr as ‘a sober, industrious and conscientious officer, and not given to fantasy’.

Zamora’s extraordinary experience had begun at approximately 5.45pm when he set off in pursuit of a speeding black 1964 Chevrolet, following it south, after pulling away from the west side of the courthouse. About a minute later, at approximately the same time as the unknown man from Colorado had sighted his UFO, when Zamora was a half mile south of Spring Street, he heard a roar and noticed a brilliant blue ‘cone of flame’ low to the south-southwest, at a distance of approximately 2,400 feet. As Zamora was wearing prescription glasses with green sunshades, he was at this stage

unable to distinguish the difference between the flying object's body and the 'blue cone of flame' shooting out of it. However, as the flame was over the location of a dynamite shack owned by the town mayor, Zamora assumed that the dynamite was blowing up, so instead of continuing his pursuit of the Chevrolet, he turned off the paved road and headed across the rough terrain, toward what now looked like a descending flame and sounded like a 'continuous roaring'.

Because of the position of the speeding Chevrolet, it is unlikely that its driver would have either seen or heard the descending object.

Zamora drove across the rough terrain, toward the roaring 'flame', for about twenty seconds. By this time he was able to note that the flame was definitely 'bluish, very brilliant, a little orange around the edges, more so near the bottom' and that it was 'sort of motionless, but appeared to *descend slowly*'. He could not see the bottom of the flame, which had just descended behind a hill; nor did he notice smoke; but some dust seemed to be moving over the area where it had landed.

The 'flame' disappeared completely behind the hill, but the roaring continued as Zamora tried more than once to make his Pontiac climb the steep, gravel-covered slope. Then, as he finally began to ascend successfully, the roaring of the hidden 'flame' died away.

Turning over the hilltop, Zamora saw a 'shiny type object' down in the ravine, or arroyo, to the south-west, at a distance of about 150 yards. He stopped his car for a few seconds, in order to study the object. At first he thought it was 'an overturned white car' with the far end raised higher than the nearest one. Then he saw two people in white coveralls very close to the object.

As if having heard Zamora's arrival, one of the persons turned and looked straight at his car, then jumped slightly, as if startled by seeing it there.

Zamora had only stopped for a few seconds. Now, as he started forward again in his car, he noted that the object was 'like aluminium - it was whitish against the mesa background, but not chrome' and it seemed oval or 'egg-shaped' with support legs extending obliquely from it.

The people in white coveralls looked like normal human beings, but 'possibly they were small adults or large kids'.

As he drove on again, Zamora descended into a dip and temporarily lost

sight of the object and the two people beside it. Worried that he might have come across a top-secret experimental vehicle from the White Sands Proving Ground, and wanting one reliable witness other than himself in case of trouble with the authorities, he radioed to the sheriff's office that he was checking a possible 10-40, or accident, down in the arroyo, and wanted New Mexico State Police Sergeant Samuel Chavez to come alone to the location.

As his message was being relayed to Chavez by Ned Lopez, the Socorro chief dispatcher, Zamora stopped his car again and started to get out, still talking on the radio. He dropped the microphone accidentally and leaned down to retrieve it. Even as he was straightening up, he heard 'a heavy slam, metal-like, heavier than a tank hatch... then another slam, real loud'. He was now completely out of his car and could see the object in clear view, about fifty feet away in the arroyo, with two of its four extension legs extending obliquely down to the ground. He could also see, for the first time, a large, red insignia on one side of the object's otherwise smooth, featureless, egg-shaped body.

The two people in white coveralls had disappeared - a fact which, combined with the metallic 'slamming' noises heard by Zamora, made him assume that they had entered the strange craft by some unseen door.

He had only taken two or three steps toward the object when he heard 'a roar... not exactly a blast, very loud roar... not like a jet... started low frequency quickly, then rose in frequency (higher tone) and in loudness, from loud to very loud'. At the same time he saw 'bright blue flame' shooting out from the underside of the object and it started to rise vertically from the ground.

Thinking that the object was about to explode, Zamora threw himself to the ground. He felt a wave of heat, but when no explosion came, though the roaring continued, he got up again and ran back to his car. Bumping into it while glancing fearfully back over his shoulder, he lost his glasses and sunshades. Picking them up, and determined to keep the car between himself and the ascending object, which he still felt might explode, he ran north across the mesa, glancing back two or three times to observe that in about five or six seconds the object had risen level with his car, about twenty feet above the bottom of the arroyo, and was still roaring and shooting flame from its underside.

About fifty feet from his car, when just over the rim of the hill, Zamora

turned back toward the object, but shielded his eyes with his arm in case it exploded.

At that moment, the roaring stopped and was replaced with a 'sharp tone, a whining sound' that went 'from high tone to low tone in maybe a second, then *stopped*'. Then there was silence.

Zamora saw that the object was no longer rising, though it was still moving: heading away quickly, in perfect silence, west-southwest, passing over, or rather south of, the dynamite shack as it flew away.

Realizing that the object was in flight and not exploding as he had feared, Zamora raced back to his car, picked up his glasses from where they had fallen, and once more radioed the Socorro sheriff dispatcher, Ned Lopez.

Lopez later confirmed that he had received the call from Zamora, breathlessly telling him to look out the window of the sheriff's office to see if the object was in sight. As Lopez was at the north window, not the south, and therefore could not see the object, he asked Zamora what kind of object it was. Zamora said, 'It looks like a balloon.'

Yet even as he was talking to Lopez, Zamora was watching the UFO disappearing in the distance. According to what he later told investigator Ray Stanford, it stayed about ten to fifteen feet above the ground, following the terrain, until it was near the perlite mill on the west side of US 60, about a mile away. There, it suddenly 'angled up at a steep climb and got small in the distance, over the canyon or mountain that way, *very fast*'. He remembered it as 'a bright, whitish oval getting smaller and smaller as it sped away, upward and over the mountains'.

Approximately one minute and fifty seconds after Zamora had first heard the roar and seen the 'flame' in the sky, the UFO was gone.

Sent urgently to the landing site by the message relayed through dispatcher Ned Lopez, New Mexico State Police Sergeant Sam Chavez reached Zamora just after the UFO had disappeared. Even as Chavez was approaching Zamora, the latter was making a sketch of the red insignia he had seen on the object before it took off. Though he had remained calm enough to do this, he was, according to Chavez, as 'white as a sheet' and in a cold sweat.

Examining the landing site with Zamora, Chavez also saw that the brush was smouldering in several places, after being ignited by the flame, and that there was what appeared to be a 'quadrangle' formed by four heavy, wedge-

shaped imprints in the soil.

Zamora's radio transmissions had been heard by others, including State Police Senior Patrolman Ted V. Jordan, who arrived at the landing site shortly after Chavez, in the company of Socorro Under-sheriff James Luckie. A cattle inspector named White, who had also heard Zamora's radio calls, turned up at the landing site; and just after 6.00pm FBI agent J. Arthur Byrnes arrived to investigate.

All of these witnesses were able to confirm that the brush had been scorched by flames and that the pad prints, or landing imprints, had been made, in the words of Ray Stanford, 'by wedge-shaped units being forced by great weight, down into the rather well-packed soil of the ravine'. The wedges had a horizontal length of 12 to 16 inches, a horizontal width of 6 to 8 inches, and a vertical wedge-depth of 4 to 6 inches, though this latter measurement was impossible to define accurately because of the inward falling of the soil. According to the detailed account in the 28 April 1964 edition of the local biweekly newspaper, *El Defensor Cheftain*, the landing gear imprints 'did not appear to have been made by an object striking the earth with great force, but by an object of considerable weight settling to earth at slow speed and not moving after touching the ground'.

Though some of the bushes were still smouldering when Chavez, Jordan, Luckie and White were present, they all agreed that there was 'no odour whatever that would indicate that combustion of any conventional fuel had caused the burn damage'.

Jordan was particularly impressed by the fact that the flame described by Zamora had obviously 'sliced' a large greasewood bush, located almost centrally in the landing gear quadrilateral, without leaving any signs of turbulence, such as that which would have been caused by normal rotors or jet exhausts.

Jordan also took Polaroid pictures of the landing site and the four imprints within minutes of arriving on the scene.

The details of the Socorro sighting and the landing site itself were investigated thoroughly not only by FBI agent J. Arthur Byrnes, but by Ray Stanford (later to become director of Project Starlight International and editor-in-chief of its *Journal of Instrumented UFO Research*, then in Socorro on behalf of the National Investigations Committee on Aerial Phenomenon [NICAP), and Dr J. Allen Hynek, in his official capacity as consultant to the

US Air Force (USAF).

Examination of the landing site revealed that the diagonals of the quadrilateral formed by the four landing marks intersected almost exactly at right angles. This led Hynek to speculate:

> One theorem in geometry states that if the diagonals of a quadrilateral intersect at right angles, the midpoints of the side of the quadrilateral lie on the circumference of a circle, and it is thus of considerable interest that the centre of the circle so formed [on the Socorro landing site] virtually coincided with the principal burn mark on the ground. Under certain circumstances the centre of gravity of the craft would have been directly over the centre of the circle, hence making the presence of the burn mark more significant.

At Hynek's request, USAF'S Project Blue Book chief, Major Hector Quintanilla, contacted the National Aeronautics and Space Administration (NASA), the Jet Propulsion Laboratory (JPL), and fifteen industrial firms in the vicinity to find out if they had been conducting any experiments with lunar landing models. They all said, 'No.'

In *Socorro Saucer* Ray Stanford claims that by 7.20pm. on the evening of the sighting, FBI agent J. Arthur Byrnes and US Army Captain Ord/C, Richard T. Holder, up-range commander of the White Sands Stallion Site, had met in the Socorro County Building where they proceeded to interrogate Zamora. In the course of this interrogation, Byrnes told Zamora that it would be better if he did not 'publicly mention seeing the two small figures in white' and Captain Holder 'recommended' that in future Zamora refuse to describe the insignia he had seen on the side of the vehicle to anyone other than official investigators.

What was the insignia?

Red in colour and approximately one-and-a-half feet tall, the insignia described and sketched by Zamora was an 'inverted V', or a vertical arrow, with a line under it, vertical lines on each side, and a parabolic arc over the point of the arrow. While author and computer scientist Jacques Vallee states that it is similar to a medieval Arabic sign for Venus, author and engineer Leon Davidson insists that it is confirmation that the UFO was a man-made craft. To support his claim, he points out that by moving and rotating the

lines of the drawing, the initials ‘CIA’ and ‘AD’ can be formed, the latter representing the initials of Allen Dulles, then head of the CIA. To this intriguing theory, Ray Stanford adds the notion that the parabolic arc above the arrow, or inverted V, could have represented a ‘stylized cross-section of the body of the craft (or a pressure wave)’ while the arrow, or inverted V, with a line under it, could indicate that ‘a *vertical thruster* was centrally located in it’. Stanford also believes that the placing of the symbol on the side of the craft, just above the thruster orifice on its underside, could have been a warning that the thruster was located there; while the use of red for the symbol could have been a danger sign, just as it is with current aircraft (and other) symbols.

The implication, therefore, is that the Socorro sighting was of a highly sophisticated, piloted, man-made craft that had flown from, and returned to, somewhere in the White Sands Proving Ground.

Chapter 9

-

UFOnauts and Close Encounters

There are a couple of sound reasons for concentrating on UFO sightings and encounters only in the US. The first is that while UFO landings and crashes have been reported from other countries, the US remains the most free with its information and, with the introduction of the Freedom of Information Act, has become even more so for the researcher. The second is that while we accept that highly advanced, disk-shaped aircraft may have been, or are being, created in countries other than the US, notably the Soviet Union, the available evidence makes us concentrate on the thread that leads logically from Germany's World War II technology to the US Navy's Flying Flapjack and the Canadian Avrocar, then on to the reports of UFO sightings, landings or crashes in the vicinity of the many top-secret military establishments scattered around New Mexico.

Most US atomic and space research, aircraft and missile development, and radar electronics and advanced weaponry experimentation takes place in New Mexico. It was from Eden Valley, near Roswell, south-east of Albuquerque, New Mecico, that Robert H. Goddard shot his first rockets skyward in the early 1930s. Shortly after World War II, the Roswell Army Air Field (now the Walker Air Force Base) became home to what was then the only combat-trained atom-bomb group in the world: the 509th Bomb Group of the US Army Air Force. Albuquerque itself is the home of the top-secret Kirtland AFB/Sandia National (Atomic Energy) Laboratories complex, located just south of the city, and the Manzano Nuclear Weapons Storage Facility, located to the east of Kirtland. New Mexico also contains the 'scientific community' of Los Alamos, created by the Manhattan (Atom Bomb) Project in 1943; once a 'secret city', it is still a highly restricted area, noted for its many atomic-energy laboratories. Two hundred and fifty miles south of Los Alamos is the White Sands Proving Ground, the US government's first rocket centre. The town of Alamogordo, lying between the Proving Ground and the site of the first atomic explosion, still proudly advertises itself as: *Home of the Atomic Bomb, Centre of Rocket*

Development. The Proving Ground, which measures 4,000 square miles, has on its western border the Organ Mountain (so named because its closely bunched peaks are said to resemble organ pipes) and is otherwise a wasteland of sand and sagebrush out of which have sprung the numerous restricted US Army and Air Force bases, including Holloman AFB, the location for several UFO sightings, as well as many of the US Naval Research Laboratory's top-secret experimental establishments.

Because of the proliferation and secret nature of these research centres, certain UFOlogists assume that the great number of UFOs observed over them – sightings reported mostly by base personnel – is an indication that the saucers are spy craft crewed by extraterrestrials. However, continuing space exploration has revealed that no planet known to us holds any form of life (many extraterrestrial theories and 'close encounter' stories have been discredited in the past decade by our growing knowledge of the Moon, Mars, and Venus) and that the problems of traveling to other galaxies are at this point seemingly insurmountable. Therefore we would appear to have increasingly valid reasons for believing that the 'circular, hyperbolic and spherical' craft of highly advanced capability are most frequently observed over top-secret military establishments because they are designed, constructed, tested and perhaps even used there, safe behind guarded fences, their reality confused by a constant smokescreen of disinformation.

If many of the sightings and encounters have taken place in such establishments, there have been even more extraordinary incidences elsewhere – Close Encounters of the Fourth Kind (CE-IV), or personal contact with, or abduction by, UFOnauts (UFO occupants, or crew members) – and since some of them, on first reading, appear to make mockery of the very idea of 'man-made' saucers, it is to them that we must now address ourselves.

One of the first and most famous contactee cases was that of George Adamski, a self-styled 'professor' in oriental mystical philosophy who founded his own cult (The Royal Order of Tibet), set it up as a religious community in California, then moved to Mount Polomar where, while working at a hamburger stand, he managed to convince many visitors, including journalists, that he was actually an astronomer at the famous observatory on the peak of the mountain.

In 1946 Adamski had written an unpublished novel, *Pioneers of Space*, which was about an imaginary journey to the Moon, Mars and Venus. It is very likely that this work of fiction was the basis of Adamski's later, hugely successful 'non-fiction' book, *Flying Saucers Have Landed* (1953), purporting to be a true account of how Adamski, in the company of friends (not including co-author Desmond Leslie), spied 'a gigantic spacecraft' near Desert Centre, California. Fearlessly approaching the saucer, Adamski met with a male Venusian with whom he communicated telepathically and with sign language. After explaining that the radiation from the fallout of Earth's atom-bomb tests was damaging the other planets in the solar system and that he had come to Earth to stop such tests, the Venusian gave Adamski a tour of the inside of his spacecraft. Before the spacecraft took off, Adamski was able to take a lot of photographs, but as one camera was out of focus and the other not working properly, he only managed to obtain a single, blurred photograph of the flying saucer, which was later widely derided as a fake. Adamski was also able to take a plaster-of-paris cast of the alien's footprint, though it was never satisfactorily explained why he had taken plaster-of-paris into the desert in the first place.

Adamski followed *Flying Saucers Have Landed* with two more books: *Inside the Spaceships* (1955), and *Flying Saucers Farewell* (1961). In these, he described his deepening friendship with the Venusians and numerous journeys made with them in their 'gigantic spacecraft' to the Moon, Mars and Venus, all of which contained wondrous cities and civilizations, none of which were remotely like the planets we now know so well. Other authors, including Truman Bethurum, Daniel Fry, Orfeo Angelucci, and Howard Menger, followed with similar tomes, most of them capitalizing on Adamski's contention that Jesus had been an alien spaceman and that the aliens were trying to save mankind from self-destruction through atomic warfare or fallout; but the (all male) authors also added the novelty of beautiful female extraterrestrials with whom they invariably had intimate relationships. In the age of the Cold War, with the atomic threat hanging over mankind, such books made for popular escapist reading.

As such early 'contactee' cases were fanciful nonsense, we can safely ignore them and instead turn to three of the most baffling 'abductee' cases on record: the New Hampshire case of 19 September 1961; the Pascagoula case of 11 October 1973; and the Alamogordo case of 13 August 1975.

Barney Hill was a black, 39-year old who worked for the United States Post Office. His wife, Betty, Caucasian, was a 41-year old State of New Hampshire social worker. On the night of 19 September 1961, when driving from Canada to New Hampshire along US Highway 3, through the White Mountains, they were tracked by a 'spinning' white light. When the light eventually approached their car, the Hills saw that it was 'a large, disk-shaped craft with windows around its rim'. Six beings, wearing dark uniforms, were watching them from the windows. According to the Hills' initial recollection, the craft was now hovering in the air fifty feet away, so they stopped to let Barney get out and look at it through his binoculars. As he did so, the object descended vertically and landed. 'Two fins, each bearing a red light, were slowly extending from the right and left of the craft. Another extension was lowered from its base.'

Terrified, Barney jumped back into his car and drove off quickly. He and Betty heard 'an irregular beeping sound' coming from what seemed to be the trunk of their car, and both experienced a 'tingling sensation and drowsiness'. Aroused by another series of beeps, they discovered that they had travelled thirty-five miles and could not recall what had happened in between. Also, their wristwatches had stopped running.

Ten days later, Betty began to suffer from vivid dreams in which she and Barney were taken aboard a flying saucer and medically examined. About a month after the incident, she and Barney realised that the trip from Canada to Portsmouth had taken at least two hours longer than it should have.

Beginning in December 1963, almost two troubled years after the UFO sighting, Betty and Barney were hypnotised repeatedly, in independent sessions, by Boston psychiatrist, Dr Benjamin Simon. Over the course of many sessions, Barney and Betty revealed separately that during the missing two hours of the night of 19 September 1961 they had been taken aboard a 'spacecraft' by 'humanoid' creatures with 'large eyes that reached around to the side of the head, no nose, and a mouth that was a slit without lip muscles'. The humanoids communicated telepathically. Betty and Barney were medically examined by the humanoids, shown a map consisting of dots, which they were told were galactical travel routes, then returned to their car. From inside the car, in the company of their visibly frightened dog, they were able to watch the 'spacecraft' ascending again, increasing in brilliance and resembling 'a glowing orange ball' as it left.

At the end of the many hypnotic sessions, Dr Simon's conclusion was that the Hills had 'undergone an imaginary experience caused by fear after an actual UFO approach'.

However, under posthypnotic suggestion, Betty Hill drew the star map she had been shown aboard the spacecraft and the results appeared to suggest something she could not possibly have known about: the stars Zeta 1 and Zeta 2, located in the Reticulum constellation and long held to be prime candidates as a possible source of extraterrestrial life.

While there are arguments against this interpretation of the map drawn by Betty Hill, and while the New Hampshire case in general has its detractors, it has become one of the most famous and controversial UFO 'abductee' cases on record. Almost as well known is the Pascagoula case. This began on the evening of 11 October 1973, when two shipyard workers, Charles Hickson and Calvin Parker, were fishing off a pier on the Pascagoula (Singing) River, just outside the city of Pascagoula, Mississippi – an area with a heavy concentration of government space research and military installations. Hearing a sudden buzzing noise, Hickson and Parker looked behind them to see a large eggshaped, or oblong, craft that was glowing a bluish-white as it hovered about three feet above the ground near where they were sitting. Paralysed with fear, both men watched as a door in the craft opened and three beings emerged and *floated* up to them. These creatures then took hold of Hickson and Parker (the latter had fainted), and 'floated' them into the UFO where, in a brightly lit room that had 'no corners or edges' (ie., circular), the still conscious Hickson was 'levitated' into a horizontal position and given what appeared to be a medical examination by a free-floating device. About twenty minutes later, both men were deposited back on the river bank, the UFO left the area ('straight up'), and Parker then regained consciousness.

Hickson and Parker were interrogated separately by intelligence officers at Keesler Air Force Base and the case was later investigated by J. Allen Hynek, representing the National Investigations Committee on Aerial Phenomena (NICAP), and University of California civil engineering professor James Harder, a consultant to the Aerial Phenomena Research Organization (APRO). While certain discrepancies in the reports indicate that Hickson and Parker may have been party to a hoax designed to lure tourists to the town, Hynek remained open-minded about it and Dr Harder, after

hypnotizing both men, said, ‘They are not unbalanced people, not crackpots… Hickson and Parker have been through a terrifying experience.’

Whether hoax or reality, the descriptions given of the UFOnauts are of particular interest. The creatures were less than five feet tall, with grey, wrinkled skin. Their heads were round-shaped, with no necks. They had ‘pointed protrusions’ jutting out where their ears should have been. They had no eyes. There was only ‘a small opening’ under the nose where the mouth should have been, though this could have been a covering made either from thin metal or ‘wrinkled’ material ‘like an elephant’s skin’. The ‘shapeless’ legs of the creatures ended in round feet with no toes. Most remarkably, they had unusually long arms with what resembled ‘claws’ instead of human hands.

Based on the descriptions obtained by Hickson and Parker during the hypnotic sessions, Dr Harder preferred to describe the UFOnauts as ‘automata’ with ‘pincers at the end of armlike appendages’. It was his belief that they were ‘advanced robots’ and that it was perfectly natural for the terrified Hickson and Parker to have projected human characteristics onto them.

This leads us naturally to the Alamogordo case, which has striking similarities to those mentioned above. On 13 August 1975, at about 1.15am, US Air Force Sergeant Charles L. Moody was watching a meteor shower over the desert near Alamogordo, New Mexico, when he saw ‘a glowing, metallic, disk-shaped object’ descend about 300 feet away, to an altitude of fifteen to twenty feet. Judged by Moody to be about fifty feet long and eighteen to twenty feet wide, it ‘wobbled on its own axis’ before moving steadily toward him. Unnerved, Moody attempted to drive away, but was unable to start his car. The UFO stopped its advance about seventy feet away, thus enabling Moody to see ‘a rectangular window’ and, framed by it, shadows resembling human forms.

By this time, a high-pitched whining sound could be heard. When it stopped abruptly, Moody felt a numbness creeping over his body. The next thing he remembered was the object rising into the sky and disappearing into the distance. When Moody turned the ignition key in his car, it worked normally, letting him drive back to his house, though still feeling terrified. Checking his wristwatch as soon as he arrived home, he saw that he had somehow lost about ninety minutes.

In the days immediately following the event, Moody suffered various psychosomatic illnesses. On the recommendation of his physician, he practised self-hypnosis and eventually pieced together just what had happened to him on the night of August 13. According to these recollections, shortly after the whining of the UFO had stopped and Moody felt the numbness creeping over him, two creatures, both about six feet tall and wearing skintight black clothing, approached his car. After a brief struggle, Moody was somehow rendered unconscious and awoke on a slab inside the craft, feeling paralysed. Looking down at him were the two creatures who had captured him, plus another one, only five feet tall and wearing a silvery white suit. Like the other two creatures, he had a large hairless head, a protruding brow, roundish eyes, small ears and nose, and very thin lips. His skin was whitish-grey'. The creature seemed to speak telepathically.

When the terrified Moody agreed not to resist, the shorter UFOnaut, whom Moody assumed was the leader, relieved his state of paralysis by applying a 'rodlike device' to his back. Moody was then shown around the ship and noticed a 'sweet, stifling odour'. He was informed that the UFO's 'mother ship' was located 400 miles above the Earth (Moody later changed this figure to 6,000), promised a future meeting with the occupants, and told that 'future contact with Earthmen' would not be attempted for another twenty years. Finally, after telling Moody that he would have no recollection of this experience until about two weeks later, the short UFOnaut placed his hands on the sides of Moody's head and rendered him unconscious. Moody awoke in his car just as the UFO was leaving.

The delayed recollections, psychosomatic illnesses and need for hypnotic retrieval of the experience make this similar to the New Hampshire case in particular. However, in all three cases communication was made by telepathic means and those abducted underwent some kind of physical examination. The creatures in the New Hampshire case had 'large eyes that reached around to the side of the head, no nose, and a mouth that was a slit without lip muscles'. The creatures in the Pascagoula case had 'no eyes. There was only a small opening under the nose where the mouth should have been', though this could have been a covering made either from thin metal or wrinkled material, 'like an elephant's skin'. In the Alamogordo case, the creatures had 'roundish eyes, small ears and nose, and very thin lips' with 'whitish-grey' skin.

Such descriptions, albeit distorted by terror and confused recollection, are surprisingly similar to one-another, as they are to the other famous abductee cases. For instance, in the Kelly-Hopkinsville, Kentucky, incident of 21 August 1955, the UFOnaut observed by teenager Billy Ray Sutton was about four feet tall and had ‘a round head’ with pointed ears, and ‘long arms’ with ‘clawlike’ hands. Bullets seemed to ricochet off it and similar UFOnauts, as if they were ‘covered in nickel-plated armour’, and they appeared to be able to ‘float’ like the creatures in the Pascagoula case. In the Cisco Grove, Placer County, California, case of 4 September 1964, the UFOnauts observed by three hunters were over five feet tall and dressed in silvery-white uniforms with hoods or helmets that went straight up from their shoulders; but they were accompanied by short, stocky, ‘robotlike’ creatures that were ‘dark grey or black’ in colour, had no discernable neck, but possessed ‘enormous, glowing eyes’ above ‘a square, hinged jaw which dropped open to form a triangular hole in the face’. What appeared to be a cloud of steam emitted from the hole. In the Betty Andreasson case of 25 January 1967, the UFOnauts were approximately four feet tall and had ‘pear-shaped’ heads with narrow chins, ‘holes’ for noses, ‘scarlike slits’ for mouths, and ‘large, almond-shaped eyes slanted around to the sides of their heads’ (exactly like those in the New Hampshire case of 1961). In the Falkville, Alabama, case of 17 October 1973, the UFOnaut observed up close and photographed by Police Chief Jeff Greenshaw was like ‘a man wrapped in aluminium foil’. It had ‘an antenna’ on its head but was otherwise featureless, and walked with ‘a stiff and mechanical gait’.

It is clear, then, from these descriptions and others, that the UFOnauts observed by the majority of contactees and abductees are either normal, albeit tallish, creatures very much like human beings or short creatures with certain human characteristics but also possessing bizarre, even nightmarish physical attributes. Though Dr Harder describes the latter as ‘automata’ and believes them to be ‘advanced robots’, contactee descriptions of ‘wrinkled’ and ‘whitish-grey’ skin, ‘like an elephant’s skin’, suggest that they may be cyborgs – half man, half machine.

If this were the case, neither the tall, human-like creatures nor the short, robotlike creatures would necessarily have to be extraterrestrials; they could in fact come from right here on Earth. However, the theory of Earthly origin would still be confronted with the other seemingly ‘magical’ or ‘impossible’

aspects of so many contactee and abductee reports, including paralysing or mesmerizing ‘devices’ and ‘beams of light’; levitation; telepathic communication; and information about the supposed extraterrestrial origin of the UFOs and their occupants.

Yet all of these aspects of the reports may be explainable within the present technology.

The brain controls most of our bodily functions, including what we see, hear, smell and feel. Yet since the brain is rarely used at even a *tenth* of its full potential, by awakening certain dormant areas of it, or by deadening others, either electrically, by the use of drugs, or through hypnotic suggestion, the scope of both our senses and our capabilities can be dramatically expanded or reduced, and our whole mode of behaviour changed. Such methods of affecting the brain can also induce pleasure, fear, many other emotions, and even physical pain; they can therefore be used to ‘reward’ or ‘punish’ the subject in a Pavlovian manner and by so doing completely control him.

Regarding the most common form of mind-control, namely hypnotism, the same principles apply, the only difference being that the sensations are induced, or recalled, by a process of suggestion, rather than by physical means. However, through routine hypnotism the subject can be directed to go to sleep or waken up, feel non-existent pain or ignore applied pain, turn as rigid as a plank, relive long forgotten experiences or forget past experiences, and frequently do what he would not normally contemplate. So real can the hypnotic experience be that a hypnotised subject, if told that he has just been scalded, will actually come out in blisters. Alternately, the same subject can be burned or pierced with needles and experience no pain at all; nor will he be marked with the burning or piercing when snapped out of the trance state.

It is a common misconception that only certain kinds of individual can be hypnotised. In fact, any intelligent adult and most children over the age of seven can be hypnotised. Only the mentally retarded and the psychotic can *resist* being hypnotised. Hypnotisability is in no way a sign of weak will. Indeed, the more intelligent and imaginative the individual, the better a subject he will be – but certainly most individuals can be hypnotised, whether or not they want to be.

There are three prime states of hypnotism: light, medium and heavy, the latter being a state of somnambulism.

Contactees frequently tell of how, though frightened, they felt drawn toward the UFOnauts or, at least, felt compelled to obey them – even when it seemed that the UFOnauts had not actually *spoken*. Another common denominator in the contactee experience is the feeling of remoteness, of divorce from the self, with the contactees invariably behaving as if they are zombies.

This is often the case with the (often rapidly flickering) 'beams of light' that emanate from the UFO – often accompanied by 'eerie' sounds – or from the hands of, or apparatus used by, the UFOnauts. When the contactees are struck by the flickering beam of light, they are either rendered unconscious (to reawaken elsewhere, usually in a daze) or placed into a state of what can only be described as fully conscious suspended animation: they are aware of what is happening to them, but unable to resist it in any way. In this condition, they are often convinced that they are 'floating' or 'gliding' between their captors and into the UFO; and that their captors are not actually speaking to them, even though they, the abductees, can somehow 'hear' what their captors are saying.

Such sensations are fully consistent with the hypnotic state. Once a person has been conditioned to accept the hypnotic state, a simple phrase or gesture (the waving of a hand; a light touch on some part of the face or head) can be used to put them into a hypnotic trance – but still awake, with eyes open.

As the often reported 'beams of light' emanate from the UFO and not the UFOnauts, we will return to them in a subsequent chapter. For the moment, let us concentrate on the other widely reported UFOnaut method of mesmerizing, which is the pressing of the contactee's neck, either by hand or with some kind of metallic device. This either renders the contactee unconscious or without will while still fully conscious.

Although this seems singularly mysterious, it is in fact another standard form of hypnotism: the 'instantaneous technique' or the 'carotid procedure', both of which are based on simple biology: the hypnotist merely applies pressure to a blood vessel near the ear, thus inhibiting the heart rate, interfering with the circulation of blood to the brain, and rendering the subject dazed and confused, and susceptible to suggestion.

'Wide awake' hypnosis is a commonplace hypnotic state in which the subject knows exactly who he is, where he is, and what he is doing – even

though only capable of doing what he is instructed to do by the hypnotist. This particular form of hypnotism can even be applied to a sleeping subject. The hypnotist simply attracts the attention of the sleeper with some sort of physical contact, hypnotises him by repeatedly telling him that he can hear the hypnotist's voice, has him perform what is required of him, then very gently puts him back to sleep. He will later waken up in a normal fashion, but with absolutely no recollection of being hypnotised or what he did while in the hypnotic state.

The 'amnesia' or bewildering, though uncomfortably familiar 'nightmares' suffered by so many contactees (as with Betty and Barney Hill) could be either a form of remote-controlled brain implantation, as discussed below, or a form of post-hypnotic suggestion. In this condition, the victim can be conditioned to remember nothing about what has happened to him – or, for the hypnotist's purposes of disinformation, to remember *some* of it, but only enough to confuse or frighten him or those who listen to him, because what he recollects will seem so senseless, bewildering, and therefore frightening.

Normal hypnosis could certainly account for this. However, electric brain implantation would be an infinitely more powerful and lasting way of doing the same thing.

As early as 1932 Dr Walter Hess had devised the modern technique of electrode implantation, thereby demonstrating that most of man's functions and emotions can be influenced by stimulation of specific areas of the brain. A simple method of doing this is to inject radiopaque materials into the intercerebral spaces inside the skull to facilitate, by X-ray, the visualization of various parts of the brain. This is done with a stereotaxic skullcap (similar devices are often described in UFO abductee reports) which, utilizing minute spikes that pierce the scalp, takes X-rays from many different angles and makes geometrical calculations to give three-dimensional coordinates for the positioning of the electrodes. The steel electrodes, which are as thin as hairs (small enough to be placed inside an individual nerve cell) are guided into the skull by micromanipulators, after which they can release the light electric current required for stimulation of the chosen area.

A state of constant drowsiness can be brought about by the electric stimulation of the caudate nucleus, the nucleus reticularis, or the inferior thalamus. Conversely, a similar stimulation of the mesencephalic reticular

formation will induce instant arousal. Another example is the hypothalamus: the area of the brain which controls our most basic, primitive needs. By stimulating the appropriate areas of the hypothalamus with submicroelectric electrodes, the controller can regulate the subject's blood pressure, heart rate and respiration; control his sleep or appetite, even the diameter of his pupils; can place him into a state of suspended animation or make him work till he drops. In short, he can totally control the subject's bodily and mental functions and even, with the aid of the appropriate computer-controlled interfacing equipment, do so from a distance, with the subject (or victim) not knowing that he is under control.

The possibility of physical and mental control of human beings was already well developed by the mid-1960s, with many bio-engineers claiming that computer and human brain would soon be directly linked. Said R.M. Page of the US Naval Research Laboratory: 'The information which a machine can obtain and store from a person in a few minutes will exceed the fruits of a lifetime of man-to-man communication.' As to method: 'The coupling mechanisms to carry out the functions will be myriad, including in some cases electrical connections to the body and brain. Some connections may be wireless, with imperceptible transmitting elements implanted in the body.'

While such research work was clearly under way in the top-secret experimental establishments of the White Sands Proving Ground (where the US Naval Research Laboratory, among others, has its own research centres), ESB, or electrical stimulation of the brain, was becoming dangerously innovative elsewhere. The suggestion that computer-controlled electrodes be implanted in the brains of babies a few months after birth, thus robotizing them for life, was made by the American electronics engineer Curtiss R. Schafer in a paper he presented before the National Electronics Conference in Chicago. In a similar mood, Dorman S. Isreal, a fellow of the Institute of Radio Engineers, proposed that 'newborn infants can be operated on and the latest submicroelectrical equipment installed in the brain and at certain critical points in the spinal column' in order to give them the benefits of 'non-radio communicative powers' and also enhance their creativity ability.

While such suggestions may have been made half in jest, it was already clear by the early 1970s that such proposals were being taken seriously by many scientists and that much of the experimentation was moving beyond the

already controversial area of vivisection and into the human arena, with subjects wired for electrosleep, electroprostheses, electrovision, electroanalgesia, electroanaesthesia and, increasingly, electrosociology.

In the field of electrosociology, Dr Jose M.R. Delgado, professor of physiology at the Yale University School of Medicine, and Dr James Olds of McGill University in Canada, both experimented extensively with the so-called 'pleasure centres' of the human brain, as did Dr Robert G. Heath of Tulane University. Meanwhile, Dr C. Norman Shealy, chief of neurosurgery at the Gunderon Clinic in La Crosse, Wisconsin, had perfected electro-analgesic techniques to the point where they were being applied to humans, mainly through the implanting of a .8 to 1.2 stimulating electrode in the spine rather than the brain. Regarding electrosociology, a team of doctors at Massachusetts General Hospital and Boston General Hospital were 'pacifying' violent human subjects with the implantation of electrodes into the rostral part of the caudate nucleus of the brain.

Such experiments had been going on for years – overtly in animals, covertly in human beings, with the latter experiments usually cloaked in secrecy. What *is* known is that electrodes implanted in the human brain have been used successfully to activate paralysed and artificial limbs; to control otherwise uncontrollable muscular spasms, as in Parkinson's Disease; to pacify violent mental patients and prisoners; and even to initiate 'thought control' between a human controller and a computer.

Given that any form of human brain manipulation can have frightening social and political ramifications, many of the experiments on humans have been conducted behind closed doors, most notoriously in mental institutions and state prisons, where prisoners receive certain benefits for becoming so-called 'voluntary' guinea pigs. The results of such experiments are rarely discussed openly, but given what has already been accomplished in these fields, it is safe to assume that remote-controlled 'programming' of individuals is well within reach and may, indeed, now be widespread.

Certainly it is no secret that the reflexes and appetites of animals have been controlled at a reasonable distance by a controller seated behind a computer-linked console. Such an animal can be made to sit, stand, play, fight, collapse in terror, eat, or starve itself to death. Regarding human beings, by the end of the 1960s it was still only possible (in unclassified experiments) to stimulate specific areas of the brain and do so under

immediate visual control. However, the possibility of long-distance control of implanted human beings was being explored in many areas; and though it was generally believed that the particular response required would be programd at the time of the implantation – fed into the brain via the computer – and would be limited to one or two responses only, those were early days and the reports were only of known experiments.

On the assumption that great advances have been made since then, it should now be possible to implant an electrode, or electrodes, in the brain of a human subject and then program him to feel pain or terror each time he attempts to recollect what his controller wants him to forget. This could certainly account for the many reports of amnesia, followed by headaches, nausea, terror or acute bewilderment, when the contactees have tried to recall exactly what had happened to them.

In *Phoenix* and *Genesis* (Books Two and Three in the *Projekt Saucer* series), I offer the present state of progress on prosthetics and other surgical nightmares as a possible explanation for the physical appearance and peculiar abilities of the UFOnauts. Since the reality of such creatures borders on science fiction, rather than fact, it will be instructive to look back at the work that was being done in those relatively early days in the various areas relating to UFOnaut appearance and capability.

By 1980 in the field of prosthetics work had been progressing with remarkable speed and success on the artificial heart (South Africa's Dr Christiaan Barnard completed the first human heart transplant in 1967), lung, gut and gill, as well as artificial cells, blood vessels, intestines and even skin. Artificial bones, joints and sockets were being used with increasing success, the main alloys being of the cobalt and chromium variety: tantalum, titanium, niobium and molybdenum. Blood vessels, heart valves, bone, skin, blood and even the cornea of the eye were all being preserved artificially. Skin, stored in DSMO for periods of years, had already been grafted successfully to the human body by researchers at the University of Pennsylvania School of Medicine. Bone frozen for years and revived with cobalt radiation had also taken when grafted to the body. Likewise, red blood cells had already been freeze-dried for years and as early as 1980 tissue banks were becoming commonplace. Indeed, as long ago as 1980, even before my novel *Genesis* was published, the US Navy tissue bank was able to supply some 3,000

square inches of human skin to Brazilian fire victims.

In external prosthetics, the myoelectric control of limbs was racing ahead. The Soviets were making the greatest advances in this particular field and had already perfected a hand-arm prosthesis in which all five fingers were capable of closing around objects of variable shape with the precision of a human hand. British scientists had developed, among other advanced prosthetics, myoelectric arms with interchangeable hands; while in the United States, a team of scientists and engineers from Harvard, MIT, and Massachusetts General Hospital, had developed a sophisticated myoelectric arm that could move at any angle, speed or force simply by being *thought* into action. The arm picked up muscle signals generated to the natural stump, transmitted them to a small amplifier, and used it to drive a compact electric motor. The machinery for all of this was housed inside a flesh-coloured, fibre-glass casing that resembled a real arm.

However, researchers at the Powered Limbs Unit of West Hendon Hospital, near London, England, were soon advancing on the above by developing an implantable electrode, or transmitter, called an Emgor. This used a resonator circuit that did not require batteries to detect myoelectric signals, thus obviating the need for frequent surgical intervention to replenish the power source.

Regarding the extent to which some surgeons would go openly in this kind of development, and to which some patients would willingly let themselves be used in the desperate hope of prolonging their lives under any circumstances, it should be noted that according to *World Medicine*, 1 March 1966, ‘lower body prosthetics’ had already been developed to the point where some surgeons were willing to perform hemicorporectomies: amputation of the entire lower half of the body, including legs, rectum and genitalia. This procedure had already been offered to patients in a prominent New York hospital as an alternative to death by abdominal cancer. Among those who accepted the offer was forty-nine year old James Cavorti who, ‘after months of the most mutilating and demoralizing operation known to surgical science, returned home with a complete lower-body prosthesis to support his sixty-pound torso’.

David Fishlock, who recounts the above story in his book, *Man Modified: An Exploration of the Man-Machine Relationship* (1971), gives other chilling

examples of just how much certain individuals may be willing to let themselves be butchered or mutilated if they have strong enough reason (one of his examples being that certain, perfectly sane, professional deep-sea divers would be willing to 'face the hazards of using their lungs as gills, in order to breathe underwater'); but both Fishlock and Vance Packard, author of *The People Shapers* (1978), show a healthy concern for the dubious attitudes and ethics of the 'bio-medical engineering' profession.

Living in a democratic society, it is hard to imagine that the involuntary use of human experimental 'animals' could take place anywhere other than in a Nazi concentration camp. However, as Fishlock makes clear: 'Even today there are people who believe that convicts, especially the criminal lunatic, and even conscientious objectors, should be compelled to lend themselves to science.' As an example of a much milder and widely accepted form of this, Fishlock points out that destitute citizens in the US can acquire a measure of care and attention in exchange for 'freedom of access to their bodies'. (Such 'access' would include the selling of blood, as well as laboratory sex with other humans or with the aid of prosthetics, frequently while being photographed and filmed.) In order to emphasise that many other scientists would be willing to go, and have gone, much farther than this, Fishlock tells us that in *Human Guinea Pigs* (1967) by Dr M.H. Pappworth: 'His search through a portion of the medical literature of recent years has yielded a wealth of evidence that experiments are made freely by a small number of medical research teams in the USA and Britain, on the sick and dying, on geriatric patients, on criminals, even on infants and pregnant women.'

The extent to which highly educated and supposedly civilized men will go to create a Brave New World is detailed in even more nightmarish detail by Vance Packard in *The People Shapers*. As this book was published sixteen years ago, it is chilling to read what had already been seriously considered up to that time. One of Packard's more illuminating examples is the 'amiable and highly respected' New York psychiatrist, Willard Gaylin, who 'explored at length' the possibilities of 'harvesting' the living dead and preserving them in special 'bioemporiums' that would house 'living cadavers' attached to respirators. In the words of Packard: 'Since their brains had stopped functioning they would be legally dead. But they "would be warm, respiring, pulsating, evacuating, and excreting bodies"' and could therefore be maintained for many years as 'a source of spare parts' and for medical

experimentation of all kinds.

We are reminded by Packard that in the Cleveland Clinic's Department of Artificial Organs, not only medical specialists, but 'mechanical, electrical, chemical, and biomedical engineers, as well as biochemists and polymer chemists', were, in their busy operating theatres, enthusiastically engaged in 'surgery connected to the development of artificial substitutes for other vital organs such as the liver, lungs, pancreas, and kidneys'. Conveniently within walking distance of the Cleveland Clinic's Department of Artificial Organs are the Neurosurgical Research Laboratories of the Cleveland Metropolitan General Hospital, where great interest was being expressed, as far back as 1967, in the possibility of transferring the entire head of one human being to another. Switching human *brains* from one head to another would be complicated and costly; but as Packard explains: 'By simply switching heads, on the other hand, only a few connections need to be severed and then reestablished in the neck of the recipient body.'

Robert J. White, then professor of neurosurgery at Case Western Reserve Medical School and head of the Cleveland Metropolitan General Hospital's live brain transplant research team, informed Packard that he preferred to call the procedure 'a cephalic transplant' because 'the phrase "head transplant" seemed to give some people the shivers'. The good doctor might have felt this way because in the same hospital some 'isolated' animal brains were being kept in cold storage while others, less lucky, were 'functioning, warm brains' that were being 'kept alive by hookups to blood machines or to live individuals of the same species. What is going on mentally inside those disembodied brains is a matter of speculation'.

In 1908 the American vascular surgeon, Charles Guthrie, grafted an extra head onto a dog, thus creating a two-headed animal; and in 1968 a team of Russian surgeons, led by Professor Anatoli Kanevsky, repeated the experiment more than once, then proudly reported that their twin-headed dogs ate, slept and performed their physiological functions normally, as if nothing had happened.

Nevertheless, while in those early experiments the head transplants did not survive long, brain-wave and chemical tests showed them to be functioning normally while alive and, according to Packard, 'somewhat better than before they were "isolated"', though possibly feeling 'bored and lonely, living on old memories.'

Certainly, with regard to the Cleveland Clinic's monkeys with transplanted heads, Professor White was adamant that the brains remained operational as far as the eyes, ears, nose, face and tongue were concerned. If a monkey was aggressive before the head transplant, it would remain that way after the transplant; if gentle before the transplant, it would remain so afterwards. Also, most of the heads that had been transplanted showed 'every indication of being alert to what was going on'. In other words, the transplanted heads would make sounds, accept and chew food, and track a human being with their eyes as he or she walked past them. So, though the monkeys with transplanted heads lived only a week, they were functioning properly while still alive.

At the time of these experiments, in the early to mid-1970s, it was known that the recipient body would remain out of contact with the brain 'until scientists master the problem of regenerating severed spinal cords'. However, it was White's belief that if we could grow spinal cords, we could 'transplant heads of humans with hope of achieving reasonably normal people'.

Indeed, in June 1976, even as Professor White was conducting his head transplant experiments with monkeys, a Soviet scientist, Levon A. Matinian, reported at the fourth biennial conference on Regeneration of the Central Nervous System that he had succeeded in regrowing the spinal cords of rats. Given that *Science News* described this achievement as one of 'monumental importance', it has to be accepted that more work in this area has continued behind closed doors and may now be remarkably well advanced.

Were this not enough, Packard informs us of the following: In one medical experiment, 'the heads of eight live young fetuses were cut off and then injected with radioactive compounds to study brain metabolism'. At a hospital for elderly chronic patients in Brooklyn, 'live cancer cells were injected into debilitated patients who did not suffer from cancer' in order to determine if cancer could be so induced. And at an institute for mentally retarded children on Staten Island, some of the children were injected with live hepatitis virus.

Last but not least, Packard points out that: 'A recent issue of *Modern Medicine* reported that most doctors favour experimentation on humans, even on prisoners, children, the mentally retarded, and other captive subjects, as long as there is peer review.' As in practice, peer review committees consist 'overwhelmingly of fellow staff members', Packard was of the opinion that

little legal, ethical, religious, or scientific restraint would be placed on such gruesome activities.

If such experiments were taking place in public hospitals and institutions so long ago, who is to say that even more ambitious experiments were not taking place behind the guarded fences and locked doors of the world's most secret military and scientific establishments? As David Fishlock reminds us: 'Men accustomed to solving the most intricate problems that aerospace and weapon technology could conceive turned with confidence to those of medical engineering.'

They certainly did. Remote-controlled robots are called 'phantoms' and at least two decades have passed since NASA's Manned Spaceflight Centre, in cooperation with the Illinois Institute of Technology Research in Chicago, produced 'a very sophisticated phantom' that resembled 'a human being in shape and size and in the way it moves its thirty-five joints, thirty-three of them fitted with strain-gauge torque sensors. In fact, it does almost anything but walk…' By the mid-1960s those primitive robots, or phantoms, had evolved into 'master-slave manipulators' called CAMS, or Cybernetic Anthropomorphous Machine Systems, which were designed to 'unite man's complex of sensory mechanisms with the power and versatility of a machine'. Used mostly for work in environments hostile to man (the sea bed, outer space, the handling of radioactive and other dangerous substances), the CAMS, or 'slave' machine, is operated by remote-control and 'mimics its master's arm, finger and thumb movements with such finesse that it can twirl a hula-hoop with its one digit'. This man-machine coupling was so efficient that 'the man need not think about the machine at all; he simply concentrates on the task'.

The early CAMS were operated through hydraulic servo-mechanisms that had their limitations, but progress was soon made on the 'sensitive coupling of the operator's nervous system' to powered manipulators that were even more versatile than human limbs. Interested in remote-controlled machines that could assist in the 'hostile' environment of a nuclear accident or attack, the US Air Force Weapons Laboratory soon produced 'an eleven-ton monster with two manipulators, each having six degrees of freedom and a nineteen-foot reach'. Not to be outdone, the UK Atomic Energy Research Establishment, at Harwell, England, created a 'remote inspection vehicle' which 'moves with the profile of a crawling man to gain access, but once in

position can stand erect in order to deploy its “eyes” and “arms”’.

In an aerospace conference given in Boston in 1966, engineer William E. Bradley, who developed the idea of cable-less man-machine manipulator systems for the US Defence Department’s Institute for Defence Analysis, stated his belief that man and machine would eventually be linked in such a way that by performing the manoeuvres himself, the man would cause them to take place, through the machine, at a distance of thousands of miles. This concept soon led to the weapon-aiming system devised by the Philco Corporation for the US Air Force, in which the pilot’s helmet is coupled by a servo-system that enables him to aim and fire his weapons automatically by merely swivelling his head until a camera located in his helmet shows the target.

Meanwhile, back on Earth, the sponsorship of the US Army and Navy had led to General Electric’s development of the exo-skeleton, or external skeleton, a ‘walking manipulator’ that gave its human wearer a ‘lifting capacity of three-quarters of a ton’ and could be used for heavy labour and underwater work. Once the operator stepped inside his hydraulically powered skeleton, a weight of 1,500 pounds would feel no heavier than 60 pounds and he could raise it six feet in as many seconds. When the man moved inside the skeleton, he looked like some kind of space-age monster.

By 1967, according to the 3 June issue of *Nature* magazine, an American Air Force scientist had taught people, himself included, to ‘think’ simple messages into a computer, using short and long bursts of alpha activity in a form of Morse code. When the computer reprinted what had been ‘thought’ into it, the first step had been taken in the ‘thought control’ of man-machine manipulators and advanced prosthetics. At approximately the same time, the scientists of many countries were experimenting with the control of myoelectric prosthetics with tiny sensors buried under the skin and capable of relaying EMG. (Electro-Miography) signals to an electronic circuit outside the body.

In the Neurological Prostheses Unit of Britain’s Medical Research Council, Professor G.S. Brindley was attempting to ‘implant electrode arrays in the brain which, when stimulated, might enable the patient to perceive sensations similar to those caused when lightwaves fall on the eye’ – in other words, to cure blindness. Also, by the mid-1960s corneal transplants were commonplace, as was the deep-freezing of blood to preserve it for years, and

the preservation and grafting of human skin. At approximately the same time work was racing ahead on the artificial larynx, lung, kidney, and heart, alongside the rapid development of miniaturized pacemakers and other sensors that could be implanted in the stomach, chest, or other areas under the skin. The discovery, in 1960, of 'acquired immunological tolerance' had already opened up the prospects for organ transplantation and now, thirty years on, the advances in this field are startling, if not always publicized.

Unconsciously indicating that the market for spare parts was about to expand, surgeons began to talk openly about the need to view persons suffering irreversible brain damage as an invaluable source of human organs. As Fishlock points out in *Man Modified*: 'Once the technical problems of transplantation are resolved, as is already the case with the kidney, the case purely on grounds of logic for regarding the unconscious cerebral cripple as a source of spare parts to be "cannibalized" may become overwhelming.' Fishlock also reminds us that many transplant surgeons had already expressed their belief that the most 'suitable and prolific' source of spare parts could come, ironically, from the most common 'mismatch' between man and machine – the young victims of automobile accidents, particularly those who die from brain damage. To this end, one London surgeon had even suggested having 'collection points' along motorways to 'harvest this valuable crop of bio-mechanisms'.

In a CIBA. Symposium on 'Ethics in Medical Progress' held in London in 1966, Dr Joseph Murray pointed out that the physiological requirements of space travel may have to be met with 'the grafting of accessory organs' such as extra adrenal glands and lungs. His view was supported by Dr Nathan S. Kline and Dr Manfred Clynes, both of the Rockland State Hospital in Orangeburg, New York, who insisted that the true conquest of space will only come when we 'equip man with exogenous components that would extend the self-regulating functions of the body far enough to adapt to a fresh environment'. In other words, a 'Cyborg'.

The astonishing surgical and bio-engineering advances mentioned above were all made before 1967. Since then, the transplanting of hearts, kidneys and other organs has become commonplace, the artificial womb has been created, natural skin can be grown in laboratories, plastic surgery has become an art form, sperm banks are big business, genetic engineering and cloning

have created a vast new industry, and computer intelligence has reached the point where there is genuine fear that it will soon start 'reproducing' itself and eventually break away from human control. Indeed, according to Ray Hammond in *The Modern Frankenstein: Fiction Becomes Fact* (1986) the interaction of man and machine is now so advanced that 'for practical purposes the "cyborg" is already here'.

If we assume that what we already know is only the tip of the iceberg, and that the bulk of the iceberg is hidden from view, we must accept that what is hidden from us by government and military scientists may be even more bizarre, and possibly more terrifying, than what has already been described. We should also bear in mind that the US Navy, Air Force, Army and government agencies such as NASA – all with top-secret research establishments in the White Sands Proving Ground and similar areas – have a particular need for advanced man-machine manipulators or cyborgs. Finally, we should note that if the necessary experiments are remotely like those performed openly, and described above, the moral, ethical, legal and theological ramifications would be enough to ensure that most of the work was performed in strict secrecy and, as with the UFOs, protected behind a smokescreen of official disinformation and ridicule.

Given these considerations, it is within the bounds of possibility that the small 'claw men' and creatures seemingly without eyes or mouths, as described by so many UFO contactees, could be cyborgs: half man, half machine – the result of decades of secret prosthetic experiments even more advanced that those mentioned above.

Theoretically, the lungs of such creatures would be partially collapsed and the blood in them artificially cooled. The cyborgs' respiration and other bodily functions would then be controlled cybernetically with artificial lungs and sensors which maintain constant temperature, metabolism and pressure, irrespective of external environmental fluctuations – thus, even if not protected by an antigravity (or gravitic) propulsion system, they would not be affected by the extraordinary accelerations and direction changes of their craft. The cyborgs would have no independent will, but could be remote-controlled, both physically and mentally, even across great distances, by computer-linked brain implants. Since this operation would render the mouth and nose superfluous, these would be sealed (possibly with the 'metallic' or 'wrinkled grey skin' coverings described by so many contactees) and

completely non-functioning.

To the mesmerized or terrified abductee, such unfortunate creatures would certainly look like ‘aliens’ or extraterrestrials.

On the understanding that research into the physical and mental mutation of human beings commenced as far back as the early 1960s and continues to this day behind closed doors, we can assume that the ‘secret’ work is even more advanced than the ‘known’ technology, which already includes genetic engineering and the cloning of life. If this is the case, it is possible that the UFOs and their ‘alien’ occupants – a mixture of normal humans and cyborgs – are members of a secret, Earth-bound society determined to pursue its research regardless of moral, ethical and religious considerations.

It is therefore possible that those abducted by UFOs are taken away for a variety of reasons: to undergo brain implantation and be returned to the real world as remote-controlled slaves who appear perfectly normal to those who know them; to be used as living subjects for even more advanced surgical, psychological and genetic experiments of the kind that would be morally unacceptable in normal society; or to be killed and used as a source of spare bodily parts for the cyborgs required by that society to work on the sea bed or in outer space.

This is not as far fetched as it may seem. Indeed, as shown in *The Human Body Shop: The Engineering and Marketing of Life* (1993) by Andrew Kimbrell, a host of startling new discoveries, including the cloning of life forms and fetal tissue transplants, has led to what amounts to ‘a new industrial age – a marketing revolution based on the manipulation and marketing of life’. This includes ‘the sale and manipulation of blood, organs, and fetal parts’; the marketing of ‘human reproductive materials – semen, eggs, embryos, and children’; and, finally, the ‘new biotechnology business of selling and engineering human biochemicals, genes and cells’.

As the human body is rapidly becoming no more than a ‘commodity’ in a ‘free market’, it is not beyond the bounds of possibility that a secret, totalitarian society, based on a highly advanced technology and the control of mind and body, could be abducting people to be used as more fodder for their on-going experimentation and ever broadening mind control.

In short, the ‘aliens’ who abduct humans in their UFOs may not be alien or extraterrestrial. Like the UFOs themselves, they could come from right

here on Earth.

Chapter 10

UFO Technology

Discussing the cinetheodolite photos taken at the White Sands Proving Ground in April and May of 1950, Captain Ruppelt notes: 'By putting a correction factor in the data gathered by the two cameras, they were able to calculate that the object was higher than 40,000 feet, traveling over 2,000 mph, and it was over 300 feet in diameter.' Ruppelt makes it clear that these figures were only estimates, based on the possibly erroneous correction factor. However, what they *did* prove is that the object had been solid and moving very fast through the air.

Those and other sighting estimates serve to remind us that many of the supposedly 'remarkable' speeds assessed from cinetheodolite data (and all too often taken as gospel by proponents of the extraterrestrial hypothesis) are inaccurate. In fact, many trained observers believe that the UFOs have lower, therefore more technologically feasible, speeds than they are widely credited with, though they are still craft of extraordinary capability.

In order to assess whether or not such craft could have been built right here on Earth, we first have to assess exactly what they are in relationship to the present technology. We know that by and large they are disk-shaped, but depending on the angle of view they can appear to be round, oval-shaped, spherical, or like a cylinder viewed from one end. Kenneth Arnold's momentous description of the horizontal flight of the UFOs being like 'a saucer would if you skipped it across the water' remains the most apt, since the UFO, with its central, non-revolving dome, certainly resembles either one plate placed upside down (dome on top) or two plates placed one upon the other, the top plate resting upside-down on the lower one (dome top and bottom). Analysis of the many sightings suggests that the standard UFO (there are exceptions) has a diameter about ten times its thickness. While attempts to judge the size of any object in high-speed flight are bound to be problematical, it is now widely accepted that the bonafide 'unidentifieds' range from diameters of two feet (which would be something like the

German remote-controlled *Feuerball*) to 300 feet (for which the only remote comparison with present aircraft is the Lockheed C-5A Galaxy heavy-logistics transport aircraft: wingspan nearly 223 feet; length nearly 248 feet.)

It is assumed that UFOs between one and three feet in diameter are remote-controlled sensing devices. They could in fact be highly complex Cybernetic Anthropomorphous Machine Systems (CAMS), either flying with their long axis vertical or flying in the direction of their axis. Controlled by Remote Manipulator Systems (RMS), not much different from the ones widely known, they would most likely be used for reconnaissance and basic manual tasks, such as the gathering of soil or plant samples. The larger (but still relatively small) UFOs of between six to fifteen feet in diameter are, depending on size, either remote-controlled or single-pilot craft, used for more complex reconnaissance and collection purposes. The 'standard' model, about twenty-five to thirty-five feet in diameter, would be more like a jet fighter, with defensive or attack capabilities. This model revolves around its axis, and is piloted either by human pilots, by the kind of cyborgs described in the previous chapter, or by a combination of both.

The large UFO, from about 100 feet to 300 feet in diameter and two or three stories tall inside, would be the equivalent of the above mentioned Lockheed C-5A Galaxy heavy-logistics transport aircraft, though even more spacious, with many crew members, and probably used as a transport and refuelling craft.

Whether or not such a craft as a 'command' or 'mother' ship actually exists is a matter of pure speculation; but those reported have been as much as a mile in diameter and were seen to discharge and receive the smaller UFOs, often in large numbers. If they exist, they could be self-generating airborne colonies, capable of drifting in outer space or of hibernating on the sea bed, manned by a large crew of humans and cyborgs, the heavy labour performed by 'programd' slaves or CAMS. If this were the case, they would contain accommodations, workshops, laboratories, medical quarters, cryonics preservation units, various hangars, and a selection of the other, smaller disks.

The exterior surface of the UFOs is invariably described as smooth and seamless. When doors open, they usually do so in the side, sometimes falling down like ramps, or in the base, like trapdoors; but in the former instance, once the door closes again, no joins or dividing lines can be seen. It is not

known what the composition of the UFO's structure is, but it is usually described as metallic, aluminium, chrome, silvery, shiny, whitish-grey, or white. The surface, no matter the colour, sometimes has a soft glowing or luminous aura around it, while in other cases the 'aura' is blinding white, dazzling, intensely luminous, or like burning magnesium. Multicolored lights are often described, sometimes flashing simultaneously, sometimes sequentially, but these appear to be separate lights, emitting from specific parts of the craft. They are not produced by the composition of its surface material.

The colours suggest an exterior surface made from some kind of metal. For instance, the bright aluminum surfaces of an airliner, when viewed under an overcast sky or through atmospheric haze, will take on a dull grey, or even dark grey, appearance.

Nuclear physicist James M. McCampbell, whose speciality is planning and managing large-scale projects involving advanced technologies, is the author of *Ufology* (1976), the only book devoted solely to the physical nature of UFOs. In it he says: 'Some hints as to the actual metal of UFOs might be inferred from the properties required by their flight characteristics and mode of propulsion. These include lightness, strength and resistance to heat. McCampbell believes that the metal would have to be composed of elements that are already known, even if 'technological superiority may be evidenced by unusual purity or new mixtures and crystal structures'. He proposes magnesium and titanium.

This is interesting in that one of the most extraordinary metals now in existence is Nitinol, described by *Science Now* as 'the magic metal' because, though a simple, light alloy of nickel and titanium, it possesses properties that have perplexed the most knowledgeable minds in metallurgy for nearly thirty years. Nitinol is 'a metal with a memory' that can be made to remember any shape it is bent into and will always return to it after being heated. Nitinol also has the ability to 'learn' and if heated and crumpled enough times will not only remember its original shape but gradually 'learn' to remember its crumpled form as well. The aerospace industry has been using this 'magic metal' for years. In the words of *Science Now* (No.2): 'The speed and reliability of Nitinol's shape-changing response, the metal's lightness and its total resistance to metal fatigue make it an invaluable material for use in spacecraft.'

Dr James Harder, in his article ‘Looking at the Evidence’, published in *Worlds Beyond* (1978), claims that a piece of metal shot off a UFO over Washington in 1962 was found to be ‘magnesium orthosilicate, with some tiny round occlusions’; another fragment recovered in Sweden was ‘a chunk of tungsten carbide, one of the hardest metals known, next to the diamond’; and some fragments found in Brazil were of ‘ultrapure’ magnesium. Harder also points out that abductees taken aboard UFOs invariably describe the floor as being ‘very hard and cold’ and the materials they encounter ‘metallic or hard plastic’. Other than that, it is certainly worth recalling that the ‘tiny round occlusions' found in the magnesium orthosicilate suggest some form of porous metal, or *Luftschwamm*, which was, as we now know, a mixture of magnesium and aluminium.

The use of a porous metal with high heat resistance and a composition that charges the air around it could account for UFO speed and lack of noise. James M. McCampbell believes that the presence of a UFO in flight must be ‘telegraphed’ ahead to the gas molecules in the air; a force exerted by it then moves the molecules out of the way, and, after passage of the UFO, the air closes in behind it. By such means ‘the UFO could slip through the atmosphere with little expenditure of energy and no shock wave would be created on its leading edge’. It is McCampbell’s belief that the plasma on the surface of the UFO, or the radiant energy that stimulates it, is responsible for this. He points out that as early as 1968, the Northrop Corporation was reportedly experimenting with electromagnetic fields to ‘modify the air stream around supersonic aircraft to prevent shock waves’. It is also reported that by 1976 the North American Rockwell Company, under US Air Force sponsorship, had developed a radar-absorbing material composed of ‘advanced structural plastics’ and possessing ‘special electrical properties’. The material had been created not only to make aircraft lighter, but to make them ‘invisible’ to enemy radar.

A contemporary example of this attribute can be found in the F-117a Nighthawk, or Stealth night-fighter, which has often been mistaken for a UFO because of its appearance and capabilities. First test-flown on 18 June 1981, but kept secret from the public until 1989, the Stealth is a Delta-wing aircraft with a pyramidal structure that gives it a flying saucer appearance when viewed from most angles. With a wingspan of 43 feet 4 inches and a length of 65 feet 11 inches, the F-117a Nighthawk is powered by two General

Electric turbofans, armed with two laser-guided smart-bombs, has a low radar profile in flight and, because of its exceptional streamlining, makes little noise. Painted stark black with a special anti-radar paint, the F-117a Stealth is as near to an ‘invisible’ supersonic aircraft as it is possible to imagine within the known technology. However, as the authorities have finally let it be shown to the public, after years of denials regarding its very existence, it has almost certainly been superseded.

Its successor is possibly the Aurora - an officially non-existent supersonic aircraft often seen flying over Scotland and its off-shore waters. Invariably described as big, black and triangular, with no wing surfaces or tail surfaces, two thirds the size of the Stealth night-fighter (which would make it about ninety feet long), the Aurora is possibly radar invisible (at least its presence in the skies has been denied by all radar operatives under its flight path) and witnesses have reported that it makes no noise when in flight.

This mysterious, supersonic, silent aircraft, recorded as flying as fast as 6 Mach, is most frequently sighted in the vicinity of RAF Machrihanish, located on the tip of the Mull of Kintyre. Jointly owned by the United States, RAF Machrihanish is one of the most secret NATO air bases in Europe.

The Pentagon, which for years denied the existence of the F-117a Nighthawk, is now insisting that the Aurora does not exist.

The UFO’s ability to ‘just disappear’ or ‘blink out like a light bulb’ is often attributed to its extraordinary speed (which is certainly one cause, as we shall see), but it may also be related to its oddly ‘glowing’ colours. Another form of apparent ‘invisibility’ is that many UFOs, while not seen by those who have accidentally photographed them, have shown up mysteriously on developed film.

With regard to this apparent ‘invisibility’, official analysis of the photographs taken of the Lubbock lights during the famous sighting of August 1951 revealed that what the photographer had picked up was an exceptionally bright light source which had a colour at the most distant red end of the spectrum. This suggests that it was infrared - or something similar to infrared - which in turn means that the object would be dim to the human eye but bright on the photograph.

Let us take this hypothesis further by going beyond the known spectrum. If the UFO could produce such light, and do so at will, it would in effect be

capable of materializing and disappearing in the wink of an eye, even when *not* moving fast. As previously noted, the UFOs are usually described as being surrounded by glowing colours: blue, green, yellow, orange, red. Assuming that they are constructed with a metal composed of already known elements - possibly of unusual purity and radical mixtures - we can also assume that what we are *not* dealing with is a magical metal that can actually transmit light.

As electrical discharges of unusual strength will sometimes lead to a soft, white glow, a corona, near high-voltage transmission lines, it can be assumed that they have either some sort of negative potential that causes electrons to leak into the atmosphere surrounding it, an alternating potential that agitates gas atoms in the surrounding atmosphere to their ionization potential, or even an alternating current within the UFO's own shell which draws radiant energy from the surrounding atmosphere. This would account for a white glow.

However, let us assume that the UFO's luminosity is not caused by an unknown composition, but by the natural air closely surrounding it. If atoms are sufficiently agitated by the absorption of electromagnetic radiation, a few of their electrons will be elevated out of their normal orbits, or possibly removed from the atom completely; then, as more electrons fall back in these empty spaces, a certain amount of energy will be released and radiated away as photons. Within the visible region, a stream of such photons having the same wavelength and frequency will be seen by the human eye as an unusual, glowing colour, ranging all the way from violet to red. This is a form of electromagnetic radiation - and unusual traces of electromagnetic radiation have often been found upon examination of reported landing sites.

As the magnetic field in interstellar space is extraordinarily weak, we can assume that the UFO, which certainly leave Earth's atmosphere on occasion, would not be using electromagnetic propulsion and that the traces of electromagnetism found after so many sightings are related solely to the craft's composition. Assuming, therefore, that the UFO is made of some exceptionally pure composition of metals - say, aluminium, magnesium, titanium or strontium - and that the material is electronically charged, the UFO would often appear to be white or silvery up close, a dull or dark grey when viewed through atmospheric haze, and just as often be surrounded by a glowing halo of various colours. If such a craft also had the capability of

creating a colour source beyond the known spectrum and turning it on and off at will - it could be dim, or even invisible, to the human eye, show up on normal film, and yet materialize in our visible spectrum as required.

This may have been the case with the UFO sighted over Lubbock in August 1951 - as well as in many similar sightings. It may also explain the relative ‘invisibility’ and ‘silence’ of the Aurora, presently being sighted by so many, even as the Pentagon insists that it does not exist.

Though the ‘glowing’ colours indicate an unusual composition of otherwise known materials, they could also be indicative of the UFO’s mysterious propulsion system. UFOs have unusual and remarkable flight characteristics, including the ability to hang nearly motionless in the sky, settle gently on the ground, rise vertically, and make sharp, right-angled turns. Such manoeuvring capabilities, combined with the absence of air blasts, smoke and sonic booms, indicates that they are certainly not propelled by orthodox engines or rockets.

In a declassified, formerly secret Department of the Army Intelligence Memorandum, dated 21 January 1948, information was requested on various possible propulsion systems for ‘oval, disk, or saucer-shaped aircraft’. Among the systems to be investigated were ‘jet propulsion engines including turbo jets, rockets, ram-jets, pulse jets, or a combination of all four’. Nuclear propulsion (atomic energy) was also to be investigated on the grounds that ‘atomic energy engines would probably be unlike any familiar type of engine, although atomic energy might be employed in combination with any of the above types’. How the UFOs are propelled remains a mystery, but it is known that since that Memorandum was written and distributed, many experiments have taken place in advanced ion propulsion, electromagnetic and microwave propulsion, in certain cases nuclear fusion pulse rockets, and even antigravity, or gravitic, propulsion.

Ionization and electromagnetic discharges could be another cause of the plasma-like glowing that so fascinates UFO witnesses; the use of an anti-gravity shield, or gravitic propulsion, could account for the UFO's lack of turbulence and sonic booms.

McCampbell reminds us that according to technical analysis, the lift-off of the average UFO would require as much energy as the detonation of an atomic bomb, would cause the body of the UFO to heat up to about

85,000°C, and would naturally lead to intense deposits of radioactivity (often found on or near UFO landing sites). However, with an antigravity shield reducing the mass of the UFO to almost zero, it would require only a modest force to reach exceptionally high accelerations.

The UFO does not defeat gravity entirely. If it did so, it would continue to float upward into the atmosphere, instead of hanging motionless in the sky. Nevertheless, it must *almost* defeat gravity and could therefore be using some form of gravitic protection, or propulsion.

How would this work?

Gravity is the force that draws all bodies in Earth's sphere toward the centre of the planet. Where gravity exists, so does the inertial force, which is 'proportional and directionally opposite to the accelerating force'. According to Einstein's principal of equivalence, it is not possible to distinguish between the two: gravitational mass and inertial mass are, to all intents and purposes, identical. This being the case, if we manage to nullify the effect of gravity on a certain mass, we will also nullify the inertial mass that would normally act against it. So if we activate a so-called gravity 'shield' around our UFO, thus reducing its mass respecting gravity and the inertial force to almost zero, we will produce what McCampbell has termed 'neutral buoyancy' in the atmosphere.

Very modest forces exerted upon this virtually massless UFO would produce extremely high accelerations. In fact, a vehicle so shielded could accelerate out of sight faster than the human eye can see' Also, by applying 'a small force in the direction of flight', the gravity-shielded vehicle could be brought to an abrupt halt; while 'applying the force traversely would produce astonishing, sharp, nearly right-angle turns'.

As the inertial mass of such a craft would decrease the higher it goes, we can assume that such a mass would be reduced to nearly zero by the time it reached the limits of Earth's atmosphere. This could be the explanation for the UFO's widely reported 'two-stage' take-off: a slow rise to a hundred feet or so, then a sudden acceleration and disappearance. Finally, since the UFO's performance is related directly to Earth's gravity, and as the pull of gravity varies slightly from place to place, the UFO in horizontal flight would often appear to rise and fall slightly: the increase and decrease of gravitational pull would effect its inertial mass and makes it 'wobble' or bob up and down. This would also explain why the UFO appears to be able to follow the profile

of the terrain below it automatically.

An antigravity shield would certainly account for the UFO crews' apparent ability to withstand the extraordinary speed and direction changes of the machines. As the inertial mass is also nullified, the gravity-force would apply simultaneously to the crew *and* the UFO; as it provides a cushion of air around the saucer, it also prevents the UFO from heating up.

Antigravity, or gravitic propulsion, is not as revolutionary as it sounds. As far back as 1965, when UFO sightings over secret military bases were at their peak, there were at least forty-six unclassified G-projects being undertaken in the US alone - by the Air Force, the Navy, the Army, NASA, the Atomic Energy Commission, and the National Science Foundation. Given that these were only the unclassified projects, considerably more advanced projects could have been completed in any one of the top security research establishments, including those scattered throughout the White Sands Proving Ground.

Nuclear physicist Stanton T. Friedman has made the point that since you do not need right-angle turns and hovering capabilities when you are in interstellar space, there may be different kinds of, or a combination of, UFO propulsion systems. A gravitic propulsion system would undoubtedly make sense for flight within the pull of Earth's gravity; but for interstellar flight (assuming the UFOs make such flights), staged fission or fusion-propulsion systems would do the job. As someone who worked on both systems for General Electric and others, Friedman is able to point out that by 1978 the most powerful nuclear reactor to be tested in the Free World was the Phoebus 2-B nuclear-reactor rocket-propulsion system built by the Los Alamos Scientific Laboratory. That system, which operated at a power level of forty-four hundred million watts - twice the output of the Grand Coulee Dam - was under six feet in diameter.

According to Friedman, fusion is even more exciting. 'If you use the fusion process properly, you can kick particles out of the back end of a rocket that have *ten million* times as much energy per particle as they can get in a chemical rocket.' With relevance to the enormous power of fusion being packed into the relatively small confines of a UFO, Friedman reminds us that a quasar represents the energy of a galaxy in something the size of a single star; and that when we moved from the atomic to the nuclear world, we 'went

down in size and way up in energy per particle'. Thus, when we go down from the nuclear world to the subnuclear world (which we are now doing), we will 'go down in size again and up in energy again'. In other words, fusion will present us with a form of enormous power that can be contained in minute housing.

'Fusion is something we know about,' Friedman says. 'H-bombs are fusion devices; the Sun is a fusion factory... We know how to do it.'

Friedman also suggests in his article 'Flying Saucers Are Real' (1978) that a propulsion system based on the ionization of the air could solve all the problems of high-speed flight. 'About ten years ago, an electromagnetic submarine was built in California. I believe you could build an analogous airborne system where you create an electrical conducting fluid, similar to the seawater around the submarine, by ionizing the air.' With ionized air, as opposed to 'neutral' air, it would be possible to interact with the electrically conducting fluid, or the electric and magnetic fields, thereby reducing heating and drag, increasing lift, and eliminating sonic boom.

According to Friedman, the UFO's frequent changes in colour, extraordinary flight characteristics, and absence of noise indicate the presence of ionized air and high magnetic fields. While he leans toward the extraterrestrial hypothesis, he does believe that 'there are a number of professional people working at a secret project, using the data input from the Aerospace Defence Command and others, trying their darnest to build a flying saucer'.

The 'spinning' of the UFO could be an integral part of its propulsion system. The only time a UFO does *not* spin is when it is resting on the ground. In most reports the UFO starts spinning as it lifts off the ground, with the rotations becoming faster as it ascends. In some cases, the whole UFO spins; in others, the outer rings spin around a fixed cockpit or central dome. According to McCampbell: 'It is easy to imagine that rotation of the entire vehicle, or a major component, would be used to achieve stability in the air; that is, to maintain the axis of rotation in a constant direction due to the angular momentum.' Clearly, since the passengers, or crew, could not be subjected to the rotation of the outer surface of the vehicle, the interior portions of the UFO would be uncoupled from the exterior and we can thus think of the craft as operating like a gigantic gyroscope.

Regarding this, Renato Vesco tells us that in 1945, along with reports of ‘constant-velocity airfoils, one with an elegant two-pointed meniscus shape and the other with a curious if not monstrous-looking mushroom shape’, there were leaks about the construction of an experimental ‘independent, gyroscopically stabilized cabin’ that was ‘ringed with a rotating organ of large dimensions, as in the Italian-German projectiles and the Fireballs, involving the need for autonomous and automatic stabilization’. At that time, the US National Physical Laboratory's division of applied physics was investigating the ‘direct gyroscopic stabilization’ research material of the captured Kreiselgeräte GmbH, located in Berlin Britz. That company (now liquidated) was so-called because it had designed and constructed the Kreiselgeräte: a mechanism that could reduce the oscillations of a violently shaking body to under one-tenth of a degree. Such a device, if applied to a fixed central cupola, or dome, placed within a rotating circular wing, or disk, would, at least in theory, have supported the often reported view that ‘seen from below, the UFO seemed to spin rapidly on its own axis, except for the central part, which appeared to be stationary’.

Reports indicate the presence of strong gusts of hot or cold air as the UFO descends, ascends, sweeps past, or passes overhead. The currents are often strong enough to bowl people over, bend trees, make grass and plants flutter wildly, and suck snow, water, sand, and loose materials up into the air. On odd occasions, trucks and cars have almost been lifted off the road by a UFO passing over overhead. According to McCampbell, the UFO can not only lift vehicles off the road, but ‘seems to impart a torque, or turning force to them, as confirmed by the spinning and swirling of other objects’. This phenomenon shows that the unknown force ‘prevails within a cylindrical zone having the same diameter as the UFO and extending from it to the ground’. What is most puzzling about this force is that instead of acting downward, as would be the case with jet exhausts, it acts upward, thus causing rotation to the objects affected. The force is also selective in what it affects, favouring electrical conductivity as a ‘responsive item’. Thus, stone or dry sticks are not so affected (unless wet); the human or animal body, metals, and water are. This suggests that the UFO may indeed be defeating gravity in some manner and, if so, is sharing this achievement with the ‘responsive items’ directly below it, which in turns suggests ‘gravity damping by electromagnetic radiation’.

More support for the presence of electromagnetic radiation comes from the charred grass and plants often found where UFOs have landed. As the roots of grass so affected are charred, but the blades are not damaged, it is possible that we are dealing with induction heating from a 'powerful, alternating magnetic field'. This offers the possibility of microwave propulsion. McCampbell points out that electromagnetic energy in the range of about 300 to 3000 MHz or higher seems to be responsible for stimulating coloured halos around the UFOs; producing a dazzling, white plasma on the vehicle's surface; turning off automobile headlights and stopping internal combustion engines; precipitating wild gyrations of compasses and magnetic speedometers; interfering with radio and television reception; disrupting transmission of electrical power; charring or calcining grass roots, insects and wooden objects; heating bituminous highways to the point of flame-up; heating the human body internally and causing people to feel electrical shocks; and inducing temporary paralysis in witnesses. Medical experiments have also shown that when pulsed at a low audio frequency, electromagnetic energy is capable of stimulating a humming or buzzing sound in the human ear - one of the few sounds attributable to UFOs.

In summary, the microwave energy radiating from UFOs may be an integral part of a propulsion system that is capable of greatly diminishing gravitational and inertial forces, furnishes the required thrust for acceleration, and moves air out of the flight path to minimize drag, shock waves and sonic boom. While such a system may be well in advance of the *known* technology, McCampbell is of the opinion: 'It does not appear to be so far distant that a well-organized and adequately funded research program could not make it available to humanity.'

Stories of contactees being mesmerized or temporarily paralysed by 'beams of light' or unfamiliar sounds (including the 'humming' or 'buzzing') emanating from UFOs are common. While such stories seem uncomfortably close to science fiction, they could be perfectly true. Lasers can concentrate high energies in narrow beams, have extremely pure colours, and produce well-ordered, regular light-waves - just like the beams of light emanating from UFOs. Also, it is now well established that under certain conditions light and sound can have extraordinary mental *and* physical effects on normal, healthy people.

For instance, a light flickering somewhere in the alpha-rhythm range, between eight and twelve cycles per second, can cause extremely violent reactions in the person exposed to it, including jerking limbs, faintness, lightness in the head, or unconsciousness. It is therefore possible that the mysterious beams of light described by so many contactees are strobe lights or laser beams which flicker on and off at the particular rate which affects the brain's basic rhythmic patterns and place the subject into a hypnotic trance. As for the strange humming, buzzing or 'vibrating' sounds which also appear to affect the contactees, laboratory tests have revealed that infrasounds, which are just below the limit of human hearing (thus making the listener imagine that he is *feeling* the sound, like a 'vibration') can affect humans in the same way as flickering lights: either hypnotizing them, stunning them, rendering them unconscious, or paralysing them while leaving them fully conscious.

Certain low frequency sounds can lead not only to a change in the brain's rhythmic patterns, but to actual physical changes, such as the breaking of glass, the deadening of ignition systems (also caused by electromagnetic energy, as explained above), and even the killing of human beings or animals, when their innards are crushed by pure vibration. Given that this is so, it seems perfectly feasible that the UFO's flickering beams of light, or laser beams, when combined with infrasounds, could have led to many cases of contactee hypnosis.

According to McCampbell, a weapon similar to the immobilizing lights used by the UFOs may have been developed during the 1960s by the Federal Aviation Agency under the direction of Dr H.L. Reighard. The purpose of this 'high-frequency radiation' weapon was to counter aeroplane hijacking, but the device was never used because of the dangers it might present if used inside an aircraft. In the same field, John Cover, a scientist in Newport Beach, California, developed the 'taser', which is a ray gun that passes an alternating current of 30/40 milli-amps through the body, temporarily freezing the skeletal muscles with no lasting adverse affects.

While much of the laser experimentation is top-secret, it is known that as far back as the 1950s the US Air Force was watching and photographing the secret Soviet laboratory at Semipalatinsk, where the Russians were known to be developing an extremely powerful 'beam weapon' capable of destroying intercontinental missiles at almost the speed of light. It was suspected that the beam comprised atomic or sub-atomic particles - electrons, protons or ions -

equivalent to billions of volts of electricity and accelerated toward the target at just under 180,000 miles per second. John Allen, senior US government scientist, stated that a weapon of this type appeared to be a distinct possibility; and both George J. Keegan, head of USAF intelligence, and Dr Willard Bennett, member of the US team that was obliged to abandon beam weapon work in 1972, believed that the Russians were well ahead of the Americans in this field.

So what, precisely, is a laser?

The acronym ‘laser’ is short for ‘Light Amplification by Stimulated Emission of Radiation’. The laser ‘stimulates’ radiation when it ‘pumps’ energy into some material in a way that causes large numbers of its electrons to become precariously balanced at a high energy level, then drop back to their normal or ‘ground’ state. As each electron drops back, it gives up its excess energy by throwing out a ‘packet’ of radiation - a photon. The resultant energy gap between the upper, or ‘balanced’, and the ground, or ‘normal’, energy states, gives a particular frequency to the photon radiation emitted. When this particular form of radiation then falls on an energised atom, it ‘stimulates’ it into emitting its own photon, with each photon then stimulating more energised atoms in a perpetual chain reaction. The visual result is a beam of light formed when the ‘surge’ of light built up in the laser is reflected back and forth between precisely spaced mirrors. If one of the mirrors is partly transparent, an intense output beam can escape to form a visible, often dazzling laser beam.

But could secret laser research account for the affects of the ‘beams of light’ described by so many UFO contactees?

It is common knowledge in the West that unclassified laser technology has reached a state of advancement that once was only imagined by science fiction writers. In fact, laser technology has been on the agenda for almost four decades, with the first lasers demonstrated in 1960. Though these early demonstrations made the concept of the ‘death ray’ respectable, many scientists of the time refused to believe in their potential either for death-dealing or for other equally devastating applications. The laser arms race, however, accelerated at remarkable speed, producing ever more varied and powerful beams - electrical discharges, lightning flashes, neutron flux from a nuclear reactor - culminating in the most powerful of all laser weapons: carbon dioxide lasers with outputs in the megawatt range. These emit

invisible infrared radiation, though the beam is highly visible as a row of sparks like tiny lightning bolts. Their capabilities are still a matter of dispute, but it is known that as far back as 1980 such laser beams could destroy a small anti-tank missile at a range of one kilometre and that other laser beams were being fired at aircraft or in orbit during top-secret tests. According to published reports those first trials produced no spectacular results, but an official British study predicted that by 1995 anti-aircraft, anti-satellite and possibly even hand-held lasers would be in 'routine' use as weapons and for other, more productive uses, such as bloodless surgery.

At the time of writing (1994), serious research is being conducted regarding the possibilities of the gamma-ray laser, or graser. According to reports, while 'known' (ie., non-secret) technology presently lacks the controlled power required to pump a gamma-ray laser, such a weapon, whether created secretly or in the future, would be: 'a true death ray, horrifyingly powerful'.

While we cannot know what is going on behind the closed doors of our top-secret research facilities, we do know that the US Space Command, for example, has for years been seriously involved in a 'Star Wars' program that views laser-equipped satellites as a viable, and vitally necessary, weapon of the future. Despite the initial doubts of certain scientists, over the past two decades the major powers, notably Great Britain, Russia (formerly the Soviet Union) and the United States, have been pursuing this technology. As long as arms negotiators cannot agree to ban anti-satellite and laser weapons, this race will continue, with startling advances being made - for good and for ill.

Certainly, at the time of writing, laser beams are being developed not only as future weapons of war, but also for use in surgery, chemistry, biology, engineering, and nuclear fusion control. They are also being researched as potential mesmerising or immobilizing devices. It seems, then, that the laser-beam weapons reportedly used by UFOs as paralysing or more destructive weapons are not beyond the reach of the present technology. On the assumption, therefore, that the classified, or unknown, technological achievements must always be far ahead of known technology, the capabilities and characteristics of the UFOs do not place them beyond the possibility of Earthly origin.

Chapter 11

-

Speculations on Terrestrial UFO Bases

UFOs are often reported to appear from, and depart toward, the sea. Given the relatively limited number of people traveling by sea, it is surprising that so many reports have concerned UFOs diving into or erupting from oceans all around the world, in areas such as the Bermuda Triangle, in the West Atlantic, connecting Bermuda, Puerto Rico and the coast of Florida; the so-called ‘Devil's Sea’ bounded by the southeast coast of Japan, the northern tip of Luzon, in the Philippines, and Guam; the coastal waters of Argentina, particularly near Plata del Mar; and the Great Lakes of Canada - all of which are also known as areas where many aircraft and ships mysteriously disappear without trace. This has led to much speculation about the possibility of USOs (Unidentified Submarine Objects) hiding on the sea bed, or of undersea laboratories which are visited frequently by UFOs.

Of the regions mentioned above, the Bermuda Triangle is the most notorious. Its reputation as a ‘Devil’s Triangle’ (not to be confused with the ‘Devil’s Sea’ mentioned above) really began on 5 December 1945, with what has since become widely known as the mystery of Flight 19. Months after the end of World War II, five US Navy aircraft vanished without a trace when on a routine training mission out of Fort Lauderdale Naval Air Base. Reportedly the control tower received some very strange, panicky messages from the flight leader just before the five planes disappeared. These included the words: ‘We seem to be off course, we cannot see land... we are not sure of our position... everything is wrong, strange... even the sea doesn’t look as it should... it looks like we’re entering...’ According to legend, the voice was then cut off, the planes and their crew vanished without trace, and the mystery was only deepened when, a few hours later, an aircraft participating in the search operation also vanished without trace.

It later became clear that no such words had been received by the control tower, that the air crews were inexperienced and in error about their course, and that the five planes probably crashed, with the crews and debris swept away beyond recovery. Nevertheless, the case of Flight 19 was soon turned

into a major mystery and the area gained the reputation for being responsible for hundreds of similar, inexplicable disappearances. Reportedly they were often preceded by terrified radio messages about weird fogs, an equally weird or 'different' sea or sky, pulsating lights, strange cloud formations, unaccountable loss of power in the ship or aircraft, and the aberrant behaviour of radar and other electrical equipment.

The 7th District Coast Guard has always maintained that the high degree of ship and aircraft disappearances in the Bermuda Triangle are due to three major factors: it is one of the busiest air and sea routes in the world;, the air and sea traffic includes thousands of private pilots and boat owners, many of whom are dangerously inexperienced; and the region is prone to sudden, dramatic changes in weather. The fact that many of the ships and aircraft disappear 'without a trace' is due to the Gulf Stream, which moves so fast that it can carry a disabled ship miles off course and disperse wreckage over a vast area in a very short time.

Nevertheless, if most of the disappearances can be accounted for, the area still has some unusual characteristics, including unexplained regional magnetic aberrations, shining or pulsating lights in the night sky or beneath the sea (possibly 'white water'), the often reported 'glowing fogs' and 'boiling clouds', and an unusually high incidence of UFO, or USO, sightings. Of particular interest in this respect is the fact that the 'white water' often found in the area is reported to contain unusual chemical properties, including sulphur, strontium and lithium, which have also been found in analyzed pieces of supposed UFO debris.

Charles Berlitz, author of *Without a Trace* (1978), makes an interesting connection between the Bermuda Triangle, or Devil's Triangle, and the Devil's Sea at the other side of the world: 'They both are located approximately between 20° and 35° north latitude, and the 130° east meridian runs approximately through its centre. This same meridian, when it crosses the North Pole, becomes 50° west longitude and runs through the eastern section of the Bermuda Triangle. Berlitz also points out that both areas are crossed by the Earth's agonic lines (lines with no magnetic variation, along which the magnetic needle points directly north *and* south) and suggests from this curiosity that electromagnetic forces may have much to do with the strange phenomena in both areas.

Because the Bermuda Triangle's known magnetic aberrations are

combined with a high incidence of UFO or USO sightings, there are many who believe that the missing ships, aircraft and crew members are somehow being 'abducted' by gigantic USOs that may emerge from, and return to, the sea bed. Dr Manson Valentine, former curator honoris of the Museum of Science in Miami and research associate of the Bishop Museum of Honolulu, believed that the disappearances within the Bermuda Triangle were due to fields of ionization created by the propulsion systems of UFOs, which could possibly change the molecular structure of ships, aircraft or people who strayed accidentally into their path or wake. Whether the cause of the disappearances is due to abduction or dematerialization, the widespread belief is that the Bermuda Triangle and other bodies of water like it hide USOs, or USO bases or laboratories.

Given UFO technology, this just might be possible. If such laboratories exist, they could be manned permanently by cyborgs or 'programd' human beings who would not be affected adversely, either physically or psychologically, by their undersea prison. As for the actual construction of laboratories at such depths, if, as reported, the 'mother' ships are up to a mile in diameter, they could simply settle onto the sea bed and the laboratory would then be constructed, or deposited, there with the aid of specially reinforced, remote-controlled CAMS. The UFO, or USO, would then ascend to the surface again, leaving the reinforced laboratory down there, complete with its crew.

Telechirics, or advanced man-machine manipulators, have already been used extensively on the sea bed. As far back as 1962, the Hughes Aircraft Corporation developed the Mobot, a complex 'swimming socket wrench' designed for Shell to complete the assembly of underwater oil well-heads. The Mobot had television 'eyes' and sonar 'ears' and was capable of wire-brushing surfaces and turning valves on and off at a depth of 1,000 feet. It was superseded by the even more ingenious UNOMO, a 'universal underwater mobot' that had four arms - two for work and two for hanging on to the well-head. That was nearly thirty years ago. Since then, within the *known* technology, manned descent to the deepest undersea point (35,800 feet) has been made, huge saturation diving complexes are already on the sea bed, and 'submarine homes' and 'floating islands' (contained within sea domes) have come onto the agenda. It is therefore possible, given the estimated technology of the UFOs, that they would be capable of at least

exploring, or settling upon, the sea bed.

Returning to dry land, the question of UFO bases has led to much wild speculation. It is clear that a great deal of UFO activity has taken place over military establishments, such as those scattered throughout the White Sands Proving Ground, and that many people think it possible that crashed UFO debris, and possibly dead occupants, are being preserved in guarded hangars on various Air Force bases. Nevertheless, if the presence of UFOs is felt most strongly on or near military establishments, the sheer number of sightings indicates that they are being mass produced and maintained in one or more top-secret, isolated locations.

It is the belief of Renato Vesco that one of the most likely locations for a hidden UFO base is the vast, mountainous, wooded region of southwest Canada, on the boundary between British Columbia and Alberta, bordering the state of Washington on the south. One of his reasons for this belief is that A.V. Roe Canada Limited (AVRO-Canada, since closed down) in Malton, Ontario, was responsible for the saucer-shaped Avrocar, or Omega, at a time when Canada was regarded as 'the Promised Land of Aviation' (J.H. Stevens) and 'among the greatest aeronautical powers in the world' (N.S. Currey), including, apart from AVRO, its fellow giants Canadair and De Havilland. Vesco supports his theory with the factually accurate contention that in the sightings that began the modern UFO era - the Kenneth Arnold and Maury Island sightings of 1947 - the UFOs were observed over Washington State and flew away in the direction of the Canadian border. It is also a fact that analysis of the UFO wave that preceded the famous UFO 'invasion' of Washington DC in 1952 revealed that the UFOs had advanced steadily on the capital from the direction of the Canadian border. The same has been true for many of the other American sightings.

The second most likely location for man-made saucers is in a sense the most unlikely, since it is inextricably entwined with 'hollow Earth' theories. Ironically, this idea, which had been around for centuries, became concrete for contemporary UFOlogists through aerial photos released in all innocence by an official US government body.

In early 1970 the Environmental Science Service Administration of the US Department of Commerce released to the press photographs of the North Pole

that had been taken by the ESSA-7 satellite on 23 November 1968. One of the photographs showed the North Pole wreathed in its customary cloud cover; the other, showing the same area without cloud cover, revealed an enormous black hole where the Pole should have been

Little did the Environmental Science Service Administration know that their routine weather reconnaissance photographs would lead to one of the most sensational and highly publicized controversies in UFO history.

In the June 1970 issue of *Flying Saucers* magazine, editor Ray Palmer reproduced the ESSA-7 satellite photographs with an accompanying article that claimed that the enormous hole shown on one of the photographs was real.

It had long been the belief of Ray Palmer and a great many other UFOlogists that the Earth is hollow, and that the UFOs emerge from and return to a civilization of superior beings that is hidden in the Earth's unexplored interior. Now, with an 'official' photograph of an enormous black hole at the North Pole, Palmer was able to assert that his subterranean super race probably existed and could most likely be reached through the holes at the North and South Poles.

According to Palmer, the ESSA-7 satellite photographs were proof that an enormous hole existed at least at the North Pole; and in subsequent issues of *Flying Saucers* he strengthened his case by resurrecting another long-standing 'hollow Earth' controversy: the famous expeditions of Rear-Admiral Richard E. Byrd to the North and South Poles.

Rear-Admiral Richard E. Byrd (1888-1957) of the US Navy was a distinguished pioneer aviator and polar explorer who flew over the North Pole on 9 May 1926, and then led numerous exploratory expeditions to the Antarctic, including a flight over the South Pole on 29 November 1929. From 1946 to 1947, he led the full-scale Operation Highjump, which was reported to have discovered and mapped 537,000 square miles (1,390,000 kilometres) of Antarctic territory. Just before his death, in 1957, he directed the 1955-1958 Antarctic expedition as a contribution to the International Geophysical Year.

Byrd's most famous polar expeditions were first drawn into the hollow Earth controversy when numerous articles and books - notably *Worlds Beyond the Poles* (1959) by Amadeo Giannini and *The Hollow Earth* (1969) by Dr Raymond Bernard - claimed that Byrd had actually flown, not *across*

the North and South Poles, but *down* into the great hollows that led into the Earth's interior. Ray Palmer, quoting extensively from Giannini's book (as, subsequently, did Dr Bernard), introduced this theory in the December 1959 issue of *Flying Saucers* and thereafter ran a voluminous correspondence on the subject.

According to Giannini, Bernard and Palmer, Rear-Admiral Byrd announced in February 1947, prior to a supposed flight of 1,700 miles (2,750 kilometres) beyond the North Pole: 'I'd like to see that *land beyond the Pole*. That area beyond the Pole is the centre of the *Great Unknown*.' Giannini, Bernard and Palmer also claimed that during Byrd's supposed flight over the North Pole in February 1947, he reported by radio that he saw below him, not ice and snow, but land areas consisting of mountains, forests, green vegetation, lakes and rivers; and, in the undergrowth, a strange animal that resembled a mammoth. Also, according to Giannini, Bernard and Palmer, in January 1956, after leading another expedition to the Antarctic, Byrd claimed that his expedition had there penetrated to a land extent of 2,300 miles (3,700 kilometres) *beyond* the South Pole. Last but not least, they claimed that just before his death in 1957, Byrd had called the land beyond the Pole 'that enchanted continent in the sky, land of everlasting mystery'. That land, according to other hollow Earth theorists, was actually the legendary Rainbow City, home of a fabulous lost civilization.

For Giannini, Bernard and Palmer, Rear-Admiral Byrd's reported comments merely confirmed what they had suspected all along: that the Earth is shaped 'strangely' at both Poles, something like a doughnut, with a depression that either goes down an enormous distance into the bowels of the Earth or forms a giant hole that runs right through the Earth's core, from one Pole to the other. Since geographically speaking it would be impossible to fly 1,700 miles (2,750 kilometres) beyond the North Pole or 2,300 miles (3,700 kilometres) beyond the South Pole without seeing water, it stands to reason that Rear-Admiral Byrd must have flown *down* into the enormous convex depressions at the Poles, into the 'Great Unknown' of the Earth's interior, and that, had he flown farther, he would have arrived eventually at the secret base of the UFOs belonging to the hidden super race - perhaps the legendary Rainbow City that Byrd had possibly seen reflected in the Antarctic sky.

Thus, when in June 1970 Ray Palmer was able to publish an official satellite photograph that showed what appeared to be an enormous black hole

at the North Pole, hollow Earth theorists all over the world were confirmed in their beliefs - and the controversy began.

But is the Earth really hollow? And do the holes in the Poles actually exist? The short answer is, 'No.'

The most extensive research has produced no confirmation for any of the extraordinary statements attributed to Rear-Admiral Byrd - nor for his reported flight over the North Pole in February 1947. (Byrd flew over the *South* Pole on 16 February 1947, during his extensive Operation Highjump.) Even accepting that Byrd *did* make such comments, it is more reasonable to assume that 'the land beyond the Pole' and the 'Great Unknown' were merely descriptive phrases for hitherto unexplored regions, rather than for unknown continents hidden in a hollow Earth - and that the 'enchanted continent in the sky' was no more than a description of a phenomenon common in Antarctic conditions: the mirage-like reflection of the land below.

But what, precisely, did Rear-Admiral Byrd say? In extracts from his journal, published in the *National Geographic* magazine of October 1947, he wrote: 'As I write this, we are circling the South Pole... The Pole is approximately 2,500 feet (760 metres) below us. On the other side of the Pole we are looking into that vast unknown area we have struggled so hard to reach.'

Did Byrd claim to have flown 1,700 (2,750 kilometres) beyond the North Pole in February 1947? No. Describing his flight beyond the *South* Pole on 16 February 1947, he wrote: 'We flew to approximately latitude 88° 30 south, an estimated 100 miles (160 kilometres). Then we made approximately a right-angle turn eastward until we reached the 45th east meridian, when we turned again, this time on the way back to Little America.'

Did Byrd report seeing on his journey, not ice and snow, but land areas consisting of mountains, forests, green vegetation, lakes and rivers; and, in the undergrowth, a strange animal that resembled a mammoth? No. According to his journal: 'Altogether we had surveyed nearly 10,000 square miles (25,900 square kilometres) of "the country beyond the Pole". As was to be expected, although it is somewhat disappointing to report, there was no observable feature of any significance beyond the Pole. There was only the rolling white desert from horizon to horizon.'

The fabled Rainbow City is almost certainly no more than a romanticized

rewrite of Rear-Admiral Byrd's original description of his flight back from the South Pole in February 1947, over hitherto unexplored country between the Beardmore and Wade Glaciers. 'It might have been called the Avenue of Frozen Rainbows,' Byrd wrote. 'To east and west towered great mountains. Some were free of ice - coal black and brick red. Others were completely ice-covered. These looked like titanic waterfalls. Where the sun struck their peaks and slopes the light was reflected from them in an indescribable complex of colours. There were blends of blue, purple, and green such as man seldom has seen.'

Thus, given Byrd's actual words as distinct from those attributed to him, we can see that neither lush green lands nor living mammoths were observed beyond the South Pole; that the quoted figure of 1,700 miles (2,750 kilometres) beyond the Pole, even if not invented, was probably extrapolated from an original figure given in square miles; that Rainbow City has no substance other than as Byrd's descriptive 'Avenue of Frozen Rainbows' - a normal atmospheric phenomenon in the Antarctic - and that 'the land beyond the Pole' and the 'Great Unknown' were actually, in Byrd's words, 'the vastest unknown which remains in the world'.

Nonetheless, could the Earth still be hollow? Again, the answer has to be negative. Contrary to the assertions of the hollow Earth theorists, the physical properties and structure of the Earth's interior can now be accurately measured with seismometers and electronic computers. Far from being hollow, the Earth is composed of three principal layers: the crust, the mantle and the core. The crust of granite and basalt rock is up to twenty-five miles (forty kilometres) thick (much thinner beneath the deep oceanic basins). Below the crust is the mantle, extending downwards for about 1,800 miles (2,900 kilometres), solid and composed of magnesium silicates, iron, calcium and aluminium. And below that is the core, believed to be predominantly composed of metallic iron in the molten state. Finally, at a depth of about 3,160 miles (5,090 kilometres), is the boundary of the inner core, which may be solid as the result of the freezing under the extraordinary pressure of about 3,200,000 atmospheres. Certainly, then, the Earth is not hollow.

So what about the enormous hole apparently shown on the ESSA-7 satellite photograph of the Arctic regions? The photograph is actually a mosaic of television images gathered by the onboard vidicon camera system of the satellite over 24 hours, showing the Earth from many angles. The

images were processed by a ground computer and reassembled to form a single composite view of the Earth as if observed from a single point directly over the Pole. During the 24 hours, every point in the middle and equatorial latitudes received sunlight for a period, and so appears on the composite picture. But regions near the Pole were experiencing the continuous darkness of the northern winter. Hence an unlit area occupies the centre of the picture.

Similar pictures made during the northern summer show the polar ice-cap. So do pictures made at any time of year using infrared (heat) wavelengths, since the Earth sends out heat radiation during both night and day.

In short, there are no holes at the Poles - and the Earth is not hollow.

Although the Antarctic is an inhospitable continent known as the White Desert and Home of the Blizzard, where snow and ice form 95 per cent of the surface terrain, it does have many ice free areas, such as the Taylor, Wright and Victoria valleys near McMurdo Sound. Other, lesser known ice free areas are hidden at the base of mountains or under the vast ice sheets that reach heights of 11,500 feet. Contrary to popular belief, Antarctica also has rivers, lakes, about 800 species of cold-tolerant land plants, mosses, linchens, liverworts, molds, yeasts, other fungi, and varied flora and fauna. As the *Encyclopaedia Britannica* tells us: ‘The continent was ice free during most of its lengthy geological history, and there is no reason to believe it will not become so again in the probably distant future.’

It is not yet known just what lies concealed in buried mountain ranges, such as the recently found Gamburtsev Mountains. The extraordinarily thick cover (average thickness of 6,500 feet), the extreme difficulty of the working conditions, and the great expense of mounting expeditions into remote areas have ‘long left geological knowledge of Antarctica far behind that of other continents’. In other words, while Antarctica is a place that can be inhabited by man, the greater portion of it remains relatively unexplored, therefore unknown.

While the Englishman Edward Bransfield, the American Nathaniel Palmer, and the Russian Fabian Gottlieb von Bellingshausen all claim first sightings of the continent in 1820, the first actual sighting is now believed to have been by the latter. Exploitation of the rich Antarctic and sub-Antarctic seas, particularly along Scotia Ridge, took place from the 1760s to about

1900, with the hunting of seal and whales by US, British, Argentine, Australian, New Zealand, German, and Norwegian vessels. Bellingshausen, commanding the Russian ships *Vostok* and *Mirny*, made the first circumnavigation of the continent in 1819-21; a British expedition led by Branson charted part of the Antarctic peninsula in 1819-20; the French expedition of 1837-40, commanded by Dumont d'Urville, led to the discovery of Adélie Land, which the French claimed; the US Naval expedition led by Charles Wilkes explored a large section of the East Antarctic coast in 1838-42; and during the British expedition of 1839-43, James Clark Ross discovered the Ross Sea and Ross Ice Barrier (now the Ross Ice Shelf), as well as the coast of Victoria Land.

The great era of land exploration began in the period 1901-13 when the Englishmen Robert F. Scott and Ernest Henry Shackleton led three expeditions into the interior, making important geological, glaciological, and meteorological discoveries that laid the foundations for the present-day scientific program. Even deeper probes into the continent were made by Scott and Shackleton in later years, both launched from base camps on Ross Island, with the latter reaching a point within ninety-seven miles of the South Pole on 9 January 1909. Scott eventually reached the Pole itself on `7 January 1912.

By this time Shackleton had presaged the mechanical age in Antarctica with the use of a motor car at Cape Royds, and Scott had presaged the aerial age by using a captive balloon for aerial reconnaissance. However, the true beginning of the mechanical, particularly the aerial, exploration of the continent began in the period between World Wars 1 and II, when motor transport, aircraft, aerial cameras and radios came into their own. The first Antarctic heavier-than-air flight was made on 16 November 1928 by Alaskan bush pilot C.B. Eielson and George Herbert Wilkins in a Lockheed Vega monoplane. Rear-Admiral Richard E. Byrd was first to fly over the South Pole, which he did on 29 November 1929. He followed this great achievement with his four famous air-supported expeditions, which took place between 1928 and 1947, leading to the increasing use of skiplanes and aerial photography.

The south geomagnetic pole, the theoretical pole of the Earth's magnetic field, was reached by a Soviet IGY (International Geophysical Year of 1957-58) tractor traverse on 16 December 1957; and the pole of relative

inaccessibility, the point most remote from all coasts, was reached, again by the Soviets, on 14 December 1958. After various set-backs, the dream of an overland crossing of the continent came true when, on 24 November 1957, using tracked vehicles and aided by aerial flights, the British Commonwealth Trans-Antarctic Expedition led by Vivian Fuchs left Shackleton Base on Filchner Ice Shelf and, by way of the South Pole, reached the New Zealand Scott Base on Ross Island on 2 March 1958.

By this time, territorial claims were being made by the various nations involved in exploration. Between 1908 and 1942, seven nations decreed sovereignty over certain sectors of the continent. While the US refused to recognize any claims of sovereignty as valid, Chile claimed Ellsworth Land, Australia claimed the American Highland near Amery Ice Shelf of East Antarctica, Nazi Germany claimed Queen Maud Land even though it was claimed by Norway, the French claimed Adélie Land, and though the British initially claimed Victoria Land, it was later claimed by New Zealand. In January 1943, in the middle of World War II, the British ignored Argentine's claim to Deception Island and established a base there. Britain, Argentina and Chile squabbled over various claims to the Antarctic Peninsula, with violence flaring up on occasion. By the early 1950s, with the US still refusing to recognize any claims of sovereignty as valid and the Soviet Union taking the same stand regarding claims made without its participation, a profusion of British, Argentine and Chilean bases was cluttering the Peninsula and nearby islands, while France, Norway, Sweden, South Africa, and Australia had raised their flags defiantly over other areas.

Notably absent from this collection was Germany, so recently defeated in war. This is ironic in that Nazi Germany had a particular interest in the Antarctic; and by the early 1950s, studies of the non-military aspects of Nazi philosophy were revealing just why this was so.

The Third Reich was born from a dangerous *völkish* mysticism: the Cosmic Circle of Munich; the Anthroposophy of Rudolph Steiner; the Theosophy and Rosicrucianism of Vienna and Prague; the Luminous Lodge and the Thule Group; the ancient dreams of Atlantis and Lemuria and the true 'Nordic' German. Central to this was the bizarre 'World Ice' theory of the unorthodox cosmologist, Hans Hörbiger, who preached that the universe had come into being because of, and was maintained by, an eternal struggle

between ice and fire. According to Hörbiger, the original ‘free’ matter in the universe was in the form of frozen ice. Chunks of the ice often fell into stars, and the debris from the resulting, immense explosion formed our planetary system. As this theory could be used to discredit the Theory of Relativity put forward by Dr Albert Einstein, an eminent Jew, it was taken up enthusiastically by many Nazis, including the party philosopher, Alfred Rosenberg, and the mystically inclined Heinrich Himmler and Rudolf Hess. The last two named also believed in Thule, which actually lies off the coast of Greenland, but which legend has it was a long vanished civilization, like Atlantis, consisting of a pure Aryan, or ‘Nordic’ peoples.

This vision of a ‘pure’ Aryan race, or ‘Master Race’, became inextricably entwined with the belief that the lost Thule was not the ‘Thule’ located in Greenland, but another place altogether, which had not been lost but merely moved elsewhere, either by the shifting of land masses or by one of the many ‘cosmic’ catastrophes described by Hörbiger. Last but not least, since part of Hörbiger's theory, as well as the so-called ‘secret doctrine’, has it that mankind lives on the inside surface of a hollow Earth, certain Nazis, including Himmler and Hess, began thinking of the resurrection of the Master Race in terms of isolated colonies, located in Nordic, or icy, areas where the ‘impurities’ of German youth could be breeded out and the ‘pure’ Aryan ‘Master Race’ be recreated through the process of selective breeding and monastic, military discipline.

To this end, the Nazi hierarchy created Himmler’s Death’s Head SS troops, practised the sterilization or extermination of ‘inferior’ races, researched racial characteristics through the *Ahnenerbe* (Institute for Research into Heredity), including the ghastly ‘anthropological’ experiments undertaken in the concentration camps, and established ‘breeding colonies’ in the shape of the ghastly *Lebensborn* organization which, under the guise of a national maternity home and hostel for nursing mothers, was actually a collection of stud farms for the elite of the SS. The Nazis also raced to invent highly advanced ‘secret weapons’ and find the great spaces (hopefully underground, or well hidden, like the many immense rocket sites) before the war ended with their defeat.

This much is known. Toward the end of 1938, Hitler, anxious for a foothold in the Antarctic, sent an expedition commanded by Captain Alfred Rischter

to the South Atlantic Ocean coastal region of Antarctica. The expedition arrived there in early 1939. Daily for three weeks two seaplanes were catapulted from the deck of the German aircraft carrier, *Schwabenland*, with orders to fly back and forth across the territory that previous Norwegian explorers had named Queen Maud Land. According to the *Encyclopaedia Britannica*: 'The German Antarctic Expedition of 1939 aerially photographed an extensive segment of Princess Astrid and Princess Martha coasts of western Queen Maud Land and, dropping metal swastikas over the region, claimed it for the Hitler government (the area is now claimed by Norway)'. The Germans called this territory Neu Schwabenland.

Throughout the war, German ships and U-boats continued to prowl the South Atlantic Ocean along the coastline of Antarctica, thus blocking any possible incursions into Neu Schwabenland. In 1941 a couple of large Norwegian whaling ships were seized by boarding parties from the German raider *Pinguin* as they rested at anchor in their own territorial waters just off Queen Maud Land. Within hours of that incident, a Norwegian supply ship and most of the nearby whaling convoy suffered the same fate. Not long after, in May 1941, HMS *Cornwall* located and sank the *Pinguin*, but not before the latter had captured a whole string of Allied merchant ships totalling more than 135,000 tons. What is also historical fact is that *Pinguin's* sister ships, appropriately named *Komet* and *Atlantis*, continued to prowl the Antarctic shores until the end of the war.

In London there was growing concern that a 'pro-German Argentine government' might take control of the vital Drake Passage. Thus, in 1944, the British established a permanent base on Deception Island.

On 25 April 1945 the German submarine *U-977*, commanded by Captain Heinz Schaeffer, put out of Kiel Harbour in the Baltic. That submarine stopped in at Christiansand South on 26 April, departed the following day, and was not seen again until it surfaced at Mar del Plata, Argentina, on 17 August - a period of nearly four months.

Where was the submarine all that time? According to Captain Schaeffer, he had left with the intention of patrolling the South Atlantic Ocean, had docked for fuel at Christiansand South the following day, and had then, several days later, heard over the radio the news that the war was over. Convinced that they would not be treated too kindly by the Allied Command, Schaeffer gave his crew the option of being put off along the coast of Norway

or instead traveling on with him to what he assumed would be a friendly Argentina. Since some of the crew preferred to return to Germany, the next few days were spent in hugging the Norwegian coastline, until, on 10 May, some of the men were dropped off on the mountain coast not far from Bergen. This done, according to Schaeffer, he and the remaining crew embarked upon what surely must have been one of the most remarkable naval feats of the war: a journey through the North Sea and English Channel, past Gibraltar and along the coast of Africa, to finally surface, all of sixty-six days later, in the middle of the South Atlantic Ocean. During the next month they alternated between floating on the surface and diving back to the depths, once even surfacing off the Cape Verde Islands and going ashore on Branca Island; another time going so far as to 'disguise' the submarine when it was on the surface by rigging up false sails and funnel to make it more like a cargo steamer.

Finally, when close to Rio de Janeiro, they heard over their radio that another fleeing German submarine, *U-530*, had put into the River Plate and that its crew had been handed over to the United States as prisoners of war. Disturbed by this news, Schaeffer nonetheless put into Mar del Plata on 17 August 1945 - nearly four months after he had put out from Kiel harbour.

Since this is an unusually, even remarkably, long time for a submarine such as the *U-977* to be at sea, Captain Schaeffer, when he docked at Mar del Plata, was interrogated by the Argentine authorities regarding why he had arrived in Argentina so long after the war had ended. He was also asked if *U-977* had carried anyone of 'political importance' during its voyage to Argentina. He explained his late arrival in Argentina with the fantastic story recounted above, and stated that no-one of political importance had ever been aboard *U-977*.

Even more intriguing is that a few weeks later, an Anglo-American commission, composed of high-ranking officers flown especially to Argentina to investigate the 'mysterious case' of *U-977*, spent a great deal of time interrogating Schaeffer regarding the possibility that he might have taken Hitler and Martin Bormann aboard his U-boat, first to Patagonia, then on to a secret Nazi base in the Antarctic. Indeed, they were so insistent on this that they subsequently flew Schaeffer and his crew - *and* Otto Wehrmut, commander of *U-530* - back to a prisoner-of-war camp near Washington DC, where for months they continued their interrogations. The fate of Wehrmut

remains unknown, but according to Schaeffer, he repeatedly denied having shipped anyone anywhere. Nonetheless, he was then handed over to the British in Antwerp, Belgium, and *again* interrogated for many months. Oddly, since Schaeffer stuck to his story and reportedly the Allies found nothing unusual in *U-977*, the submarine was taken to the United States where, under direct orders from the US War Department, it was blown to pieces.

As for Schaeffer, whether telling the truth or not, he was shipped back to Germany, did not feel comfortable under Allied rule, and so went back to join other expatriate German officers in Argentina - which was, and remains, the last major stop before the South Atlantic coastline of Antarctica.

This much is known, also. The International Geophysical Year (IGY) of 1957-58 was created to allow the nations of the world to 'take advantage of increasing technological developments, interest in polar regions, and, not the least, the maximum sunspot activity expected in 1957-58. It was adopted by the International Council of Scientific Unions (ICSU) and coordinated by the Comité Spécial de l'Année Géophysique Internationale (CSAGI) and eventually, with 67 nations joining, plans were laid for simultaneous observations of the sun, the aurora, the magnetic field, the ionosphere, and cosmic rays. Twelve nations taking part established more than fifty overtime winter stations on the continent. Massive tractor runs and airlifts enabled inland stations to be established: Byrd Station in West Antarctica for the US; Amundsen-Scott Station at the South Pole, also for the US; and Vostok Station at the geomagnetic pole for the USSR and at the pole of inaccessibility, also for the USSR. Many coastal bases were also established.

This was the greatest scientific program ever launched in the history of Mankind - and its main concentration was on two areas: outer space and Antarctica. For eighteen months, from 1 July 1957 to 31 December 1958, there was a frenzy of scientific activity, resulting in a vast collection of data on cosmic rays, the aurora and airglow, geomagnetism, gravity measurement, ionospheric physics, meteorology, oceanography, and seismology. Even more startling, in recollection, is that this wealth of information was gathered by satellites launched by the United States and the Soviet Union. It was then, through World Data Centres established to collect all observations, made freely available for analysis to scientists of *any* nation.

Even as this unprecedented act of international cooperation was taking place, notably in Antarctica, worldwide UFO sightings were reaching their peak and, simultaneously, a blanket of disinformation and secrecy was falling over what was now being termed officially: ‘the UFO problem’.

Chapter 12

Disinformation and the International Cover-Up

US Air Force involvement in official UFO investigations began as far back as 1947 at the Intelligence Division of the Air Force's Air Material Command, based at Wright Field (now Wright-Patterson AFB) in Dayton, Ohio. Contrary to its public debunking of civilian UFO sightings, the Air Force was actually in a state of near panic because of a wave of sightings, first over Maxwell Air Force Base in Montgomery Alabama, then, to the horror of the top brass, over the White Sands Proving Ground - right in the middle of their Atom bomb territory. Finally, after a whole series of sightings on 8 July 1947, over Muroc Air Base (now Edwards AFB) - their top-secret Air Force test centre in the Mojave Desert, California - they decided to do something about it.

General Nathan Twining, commander of the Air Materiel Command, wrote to the commanding general of the Army-Air Force stating that the phenomenon was something real, that it was not 'visionary or fictitious', and that the objects were disk-shaped, as large as aircraft, and *controlled*. Shortly after, on 22 January 1948, a UFO investigation program, Project Sign, was established, given a 2A classification, and placed under the jurisdiction of the Intelligence Division of the Air Force's Air Material Command at Wright Field. Later renamed the Air Technical Intelligence Centre, or ATIC, its function was to 'collect, collate, evaluate and distribute to interested government agencies and contractors all information concerning sightings and phenomena in the atmosphere which can be construed to be of concern to the national security'.

The UFO-related death of Air Force pilot Captain Thomas F. Mantell over Godman AFB, Kentucky, on 7 January 1948, combined with the 'classic' UFO sighting made by Eastern Airlines Captain Charles S. Chiles and co-pilot John B. Whitted near Montgomery, Alabama, on the evening of 24 July the same year, prompted Project Sign to write an official, top-secret Estimate of the Situation. That Estimate outlined the whole history of UFO sightings, including the fireballs, Scandinavian 'ghost rockets' and American

sightings before 1947, then concluded that the UFOs were of extraterrestrial origin. Classified as top secret and issued in July 1948, the Estimate was sent through channels, all the way to Chief of Staff, General Hoyt S. Vandenberg; but to the surprise of all concerned, the general rejected it on the grounds that it 'lacked proof'.

Possibly it was fear of further offending the powerful general that led to a whole new policy at Project Sign: in the future, Sign personnel were to assume that *all* UFO reports were hoaxes. Not only that, but they had to check with FBI officers, and with the criminal and subversive files of police departments, looking into the private lives of the witnesses to see if they were 'reliable'. Most of the Project Sign team took this as fair warning that it was not particularly wise to raise the subject of UFO sightings - and as if to prove them right, the Sign Estimate was later incinerated, reportedly on the orders of General Vandenberg.

On 11 February 1949, Project Sign was renamed Project Grudge. While the Air Force claimed that this was because the classified name 'Sign' had been compromised, there were those who took it as another indication of General Vandenberg's displeasure with their findings. Certainly, the new, lowlier status of Project Grudge was indicated in the recommendation made in Project Sign's final report: 'Future activity on this project should be carried on at the *minimum* level (author's emphasis) necessary to record, summarize and evaluate the data received on future reports and to complete the specialized investigations now in progress.'

It now became the function of Project Grudge to shift the investigations away from the actual UFOs and on to those who reported them - but since a good twenty-three per cent of their reports were still classified as unknowns, this wasn't that easy. Nevertheless, Project Grudge launched a public relations campaign designed to convince the American public that UFOs did not represent 'anything unusual or extraordinary'. As part of their 'debunking' effort, they encouraged the *Saturday Evening Post* journalist Sidney Shallet to write a two-part article exposing UFOs as a waste of time; but when that backfired by increasing public interest rather than diminishing it, the Air Force tried to counteract by stating officially that UFOs were either misidentifications of natural phenomenon or the products of mass hallucination.

Project Grudge issued its final report in August 1949 - only six months

after its inception. Put simply, its conclusion was that while 23 per cent of the UFO reports were still classified as unknowns, most had ‘psychological explanations’ and the investigation was therefore a waste of time and should be downgraded even further. On 27 December the Air Force announced the termination of the project. Shortly after, the Project Grudge records were stored and most of its personnel were widely scattered.

The most famous, and certainly the most respected, head of the Air Force’s UFO research project was Captain Edward J. Ruppelt, who was assigned to the Air Technical Intelligence Centre in January 1951, working as project director under General Lieutenant Jerry Cummings. Prior to moving to ATIC, Ruppelt had no particular interest in UFOs, but what he found in the ATIC files intrigued him.

He was particularly impressed by the reports on the two movies taken in 1950 by Air Force technicians at the White Sands Proving Ground (not to be confused with the cinetheodolite photos taken earlier by Navy Commander R.B. McLaughlin), which was fully instrumented to track high-altitude, fast-moving objects - usually the guided missiles - and had camera stations equipped with cinetheodolite cameras located all over the area. In June of that year two UFOs had been shot by two different cameras. By putting a correction factor in the data gathered by the two cameras, the Photo Laboratory at White Sands was able to arrive at a ‘rough’ estimation of the objects’ size, altitude and speed. According to their report, the UFOs were over 300 feet in diameter, higher than 40,000 feet, and traveling at over 2,000 mph.

On 25 August 1951 the famous UFO sightings at Lubbock, Texas, caused an enormous stir with the American public. When those sightings were followed by the Fort Monmouth sightings of 12 September 1951 - which were clearly seen by a lot of visiting top brass - the Air Force was galvanized back into action and, in March 1952, Project Grudge was upgraded from ‘a project within a group’ to a separate organization. Renamed Project Blue Book, it was based at ATIC in Wright-Patterson AFB, Dayton, Ohio, with Captain Ruppelt as its chief.

Ruppelt took the UFO sightings seriously, but after the debacle of the Washington UFO ‘invasion’ of July, 1952, when he was hampered from doing his job and so many witnesses contradicted their original statements, he

became convinced that pilots reporting UFOs were being intimidated into changing their reports or simply remaining silent, that a lot of information was being withheld from Blue Book, and that the CIA were stepping into the picture for unexplained reasons.

The person who most worried Ruppelt was Chief of Staff, General Hoyt S. Vandenberg. It was Vandenberg who had buried the original Project Sign Estimate, caused its incineration, and had the project renamed Project Grudge. It is not clear just *how much* Vandenberg was influencing either the Air Force or the CIA, but he had been head of the Central Intelligence Group (later the CIA) from June 1946 to May 1947 and his uncle had been chairman of the Foreign Relations Committee, then the most powerful committee in the Senate. Clearly, Vandenberg still had great influence in those areas - and according to Ruppelt, pressure was always coming from them to suppress the results of official UFO investigations.

Ruppelt was therefore not surprised when he was informed that the CIA and some high-ranking officers, including Generals Vandenberg and Samford, were, against the objections of the Batelle Memorial Institute (a private research group used by the Air Force to carry out statistical studies of UFO characteristics), convening a panel of scientists to analyze all the Blue Book data. Nor was he surprised to discover that this panel was to be headed by Dr H.P. Robertson, director of the Weapons System Evaluation Group in the Office of the Secretary of Defence - and a CIA classified employee.

The Robertson Panel was convened in great secrecy in Washington DC during January 1953. While some insist that it opened on 12 January, the dates on the group's final report state 14- 18 January. Apart from Robertson, the group's panel consisted of physicist and Nobel Prize-winner Luis W. Alvarez; geophysicist and radar specialist Lloyd V. Berkner, and physicist Samuel Goudsmit, both of the Brookhaven National Laboratories; and astronomer and astrophysicist Thornton Page, Deputy Director of the John Hopkins Operations Research Office. Other participants included J. Allen Hynek, then a consultant to the United States Air Force; Frederick C. Durant, an army ordnance test station director; William M. Garland, the Commanding General of the Air Technical Intelligence Centre (ATIC); ATIC's Pentagon liaison officer, Major Dewey Fournet; Project Blue Book chief, Captain Ruppelt; two officers from the Navy Photo Interpretation Laboratory; and

three high-ranking CIA representatives.

The seriousness with which the subject was supposed to be treated is best illustrated not only by the calibre of the men involved, but also by the fact that the group's report was to be given to the National Security Council (NSC) and then, if the decision was that the UFOs were of extraterrestrial origin, to the President himself. This may have been so much cotton wool.

For the first two days of the session, Captain Ruppelt reviewed the Blue Book findings for the scientists. First, he pointed out that Blue Book received reports of only 10 per cent of the UFO sightings made in the United States, which meant that in five and a half years about 44,000 sightings had been made. He then broke the sightings down into the percentage that was composed of balloons, aircraft, astronomical bodies, and other misinterpretations, such as birds, blowing paper, noctilucent and lenticular clouds, temperature inversions, reflections, and so forth, and pointed out that this still left 429 as definite 'unknowns'. Of those unknowns, it was clear that the most reported shape was elliptical, the most often reported colour was white or metallic, the same number of UFOs were reported as being seen in daylight as at night, and the direction of travel equally covered the sixteen cardinal points of the compass. 70 per cent of those unknowns had been seen visually from the air - in other words, by experienced pilots and navigators; 12 per cent had been seen visually from the ground; 10 per cent had been picked up by airborne and ground radar; and 8 per cent were combination visual-radar sightings. Ruppelt also confirmed that many UFO reports came from top-secret military establishments, such as atomic energy and missile-testing installations, plus harbours and manufacturing areas.

Ruppelt and Major Dewey Fournet had completed an analysis of the motions of the reported unknowns as a means of determining if they were intelligently controlled. Regarding this, Major Fournet told the panel of how, by eliminating every possibility of balloons, aeroplanes, astronomical bodies, and so forth, from the hundreds of reports studied, and by then analyzing the motions of the UFOs in the remaining unknown category, his study group had been forced to conclude that the UFOs were, in the words of the group report: 'intelligently controlled by persons with brains equal to, or far surpassing, ours'. The next step in the study, Fournet explained, had been to find out where those beings came from; and since it seemed unlikely that their machines could have been built in secret, the answer was that the beings

were from outer space.

The morning after Fournet's summary, the panel was shown four strips of movie film that had been assessed as falling into the 'definite unknown' category. These were the cinetheodolite movies taken by Air Force technicians at the White Sands Proving Ground on 27 April 1950 and approximately a month later; the 'Montana' movie taken on 15 August 1950 by the manager of the Great Falls baseball team; and the 'Tremonton' movie taken on 2 July 1952 by Navy Chief Photographer, Warrant Officer Delbert C. Newhouse.

One of the White Sands movies showed 'a dark smudgy object' which proved only, in the words of Ruppelt, 'that something had been in the air and, whatever it was, it had been *moving'*. The second movie had been analyzed by the Data Reduction Group at Wright-Patterson AFB, with results indicating that the object had been approximately higher than 40,000 feet, traveling over 2,000 mph, and was over 300 feet in diameter. The Montana movie showed two large, bright lights flying across the blue sky in an echelon formation; the lights did not show any detail, but they appeared to be large, circular objects. The Tremonton movie showed about a dozen shiny, disk-like objects fading in and out constantly, performing extraordinary aerial manoeuvres, and darting in and out and circling one another in a cloudless blue sky. Any possibility that the objects might have been astronomical phenomena was dispelled when the film clearly showed them heading in the same tight cluster toward the western horizon and, more specifically, when one of them left the main group and shot off to the east.

The Montana movie had been subjected to thousands of hours of analysis in the Air Force laboratory at Wright Field and the results proved conclusively that the objects were not birds, balloons, aircraft, meteors, clouds, or reflections - in short, they were unknowns. As for the Tremonton movie, it had been studied for two solid months by the Navy Laboratory in Anacostia, Maryland, and their conclusion was that the unidentifieds were not birds or aeroplanes, were probably traveling at several thousands of miles an hour, and were, judging by their extraordinary manoeuvres, intelligently controlled vehicles.

In the view of Ruppelt and Fournet, the evidence seemed conclusive - yet the Robertson Panel still managed to reject it. After going over the evidence for two days, the panel concluded in its report that the evidence was *not*

substantial, that the continued emphasis on the reporting of the phenomenon was resulting in ‘a threat to the orderly functioning of the protective organs of the body politic’, and that the reports clogged military channels, could possibly precipitate mass hysteria, and might encourage defence personnel to misidentify or ignore actual enemy aircraft. In other words: the real problem was not the UFOs - it was the UFO *reports*.

Based on this assessment, the Robertson Panel made some unexpected, even startling, recommendations. First, it recommended that the two major private UFO organizations - the Aerial Phenomena Research Organization (APRO) and the Civilian Saucer Intelligence (CSI) - be watched because of what was described as their ‘potentially great influence on mass thinking’ in the event of widespread sightings. Included in this recommendation was the statement: ‘The apparent irresponsibility and the possible use of such groups for subversive purposes should be kept in mind.’ Next, it recommended that the national security agencies take immediate steps to strip the UFO phenomenon of its importance and eliminate the ‘aura of mystery’ it had acquired, the means being a ‘public education program’. Finally, the panel outlined a program of ‘public education’ with two purposes: training and debunking. The former would help people identify known objects and thus reduce the mass of reports caused by misidentification; the latter would reduce public interest in UFOs and thereby decrease or eliminate UFO reports.

As a means of pursuing this ‘education’ program, the panel suggested that the government hire psychologists familiar with mass psychology, military training film companies, Walt Disney Productions, and popular personalities such as Arthur Godfrey to subtly convey this new thinking to the masses. Also, contrary to what the CIA were later to tell Ruppelt, it was decided *not* to declassify the sighting reports and, instead, to tighten security even more and continue to deny ‘non-military personnel’ access to UFO files.

It was clear then, certainly to Captain Ruppelt and other members of Project Blue Book, that the whole purpose of the Robertson Panel was to enable the Air Force to state for the next decade or so that an *impartial* body had examined the UFO data and found no evidence for anything unusual in the skies. While this was an obvious distortion of fact, it *did* mean that the Air Force could now avoid discussing the nature of the objects and instead concentrate on the public relations campaign to eliminate the UFO reports

totally.

Given the nature of the Robertson Panel's recommendations, there can be little doubt that they were directly responsible for the policy of ridicule and denial that has inhibited an effective study of the phenomenon ever since.

In December 1952, when it became obvious that the CIA and Air Force intelligence were between them trying to severely limit the investigations of Project Blue Book, Captain Ruppelt asked for a transfer. By the following February, when he was due to leave, no replacement for him had arrived; nor were there any replacements when Lieutenant Flues was transferred to the Alaskan Air Command, when Lieutenant Rothstein's tour of active duty ended, or when others on the staff left or were transferred out. Thus, when Ruppelt was transferred out in February, he left a drastically reduced Blue Book staff. By the time he returned, in July, he found that the Air Force had reassigned most of the remaining staff, that they had sent no replacements for them, and that his Blue Book now consisted of only himself and a mere two assistants. Project Blue Book had virtually been closed down.

In August 1953 Ruppelt left the Air Force... and the Pentagon issued the notorious Air Force Regulation 200-2. This was drafted purely as a public relations weapon in that it prohibited the release of *any* information about a sighting to the public or media, except when it was *positively* identified as natural phenomena. In addition, whereas AFR 200-5, the previous classification, had stated that sightings should not be classified higher than restricted, the new regulation ensured that *all* sightings would be classified as restricted. Then, much worse, in December 1953 the Joint Chiefs of Staff followed AFR 200-2 with Joint-Army-Navy-Air Force Publication 146. This made the releasing of *any* information to the public a crime under the Espionage Act, punishable by a one to ten year prison term or a fine of $10,000. And the most ominous aspect of JANAP 146 was that it applied to anyone who knew it existed, including commercial airline pilots.

Needless to say, this new regulation effectively put a stop to the flow of information to the public.

By the end of that year, the investigating authority of the decimated Project Blue Book had been handed over to the inexperienced 402d Air Intelligence Squadron and most of its operations had been cut off by a drastic reduction in funding. Ruppelt, Fournet and the other original members of the

team were no longer involved; and General Garland, once a strong Ruppelt supporter, never again raised his voice in defence of any UFO investigation.

To all intents and purposes, and contrary to official Air Force pronouncements, the UFO project had been plunged into secrecy.

Why?

By 1953 the US was fighting the war in Korea, the Soviets had dropped their first hydrogen bomb, and the cold war was in its chilliest phase. This was good enough reason for the Robert Panel to claim that the UFO reports were a threat to national security: first, because a deliberately confused American public might think attacking enemy bombers were merely UFOs; second, because a foreign power could exploit the UFO craze to make the public doubt official Air Force statements about UFOs and thereby undermine public confidence in the military; and third, because in terms of psychological warfare, the communications lines of the whole country could be saturated by a few hundred phone calls; and such calls (which always came after a rash of UFO sightings) were putting the defence network in jeopardy.

Those were the reasons given for the recommended program of ‘public education’, or, in layman's terms, the suppression of information.

If it is true that national security was the issue, then the suppression of information had a certain amount of logic behind it. However, if national security was the *only* concern, why was the Air Force humiliating so many UFO witnesses, harassing its own ground and air crews into remaining silent, and even threatening civilian airline pilots with enormous fines or jail sentences? The only explanation is that the higher echelons of the Air Force were more concerned about the phenomenon that they were willing to admit, that they possibly knew more about it than they were willing to say, and that for reasons of their own, they were actively discouraging their most competent personnel, such as Captain Ruppelt, from investigating or reporting on the subject.

In September 1952, approximately four months before the convening of the Robertson Panel, Ruppelt had investigated the UFO sightings over the NATO fleet during Operation Mainbrace and assessed all the sightings as unknowns. This encouraged him to imagine that he could now pin down the UFOs for good - and it was this very enthusiasm that led to the destruction of

the most important system ever devised for UFO research.

For a long time Ruppelt and Brigadier General Garland, then chief at ATIC, had been looking for a way of getting concrete information about the UFOs. What they eventually came up with was a plan for visual spotting stations to be established all over northern Mexico - the area that had consistently produced more UFO reports than any other place in America. The visual spotting stations would be equipped with specially designed sighting devices, all of which would be linked with an instantaneous interphone system; any two stations could then track the same object and, from their separate readings, compute the UFO's altitude, speed and characteristics. Also at each visual spotting station would be instruments to measure the passage of any body that was giving off heat, any disturbance in Earth's magnetic field, and any increase in nuclear radiation at the time of the sighting.

This was the first time that a proper, scientific system had been designed and submitted to the Air Force. According to Ruppelt, it was virtually foolproof and had it been adopted, it would have been possible to track, photograph and measure UFOs with unprecedented precision - yet nothing came of it.

There is no proof that the Air Force deliberately killed it off, but these are the facts as reported by Ruppelt...

In December 1952, when Ruppelt's plans went to Washington DC for approval, the US Navy were preparing to shoot their first H-bomb during Project Ivy and some officers in the Pentagon, recalling the unidentifieds seen over Operation Mainbrace, directed Ruppelt to fly out to the test area and organize a UFO reporting team. That order actually came down in November, but Ruppelt's plans for the visual-radar sighting network were received in Washington DC the following month... and a few days later, for reasons never explained, Ruppelt's trip to Project Ivy was cancelled. A month later, in January 1953, came the Robertson Panel and its consequences. By August of that year, Ruppelt had left the Air Force - and the activities of Project Blue Book were wound down.

After leaving the Air Force, Ruppelt went to work for the Northrop Aircraft Company and, in his spare time, wrote *The Report on Unidentified Flying Objects* (1956), in which he stated his belief that UFOs were a genuine phenomenon and probably of extraterrestrial origin. Three years

later, however, he inexplicably revised the book, adding three chapters in which he completely reversed his previous opinions. Many believe that this was due to pressure from official quarters; others are equally convinced that it was his response to the wilder claims of UFO contactees.

Since Ruppelt died unexpectedly of a heart attack in 1960, shortly after revising his book, the truth will probably never be known.

Throughout the UFO controversy, the scientists had remained silent, but in 1965, after a fresh, spectacular wave of sightings over Texas had caused nationwide concern and a revival of press interest, the US Air Force in particular came under fire for supposedly not telling the truth about UFOs. Knowing of the Air Force's concern, Dr J. Allen Hynek suggested that they set up a 'panel of civilian scientists' to review the situation once and for all, and the Air Force, agreeing, turned the program over to the Public Information Office. This led to the formation of the Ad Hoc Committee to Review Project Blue Book. It was headed by Dr Brian O'Brien, and the rest of the team, excepting Dr Carl Sagan, were members of the Air Force's scientific advisory board. The committee met for one day in February 1966, reviewed the Robertson report, and decided that while the UFOs did not threaten the national security, they *did* warrant further investigation. Their main recommendation was that the Air Force negotiate contracts with a few selected universities to provide teams of specialists who could investigate 'promptly and in depth' selected sightings of UFOs.

On 20 March 1966, eighty-seven women and a civil defence director at Hillsdale College, Michigan, saw a 'football-shaped, glowing object hovering over a swampy area a few hundred yards from the woman's dormitory'. The object flew repeatedly at, and retreated from, the dormitory, dodged an airport beacon light, dimmed and brightened, and was observed by the witnesses for four hours. The next day, five people, including two police officers, in Dexter, Michigan, saw a similar object rising from a swampy area on a farm. It hovered for a few minutes at about 1,000 feet, then left the area. Over a hundred other reports of similar sightings were received in those two nights in those two cities sixty-three miles apart.

The sightings led to an extraordinary press conference, held in the Detroit Press Club. Representing the Air Force, Dr J. Allen Hynek suggested to the clamouring journalists that the UFOs, or lights, could have been the

result of decaying vegetation that spontaneously ignited, creating a faint glow - in other words, swamp gas. His tentative suggestion was blown out of all proportion by the press, leading to accusations that the Air Force was engaged in a cover-up. There were also demands in the media for a proper, scientific investigation to be mounted. So great was the uproar that House Republican minority leader (later US President) Gerald R. Ford and Weston E. Vivian, Democratic congressman for Michigan, formally called for congressional hearings. Thus, on 5 April 1966, for the first time in the history of the UFO controversy, Congress held an open hearing on the subject. This led to the O'Brien committee recommendations being implemented - which in turn led to what many would consider to be the biggest Air Force cover-up of them all: the Condon committee report.

A Gallup Poll undertaken in May 1966 indicated that 96 per cent of the American people had heard or read about UFOs and that approximately *nine million* of them were convinced that they had actually seen one. That same month, a besieged Air Force disclosed publicly that it was going to contract with scientists for a UFO investigation. Five months later, on 7 October 1966, the Air Force announced that the University of Colorado had accepted the UFO project and that Dr Edward U. Condon, internationally known physicist and former head of the National Bureau of Standards, would be in charge. Working with Condon on the project would be Robert Low (Assistant Dean of the Graduate School) as project coordinator, and psychologists Stuart Cook and Franklin Roach as principal investigators.

In October 1966 the Condon committee got off to a bad start and went inexorably downhill thereafter. Within days of its formation, Condon was making it publicly clear that he did not believe in extraterrestrials or flying saucers, but *did* believe that the Air Force had been doing a good job of investigating the phenomenon. He also stated that there was 'an appalling lack of understanding' of 'ordinary phenomena' that could resemble UFOs, and that he hoped to 'reduce the number of UFO reports' through 'approved teaching about these things'. By 25 January 1967 Condon was informing the Corning Section of the American Chemical Society that his personal inclination was to 'recommend that the government get out of this business' and that in general he thought there was 'nothing to it'.

By this time it had become clear to dismayed observers that Condon had already decided to concentrate on only two facets of the phenomenon:

‘misinterpretations of natural phenomena, and the psychological bases for UFO reports’. At roughly the same time, John Lear, science editor of the *Saturday Review*, publicly disclosed that the CIA had severely edited, or censored, the unclassified Robertson report, leaving out the names of the participants and many of their recommendations. Public concern over the actual contents of the report was only increased when Dr James E. McDonald, senior physicist at the University of Arizona’s Department of Atmospheric Sciences, revealed that he had read the classified Robert report and could confirm that the CIA had ordered the Air Force to debunk UFOs and those who reported them.

In view of Condon’s widely reported negativity about the phenomenon, McDonald’s revelations only increased cynicism about the motives and findings of the Condon committee. The committee staff included psychologists, a chemist, and an astronomer, and was backed up with project members of the calibre of Dr J. Allen Hynek, computer scientist Jacques Vallee, USAF Major Hector Quintanilla, the head of Project Blue Book, and Donald E. Keyhoe, director of the National Investigations Committee on Aerial Phenomena (NICAP), and his assistant director, Richard Hall. Nonetheless, it soon degenerated into a disturbing series of internal disagreements and personality clashes, most of them caused by the increasingly blatant cynicism of Condon and his project coordinator, Robert Low, both of whom showed a distinct partiality to absurd contactee-like claims and tried to block the inclusion of more reliable reports from military observers and civilian pilots.

These conflicts burst into the open when, in February 1968, Dr James E. McDonald revealed the contents of a memorandum submitted by Low in August 1966 to the administrators of the University of Colorado, in order to explain his views on the UFO phenomenon and the attitude which he felt the Condon committee should adopt. Low’s views, as expressed in the memorandum, were that the UFO phenomenon had ‘no physical reality’, that the staff of the Condon committee should be composed of ‘nonbelievers’, and that the best way to bolster a healthily negative attitude about UFOs would be to focus on the psychology and backgrounds of those who report them.

‘The trick,’ Low wrote, ‘would be to describe the project so that, to the public, it would appear a totally objective study but, to the scientific community, would present the image of a group of nonbelievers trying their

best to be objective but having an almost zero expectation of finding a saucer.'

The revealed contents of the Low memorandum nearly blew the Condon committee apart. An outraged Condon fired committee members David Saunders and Norman Levine, who had been instrumental in getting the report to Keyhoe and McDonald. The dismissal of these key members led to the resignation of Condon's administrative assistant, Mary Lou Armstrong. With Armstrong gone, others lost faith in Condon and left also, until eventually, out of the original staff, only Low and two other full-time staff members remained. NICAP then withdrew its support from the committee.

Saunders and Levine attacked Condon for his 'unscientific approach' to the subject. The same criticisms were levelled against Condon in Congress, which led to another Congressional hearing. This took place on 29 July 1968, under the auspices of the House Science and Astronautics Committee. Participants included Drs McDonald and Hynek, famed astronomer and writer Carl Sagan, sociologist Robert L. Hall, professor of civil engineering, James A. Harder, and astronautics engineer Robert M. Baker. These participants were prohibited from criticizing the Condon committee openly; nonetheless, the criticism was implied when they all recommended that the scientific investigation of UFOs be continued.

The Condon report was published in January 1969 with the seal of approval of the National Academy of Science (NAS). Its conclusion was that nothing of scientific value could come from the study of UFOs, that further study of the subject could therefore not be justified, and that Project Blue Book should be closed down. In order to reach this conclusion, Condon devoted most space to the 'identified' reports, carefully buried those considered to be genuine 'unidentifieds', wilfully ignored many of the conclusions reached by other contributors, and emphasized in his summary (which he placed at the beginning of the report instead of the end) the negative views he had been proclaiming publicly throughout the eighteen months of the Condon committee investigations.

In *The UFO Controversy in America*, David Michael Jacobs describes the Condon report as 'a rather unorganised compilation of independent articles on disparate subjects, a minority of which dealt with UFOs'. Others were not so generous. On 11 January 1969, a few days after the report appeared, McDonald, Keyhoe and Saunders held a press conference to

denounce it as a waste of money, pointing out that Condon had revealed his bias and the committee had failed to investigate the vast majority of 'significant' UFO reports. Later, on behalf of NICAP, Donald E. Keyhoe accused Condon of trying to discredit some witnesses, as well as concentrating on 'kook cases'. The Aerial Phenomena Research Organization (APRO) charged that Condon had not investigated enough cases, but added that his selected cases had been investigated inadequately, that the report was filled with inconsistencies and unsubstantiated conclusions, and that it should be 'dismissed and/or discredited'. James E. McDonald, J. Allen Hynek, and many others also offered extensive, valid criticism, much of which implied that Condon had been used by the Air Force to discredit the UFO phenomenon and give it an excuse to close down the UFO project once and for all.

This is did. On 17 December 1969, Secretary of the Air Force, Robert C. Seamans, announced the official termination of the Air Force's twenty-two year study of UFOs. The files of Project Blue Book were then placed in storage in Maxwell Air Force Base, Montgomery, Alabama.

As the Air Force had anticipated, the official closing of Project Blue Book dramatically reduced public interest in the UFO phenomenon. As a result of this, Dr J. Allen Hynek was no longer required and returned to teaching at Northwestern University. Membership of the National Investigations Committee on Aerial Phenomena (NICAP) was soon reduced from 12,000 to 4,000. The Aerial Phenomena Research Organization (APRO) had the same problem and Donald Keyhoe, after twelve years as director, was eventually forced to step down. By 1970, the 'UFO problem' was practically a forgotten issue in the press, though the ridicule attached to the study of the subject had greatly increased.

In 1971, Dr James E. McDonald, a loudly vocal opponent to the Condon report, had that ridicule used against him to discredit his professional credibility. As the scientist who had discovered that supersonic transport (SST) aircraft would reduce the ozone layer and lead to thousands of more cases of skin cancer in the United States, he was called to testify before the House Committee on Appropriations. Throughout his testimony he was relentlessly mocked about his belief in 'flying saucers' and 'little men flying around the sky', while his perfectly accurate warnings about ozone depletion were ignored. With similar humiliations heaped upon him in the following

months, both in and out of Congress, McDonald began suffering from depression, his marriage broke up, and in June of that year, at fifty-one years old, he committed suicide.

By the end of 1972, public interest in UFOs had been nullified, humiliation had ensured that new reports were relatively few, and the US Air Force, formerly compelled to give answers, could retain a comfortable silence. That official silence has been maintained to this day.

Howard Blum is an award-winning former *New York Times* journalist whose work has twice been nominated by the editors of that paper for the Pulitzer Prize in Investigative Journalism. The publication of his book *Wanted! The Search for Nazis in America* initially led to ridicule being heaped upon him from various official quarters, but finally resulted in Congressional hearings, the creation of a Justice Department War Crimes Task-force, and the deportation of thirty-seven people accused of war crimes.

Blum had no interest in UFOs whatsoever until, in 1987, when investigating the notorious John Walker spy family, he received a call from a senior official at the National Security Agency (NSA), asking for a clandestine meeting. During the subsequent meeting that official told Blum that ‘a lot of strange things’ were happening in space and, as a result, the government had formed a top-secret panel of ‘hot-shots’ to look into the UFO phenomenon.

That single meeting led Blum into a two-year investigation of what turned out to be a massive cover-up by the government regarding the UFO problem. By the end of his search, during which he talked to top officials in secret military bases, laboratories, aeronautical establishments, the Pentagon, the White House and even CIA Headquarters, Langley, Virginia, Blum had discovered that in the winter of 1987 the government, disturbed by ‘unexplained intrusions into our planetary space’, had summoned seventeen members of the US intelligence community to the Pentagon. Formed into a top-secret UFO Working Group, those seventeen men, including members of the NSA and the CIA, had since been meeting once a month in ‘the Tank’ - the innermost sanctum of the Pentagon - to assess reports of UFOs that were being constantly monitored by the US Space Command’s Space Surveillance Centre. Blum also discovered that the Pentagon, while insisting that it had no interest in UFOs, was involved in a ‘dirty tricks’ campaign to ensure that

anyone delving too deeply into the UFO mystery ended up a laughing stock and that infiltration of UFO groups and the spreading of misinformation were being used to protect the Pentagon's own UFO investigations from public scrutiny.

Impressed by the contents of the MJ-12 documents first discovered by the widely respected British UFO research and author, Timothy Good (classified reports of the recovery in 1948 of the crashed flying saucer at Roswell, New Mexico, and the dead bodies of its supposedly extraterrestrial four-man crew) and by what he had been told by various interviewees, Blum naturally accepted that the secret working group was concerned with extraterrestrial intervention. However, when Blum published his findings in a book, *Out There: The Government's Secret Quest for Extraterrestrials* (1990), he received the expected flak from the government. The US Space Command dismissed Blum's claim that the UFO Working Group had been formed after a UFO penetrated America's defence perimeter in December 1986 and insisted that the 'tripping' of the electronic fence in space had been caused by 'an explosion of a rocket body broken up into 400 pieces'. The Pentagon categorically denied that the UFO Working Group existed and insisted that there was no such person as Colonel Harold Phillips, named in Blum's book as chairman of the group. The CIA denied all knowledge of the UFO Working Group and insisted that the agency had not been involved with UFOs since the Robertson Panel Report was issued in 1953. The Department of Defence stated that there was no record of any committee, either official or unofficial, called the UFO Working Group, and that since the conclusion of Project Blue Book in 1969 there had been no official or unofficial investigation, study, or involvement in the matter of UFOs by any branch of the Armed Forces or the Defence Intelligence Agency.

Blum responded by pointing out that the existence of the group had been confirmed to him by four separate sources and that he had found support for their assertions in classified military documents seen by him. He then pointed out that the government had responded in exactly the same way - with ridicule - to his book about Nazis living in America... until the subsequent Congressional hearings had proved him right. He also said that he hoped his book would 'break the taboo about writing on UFOs' and that he thought there was 'a chance of getting Congressional hearings on why this work is being kept secret'.

There was, of course, a good reason for that secrecy. The US Air Force had insisted that UFOs did not exist, yet made the release of information about UFOs a crime under the Espionage Act. It claimed that national security was its only concern, yet ensured at the same time that its own air and ground crews would *not* report unidentified flying objects. And since killing off Project Blue Book in a gale of publicity, it has possibly convened, in the strictest secrecy, a UFO Working Group that meets once a month in the Pentagon to monitor UFO reports.

Clearly, since national security is not the issue, the US government was, and still is, protecting some secret knowledge: the reality of the man-made flying saucers.

Chapter 13

-

The Case Summed Up

If we go back to the first UFO sightings in the US, we can see that the technology of the late nineteenth century supports the contention that the Great Airship Scare of 1896-7 was caused by one or more genuine airships of advanced design, constructed secretly somewhere in the United States. The identity of the genius who designed them may never be known.

In the 1930s the first liquid-fuel rockets were constructed and flown by another American genius, Robert H. Goddard, in Roswell, New Mexico. Goddard's work was initially ignored by the US government, but adapted enthusiastically by the rocket scientists of Nazi Germany. Thus that country was soon leading the world in rocket technology and investing more than any other nation in advanced technology experimentation of all kinds. The existence of a Nazi 'flying saucer' program, Projekt Saucer, has now been proven. Press cuttings from the Imperial War Museum, London, and news agencies worldwide confirm that the 1945 reports of 'foo fighters' and 'balls of fire', were about a real, physical object which we now know to have been the German saucer-shaped anti-radar device, the *Feuerball*. Rudolph Schriever, Walter Miethe, and Georg Klein insisted separately that a larger, piloted version of the *Feuerball*, possibly named the *Kugelblitz*, was tested over Kahla, in Thuringia, which is in the immediate vicinity of Werner von Braun's underground V-1 and V-2 rocket establishment at Nordhausen. At the end of World War II, Schriever escaped and made his way back home to Bramerhaven where he insisted, to the day he died, that he had been involved in the German flying saucer project; Habermohl was captured by the Russians and taken back to work with other captured rocket scientists in the Soviet Union; and Miethe went with Werner von Braun to work for NASA, in the United States, but ended up working for A.V. Roe Canada (AVRO Canada).

The Soviets were the first to send a man into space, NASA was first at landing a man on the moon, and the first (known) man-made, completely saucer-shaped aircraft was the Avrocar developed by AVRO-Canada.

In the immediate post-war years Canada was one the greatest aeronautical

nations in the world. The first US-Canadian flying saucers were constructed at AVRO-Canada in Malton, Ontario. The first post-war UFO sightings, inaugurating the 'flying saucer' age, were made over the Cascade mountain range in Washington State, near the border of Canada, and the UFOs appeared to fly back in the direction of Canada (as was the case with the UFOs involved in the Washington DC 'invasion' of 1952). Because of this, Renato Vesco and others believe that there are hidden UFO bases in the vast, mountainous, wooded regions of southwest Canada, between British Columbia and Alberta, and that many of those UFOs land regularly, secretly on US military bases.

This may well be true, but another possibility, presents itself. The unworkable, unsigned flying saucer designs reproduced in *Brisant* magazine (see Foreword) were used to illustrate an unsigned article about Nazi flying saucers. The thrust of the article was this: the Captain Rischter naval expedition of 1938 had been for the purpose of finding a suitable ice-free area in Antarctic to be used as a hidden Nazi base after the war. This he found in a part of Queen Maud Land, which he claimed for Germany and renamed Neu Schwabenland. Throughout the war, the Germans sent ships and aircraft to Neu Schwabenland with enough equipment and manpower (much of it slave labour from the concentration camps) to build massive complexes under the ice or in well hidden ice-free areas. At the close of the war selected Nazi scientists and SS troops fled to Antarctica (this accounts for the Hitler and Martin Bormann 'escape' rumour), taking with them the technology required to complete the aborted Projekt Saucer. The Allies learned about this when a German U-boat surfaced at Mar del Plata four months after the war and its captain and crew were interrogated by Allied intelligence.

About a year after this, the Americans launched the biggest Antarctic expedition in history, Operation Highjump, led by the famous US explorer and naval officer, Rear-Admiral Richard E. Byrd. As Byrd's resources included thirteen ships, at least two sea-plane tenders, an aircraft carrier, six two-engine R4D transports, six Martin PBM flying boats, six helicopters, and a staggering total of 4,000 men, it was widely believed that the expedition was designed more as an assault force than as a simple exploratory expedition. It also seemed odd that when this virtual assault force reached the Antarctic coast, it not only docked, on 12 January 1947, near the German-claimed territory of Neu Schwabenland, but then divided up into three

separate task forces. When the expedition ended, in February the same year, reportedly much earlier than anticipated, there were numerous stories in the press about Rear-Admiral Byrd's references to 'enemy fighters which came from the Polar regions' and could 'fly from one Pole to the other with incredible speed'. The United States then withdrew from Antarctica for a decade.

During that decade, while the United States was keeping out of Antarctica, the US-Canada flying saucers came to light; and by 1954 the US press was informing the public that the Avrocar, or Omega, had been designed by John Frost for use in 'subarctic and polar regions'. This was followed, on 22 October 1955, by US Air Force Secretary Donald Quarles' references to 'aircraft of unusual characteristics' that would be used for 'the common defence of the subarctic area of the continent'.

The US finally returned to the Antarctic as part of the International Geophysical Year (IGY) of 1957-58, when it was inexplicably supported by the combined might of the USSR, Great Britain, and many other nations of the free world. After that, the US government announced that they were dropping their flying saucer projects; and eventually they also announced the termination of their UFO investigations program.

The same issue of *Brisant* contained another article, also without a byline, which insisted that Germany should claim back their rights to Neu Schwabenland, originally part of Queen Maud Land, still claimed by Norway.

The implication contained in these twinned articles was that at the close of the war certain Nazi scientists and troops fled to the Antarctic, via a friendly Argentina (as Hitler and Martin Bormann were rumoured to have done) to establish a secret UFO base hidden under the ice. The US, the Soviet Union, and other nations know about them and, having failed to dislodge them with Operation Highjump, are either cooperating secretly with them to share in their technology, or trying to defeat them by gradually taking over the Antarctic with the combined scientific might of the major powers and their allies.

Much of this theory can be traced back to a neo-Nazi group located in Canada. Taking note of the National Socialist leanings of the articles in *Brisant*, I checked the origins of the magazine and learned that it had been published in West Germany by a company that has long since disappeared

from its only known address: Lintec, GmbH, Jungfrauenthal 22, D-200, Hamburg 13. The company was not listed with any of the West German press organizations, nor with any public relations bureau.

None of the articles in *Brisant* carried bylines, but most of the information contained in them was originally published in the books, *UFO: Nazi Secret Weapons?* by Mattern Friedrich and *Secret Nazi Polar Expeditions* by Christof Friedrich. Neither book contains a copyright date, but both are published by Samisdat Publishers Limited, located at 206 Carlton Street, M5A 2L1, Toronto, Canada.

'Mattern Friedrich' and 'Christof Friedrich' are pseudonyms for one Ernst Zundl, an active neo-Nazi who appears to have many links with surviving Nazis in Argentina and elsewhere. He was once deported from the United States, and now runs Samisdat Publishers Limited as a mouthpiece of neo-Nazi propaganda and commercial enterprise, specialising in the sale of Nazi books, record albums, tape-recordings, photographs, medals, and other Nazi memorabilia.

Zundl's Antarctic-Nazi-UFO theories appear to have been culled from a variety of fanciful sources, most of them related to Vril (a secret society founded by a group of Berlin Rosicrucians and fiercely anti-Christian) and Thule mythology. However, his main source of inspiration may well have been Wilhelm Landig's *Götzen gegen Thule* (1971), described as 'a fiction full of facts' and promising the reader a wealth of information on 'secret military technology'. The similarities between this novel and Zundl's so-called 'factual' books are obvious.

The definitive analysis of the literary roots of Nazi-Antarctic-UFO theories can be found in *Arkto: The Polar Myth in Science, Symbolism, and Nazi Survival* (Thames & Hudson, London, 1993) by Joscelyn Godwin. In this seminal work *Götzen gegen Thule* is described as the story of two German airmen who are sent, near the end of World War II, to a secret base named Point 103, located in the most remote region of Arctic Canada. Though the existence of the base is not known to either the Allies or most German authorities, it is an immense underground complex supported by a technology far superior to anything else in the world. Travel in and out of the base is by the V7 - a vertical take-off aircraft shaped like a sphere, surmounted with a glass dome and propelled by a rotating ring of turbine blades. (Reportedly, a few prototypes of this very craft were actually

constructed in German and Czech factories towards the end of the war, but never put into production.) In the secret Arctic base, the two airmen are taken under the wing of a Waffen-SS officer who, becoming their guide and 'philosophical instructor', tells them about Thule, that original Aryan paradise located at the North Pole, not far from their secret base, Point 103. Apart from being racial supremacists, Thuleans are aware of an 'esoteric world-centre' of 'ethically positive forces' which manifests itself through phenomena known as Manisolas. Unlike the German 'disk-planes', the Manisolas are 'bio-machines' that materialise as 'disks' which, by night, 'shine in glowing or glossy colours, showing on occasion long flames at the edges and red and blue sparks, which can grow so strong as to wreathe them in fire'; by day they 'display an extremely bright gold or silver luminescence, sometimes with traces of rose-coloured smoke which then often condense into greyish-white trails'.

The rest of Landig's novel is taken up with the heroes' physical and philosophical adventures as they leave the underground polar base to travel the world and spread the Aryan gospel of Thule. In the course of this epic saga, Landig concocts a battle between Thule and Israel - between the 'white' Aryans and the 'dark' Jews - while also constructing an intricate whitewashing of the Nazis. These include the now familiar claim that the shocking pictures of piled-up, emaciated bodies in concentration camps were actually the stripped victims of Allied bombing raids being used for Allied propaganda purposes.

The combination of flying saucers and Aryan supremacy are not the only common denominators between the two authors. In Landig's 'Aryan' novel, his two German airmen are tasked with preventing the V7 flying saucer and its technology from falling into Russian or American hands in the face of the Allied advance. In Zundl's supposedly factual books, he has the German flying saucers destroyed in the BMW plant at Prague just before the plant was captured by the Russians.

In fact, the only real difference between the plot of Landig's novel and Zundl's Nazi-Antarctic UFO books is that Zundl changes his location from the North Pole to the Antarctic.

Like Landig, Zundl uses the Antarctic-Nazi-UFO fantasy to exaggerate the Nazi 'genius' in all things military and technological whilst simultaneously denying the true horrors of the Nazis' supposed great

achievements during World War II. Zundl, however, also uses information culled from a wide variety of articles published in European and South American magazines. These articles are, in turn, based on some rather intriguing facts relating to Nazis, Argentina, and the Antarctic in the immediate post-war months.

Submarine *U-977*, under the command of Captain Hans Schaeffer, certainly put out of Kiel harbour in the Baltic Sea on 25 April 1945, stopped in at Christiansand South on 26 April, left there the following day, and was not seen again until it surfaced at Mar Del Plata, Argentina, on 17 August - a period of nearly four months. We will now never know whether or not Schaeffer carried someone of 'political importance' in his submarine; nor will we ever find out why Allied Intelligence were so concerned about what the submarine might have been carrying or why they crewed it all the way back to the United States, only to blow it to smithereens. However, regarding that particular, epic voyage, it is certainly worth noting that Schaeffer had spent much of his career as submarine captain protecting the rocket research centres at Regen and Peenemünde, that he was particularly experienced at patrolling the South Atlantic and polar regions, and that he was one of a select group of naval officers who had been sent to the Harz Mountains to study the highly advanced XX1 electric submarines. (While there, he heard many rumours about imminent 'death rays' and other Nazi secret weapons.) In other words, Schaeffer was not only a man familiar with the secret projects of the Harz Mountains and Thuringia, but also one ideally suited to make the voyage to Antarctica.

Could Nazi scientists, soldiers, even slave-labour and valuable equipment have been taken to Antarctica in German submarines of that period? They could: a great number of passengers and a considerable amount of equipment could have been shipped in many submarines, in the course of many voyages, over a period of years, throughout World War II, when other Nazi boats and submarines were protecting the South Atlantic coastline of Antarctica. It is also worth noting that the normal U-boat could cover 7,000 miles on each operational cruise. Also, the Germans had submarine tankers spread across the South Atlantic Ocean at least as far as south of South Africa, and any one of those tankers, which had a displacement of 2,000 tons, could have supplied ten U-boats with fuel and stores, thus trebling the time

that those submarines could stay at sea.

It would also have been possible for the Germans to build self-sufficient underground research factories in Neu Schwabenland or other areas of Antarctica, as the Antarctic continent has many unexplored, ice-free areas, many of which are well hidden from view by vast ice sheets and mountains. Given the German genius for the construction of immense underground production plants and factories, it is not inconceivable that they could have done so in the Antarctic, using their own architects, builders, troops and captured labour. Indeed, most of the underground research centres of Nazi Germany were gigantic feats of construction, containing air-shafts, wind-tunnels, machine-shops, assembly plants, launching pads, supply dumps, accommodation for all who worked there, and adjoining camps for the slave workers - yet few German civilians knew that they existed.

As an example of the immensity of some of those hidden factories, Philip Henshall informs us, in *Hitler's Rocket Sites* (1985) that the wind tunnel at Peenemünde was then the most advanced in the world, containing its own research department, instrumentation laboratory, workshops and design office. Though the wind tunnel was undoubtedly the showpiece of the research complex, the full enormity of Peenemünde can only be gauged from the fact that apart from the wind tunnel, it also had 'its own power station, docks, oxygen plant, airfield, POW camp for specially selected prisoners who provided cheap labour, and social and medical facilities associated with a town of 20,000 inhabitants'. It was, therefore, the prototype for the even larger, mostly underground, factories to be built secretly in the mountainous ranges of Germany and Austria, notably at Nordhausen in the southern Harz mountain range of Thuringia.

This immense facility consisted of a series of linked tunnels carved out of the Kohnstein Mountain near the town of Nordhausen. The parallel tunnels were 1,800 metres long. Leading off them were fifty side-chambers, a main work area of 125,000 square metres, and twelve ventilation shafts which had been bored down from the peak of the mountain. Work at converting the tunnels into a mass-production facility for rockets began in September 1943 with the use of 2000 engineers and 15,000 inmates from the nearby concentration camps. The slaves were kept in a separate camp located in a hidden mountain valley, less than a kilometre from the entrance to the tunnel. A new underground complex, to be linked to Nordhausen by another network

of tunnels, was in the process of being built underground near the town of Bleicherode, twenty kilometres away, though it was not completed by the end of the war.

Known as the Nordhausen Central Works, the facility was placed under the command of Brigadier Hans Kammler, then head of building construction for the SS and later to be placed in charge of the V-2 rocket launchings against London. Similar large underground production plants were created at Wittringen, in the Saar, and near Liège.

Between them, Nordhausen and Bleicherode constituted the first of the SS underground factories - virtually living towns -and what the Nazis were doing there, under the earth, they also hoped to do elsewhere, including Antarctica.

Could the Germans have built such enduring structures underground? Almost certainly. A measure of their ability to do so may be gleaned from a glance at the statistics regarding the V-2 rocket launching site found near the forest of Eperlecques, three miles north of the village of Watten, on the canal network between the sea and the Belgium border. The reception area was housed in a gigantic concrete bunker that contained offices and accommodation for staff. The railway station had a five-foot thick roof. The launch-control tower for the rockets was approximately sixty-three feet by seventy-three feet and fifteen feet high. The enormous main building had been constructed from reinforced concrete and was 300 feet long, 138 feet wide, and had work levels 260 feet below ground; its roof was eighty feet high and made from twenty-three-foot-thick reinforced concrete. Theoretically speaking, to pierce it would have required a bomb weighing about twelve tons and striking the ceiling at a speed of Mach 1, the speed of sound. In order to construct this towering, bomb-proof edifice, the Germans needed 49,000 tons of steel and concrete for the roof alone. Hundreds of jacks were used to raise the roof slowly, inches at a time, with the walls being built up beneath it, as it was raised. The enormous amounts of steel, cement, sand and gravel needed were brought in from Watten on a standard gauge railway. The site took six months to construct and used about 35,000 slave workers, who came from the two prison camps located about a mile-and-a-half away. At any one time there were always 3000-4000 men at work. The work went on around the clock in twelve-hour shifts, and the slave labour, or *Sklavenarbeiter*, were controlled by armed members of the black-shirted SS

Totenkopfverbande, who had no hesitation in executing anyone too ill or exhausted to work.

It is clear from these examples that the Nazis were well skilled in constructing enormous structures, many located underground, with the help of slave labour. It is therefore possible that men and materials were shipped to the Antarctic throughout the war years; that during the same period the Germans could have been engaged in the building of enormous underground complexes in Neu Schwabenland similar to those in the southern Harz mountain range of Thuringia; and that the Soviet, US and British 'cover-up' regarding saucer sightings could be due to the fact that the Germans are still entrenched there in a master-slave colony devoted to highly advanced, aggressive technology.

The hypothesis of a hidden colony of the elite of Himmler's SS defying the combined might of Russia, the US, and other countries that have political and scientific interests in the Antarctic is interesting, but not the only possibility. While it is true that the Germans were involved in flying saucer construction programs during World War II, it is also a fact that the Canadians and Americans (despite official denials), perhaps with the support of the British, were engaged in similar projects, based on the captured German technology, with the aid of German scientists and engineers.

We know that at the completion of Rear-Admiral Byrd's Operation Highjump, the US inexplicably stayed out of Antarctica for a decade. We also know that during this period the US-Canada flying saucer construction projects came to light and were being considered for use in sub-arctic and polar regions. We know, further, that despite the so-called 'Cold War', the US, the USSR, and many other nations worked together, for a common cause, during the International Geophysical Year (NYG) of 1957-58. During that period of unprecedented, international, scientific cooperation, the main focus was on Antarctica and outer space, including the study of the magnetic field and the ionosphere.

These facts raise the possibility that the unique international cooperation still extant in Antarctica (and possibly elsewhere) is due to the need to protect an ongoing technology that has already moved well beyond an ethically acceptable state of advancement. As we have seen, the Nazis paved the way for morally unimpeded physical experimentation on human beings; and

modern science, in the shape of bio-cybernetic and genetic engineering experimentation, has shown itself willing and able to continue down this nightmarish path. If the desire for such experimentation is so great that legal, ethical and religious restraints must be ignored, that work would have to be, and could be, carried out in secret, in Antarctic, Siberia, the White Sands Proving Ground, or even in establishments hidden in the wilds of Canada.

It is to be assumed that a technology capable of creating the UFOs would also be highly advanced in other areas of experimentation, including bio-engineering and similar sciences of a nightmarish nature. If this is the case, there would be very good reason for keeping the results of such work, both scientific and medical, well hidden from the eyes of the world.

Russia (formerly part of the Soviet Union) has many defence and scientific establishments hidden underground, such as the immense laboratory at Semipalatinsk and others located in the desolate wastes of Siberia. The North American Air Defence Command (NORAD) is a top-secret complex of awesome proportions hidden inside the snowcapped Cheyenne Mountain near Colorado Springs, with parts of it a half-mile below the ground. During the war against Iraq in 1990 we learnt that beneath the streets of Baghdad are cavernous nuclear bunkers and enough command shelters and barracks to house thousands of Saddam Hussein's imperial guards. US Intelligence believes that the tunnels between the various complexes run for miles. Each complex is capable of holding 1200 people and has command posts, sick bays, sleeping accommodations, decontamination units, armouries, kitchens, and stores for dried food and water. Theoretically, there is enough space for nearly 50,000 people and the bunkers are covered, like the World War II German bunkers and underground factories, by enormously thick reinforced detonator slabs capable of withstanding the blast of 500lb bombs. Clearly, then, the construction of such complexes underground, in Antarctica or elsewhere, would present no major obstacles in this day and age.

Since the end of World War II, the *known* science and technology has made advances so astonishing that it is virtually in the realms of science fiction. If saucer-shaped aircraft were being developed that long ago and have continued to be developed in secret, behind closed doors, or underground, right up to the present day, they could now be extraordinarily advanced machines, being constructed, maintained and supported in hidden locations

by a mixture of human scientists, cyborgs, and other highly advanced man-machine products of a morally unrestrained, nightmarish technology.

Could such a massive undertaking be kept hidden for so long? The short answer is: 'Yes'. There has been no attempt to keep the flying saucers secret - only to keep the *technology* a mystery... and to humiliate, confuse, or terrify into silence those who have reported seeing the UFOs. Also, one can point to the fact that some of science's most startling discoveries were kept under wraps for as long as fifty years. Antibiotics were discovered in 1910, but not applied until 1940. Likewise, nuclear energy was discovered in 1919, but the general public was not informed about it until 1965. In short, no matter how big the secret, it could be protected for years.

We have only to think of the extraordinary innovations in today's science and technology, then recall that such miracles are merely the tip of the iceberg and that what goes on behind the guarded fences of our top-secret establishments is probably decades ahead of what we know about from official statements. Given this, the speed and capability of the UFOs are not beyond the bounds of possibility. Nor is it beyond reason that the UFOs rumoured to have landed on various military bases, both here and abroad, are the products of military-scientific projects so secret that only the personnel involved know about them.

The technology that began with the liquid-fuelled rockets of Robert H. Goddard in the 1930s, was adapted by the Nazis during World War II, and became the foundation of aerospace travel. It still continues and will not be stopped. The known capabilities of the F-117a Stealth night-fighter and the estimated capabilities of its likely successor, the Aurora, suggest that man-made craft are now the equal of those once reported only as UFOs. Parallel with this are the advances being made in transplant operations, plastic surgery, cloning and other forms of genetic engineering.

Most of this work takes place behind closed doors, but as all scientific, surgical and technological achievements are superseded and made public eventually, we might, in time, learn the truth.

Afterword

The here and now…

The technology described in the original *Projekt UFO*, much of it black technology, is still ongoing behind closed doors and cannot be stopped. The F-117a Nighthawk, or Stealth night-fighter, has already been superseded by the triangular-shaped B-2 Spirit bomber, designed and built for the Pentagon by Northrop. While most aspects of the B-2 remain secret, it is reportedly the world's most expensive aircraft and no less than *900* new materials and processes were developed to build it. Because of its 3-D computer-aided design and manufacture (CAD/CAM), it is the first aircraft in history to go from the drawing board to manufacture without the need for a prototype. The exact nature of its coating is still classified, but it is known to have been largely made from lightweight composites that render it invisible to radar and equally hard to detect with infrared, acoustic, electromagnetic and visual sensors. Requiring only a two-man crew, the B-2 is capable of flying for 6000 miles without refueling, at an altitude of 50,000 feet, with a top speed described by the Pentagon as 'high subsonic'. This makes it seem remarkably similar to the man-made flying saucers described in this book.

Perhaps the most legendary of them all is the Aurora, rumored to be another successor to the B-2. Though the existence of the Aurora has always been denied by the relevant authorities (and was categorically denied by Donald Rice, Secretary of the Air Force, in December 1992), it has been the focus of intense interest since its name first appeared in a US P-1, or procurement budget document, in 1985, listed directly below the SR-71 Blackbird and the U-2. Interest increased dramatically when the budget for Aurora for 1987 jumped abruptly from $8 million to 2.3 *billion*. Yet the following year the Aurora vanished entirely from the P-1, never to return again. Naturally this gave rise to even more speculation about the supposed aircraft's importance in the world of deep black technology.

Numerous reports in the aviation press and national newspapers claimed that the Aurora, approximately 115 feet long, 65 feet wide, 19 feet high, with short, swept-back wings, had a bat-like, or wedge-shaped, appearance when

viewed from one angle, a saucer-shape when viewed from another. It was believed to have one of four possible propulsion systems: Pulse Detonation Wave Engine, Ramjet, Scramjet, or regular Pulsejet. It could fly as fast as Mach 8, reaching anywhere on Earth in three hours.

In 1989, an oil-drilling engineer, Chris Gibson, also a member of the Royal Observer Corps, when working on an oil rig in the North Sea, saw what he believed might have been the Aurora refueling with a KC-135 Stratotanker and two F-111s. Certainly the drawing he did of the unusual airplane fitted the bill. During the same period, as reported in the first edition of *Projekt UFO*, there were numerous sightings of an unknown delta-shaped, supersonic aircraft flying in and out of RAF Machrihanish, located at the tip of the Mull of Kintyre, Scotland, jointly owned by the United States, and one of the most secret NATO air bases in Europe.

Belief in the existence of the Aurora increased when, in March 1990, despite having smashed the official air speed record from Los Angeles to Washington's Dulles Airport, the SR-71 Blackbird was inexplicably dropped by the Air Force. This instantly led to a widespread belief that the still top secret Aurora was taking its place.

That same year, a series of unusual sonic booms, resembling what the locals referred to as 'skyquakes', were recorded by at least twenty-five US Geological Survey sensors over Los Angeles and central California. To at least one seismologist, Jim Mori, the low rumbling sounds of the skyquakes suggested the sonic booms of an aircraft returning from an altitude of about 10,000 feet, or even from space. The general direction of the rumbling indicated that such an aircraft would be heading towards the test ranges in Nevada, where the top-secret Groom Lake (Area 51) test site is located.

During the period covered by the skyquakes, there were many sightings of a wedge-shaped, or triangular, seemingly supersonic airplane with short, sweptback wings, over California and Nevada, including Groom Lake. Nevertheless, while the sightings continued for many years, the authorities continued to categorically deny the existence of the Aurora. And though there were rumors to the affect that the plane had been canceled in 1986, there are many who believe that it still exists and is still operational, possibly as an unmanned, robotic craft. 'Aurora', some say, is an acronym for 'Automatic Retrieval Of Remotely Piloted Aircraft'.

So the Aurora at least exists as the most legendary UFO, or flying saucer,

of them all.

Definitely in operation is Northrop-Grumman's X-47 Pegasus UAV (unmanned aerial vehicle). This was rolled out on 1 July 2001 and flown for the first time in February 2003. A scaled-down version (27.9 feet long, 27.8 feet wing-span) of the B-2 Spirit, it looks remarkably like a flying saucer even when stationary, preparing for take-off from its aircraft carrier. Its successor, the X-47B, is expected to take its initial flight this year (2007).

Another man-made flying saucer look-alike is the LoFlyte, the product of joint research by NASA and the US Air Force. Described as triangular, wedge-shaped or resembling a 'flying manta ray', the LoFlyte has a 'waverider' design (first proposed by a British scientist, Terrence Nonweiler, in the early 1950s) that prevents air building up in front of it and slowing it down; instead, using flight-control software, it 'surfs' on a stream of air by wrapping the shock-wave generated by the high speed around the fuselage while trapping a cushion of air below it; thus, while in flight, it meets with no resistance and can attain speculative speeds of up to 3000mph. This seems very much like an extension of the 'boundary layer' theories proposed twelve years ago in *Projekt UFO*.

Beginning in 1990, there was a whole spate of unexplained reports of flat, wedge-shaped objects seen by pilots near air force bases in California and even as far afield as Belgium. Indeed, in Belgium there were over 2,000 sightings in a single year. In at least one instance, when two F-16 aircraft from the Belgian Air Force were sent to intercept a UFO; the resultant radar tapes showed a triangular shape descending from 10,000 feet to 500 feet in five seconds, indicating a speed of 2000mph. More dangerously, in 1995 a British Boeing 737 flying from Milan to Manchester was involved in a near-collision with a triangular UFO over the Pennines. The UFO was going so fast that the air crew ducked as it passed within feet of their aircraft - yet radar operators on the ground were unable to track it. When the crew of the 737, Captain Roger Willis and First Officer Mark Stuart, filed an official 'air near miss' report, the sketches they made of the mystery aircraft looked just like a wedge-shaped waverider. Regarding the remarkably high speed of the UFO, the waverider design of the Loflyte is said to be so fast that computer software (designed by the Accurate Automation Corporation of Chatanooga) is needed to *teach the aircraft to fly itself*, after basic instruction from a pilot.

Given the nature of black technology (by the time an aircraft has been

shown to the public, it has already been superseded behind closed doors) the public showings of the B-2 Spirit and the LoFlyte, which took place in the mid-1990s, are sure indications that even more advanced aircraft are already on the way. Said John Pike, director of space policy at the Washington-based Federation of American Scientists: 'The public showing of the LoFlyte vehicle is very odd. It leads me to the conclusion that there may well be classified work going on.'

Yes, there certainly was. Another flying-saucer-shaped prototype of the UAV variety was the DarkStar, America's latest spy plane. Fifteen feet long, sixty-nine feet wide, a mere five feet high, it was designed to carry the most advanced infrared and electro-optical spy cameras available, capable of taking pictures down to a resolution of one square foot, night or day. Again, that new prototype was constructed from 'lightweight, radar-absorbent materials' that would render it virtually 'invisible'. The second DarkStar, which looks even more like a flying saucer, completed its first test flight on 29 June 1998, taking off from the US Air Force Test Flight Center at Edwards AFB, California.

Not dissimilar is Lockheed Martin's unmanned, preprogrammed Venture Star, planned as a hypersonic reusable launch vehicle (RLV) and, again, shaped like a wingless 'wedge' or a 'flying manta ray'. The prototype was being built in 1996 at Lockheed Martin's legendary Skunk Works in California, for decades the birthplace of advanced and often highly secret aircraft; also an area renowned for its many UFO sightings.

Finally, in a 2003 report submitted to the President of the US by the Commission on the Future of the United States Aerospace Industry, it was stated: 'In the nearer term, nuclear fission and plasma sources should be actively pursued for space applications. In the longer-term, breakthroughs that *go beyond our current understanding of physical laws* [author's emphasis] such as nuclear fusion and antimatter, should be investigated in order for us to practically pursue human exploration of the solar system and beyond.' Clearly, therefore, this is where black technology is presently headed.

Further to such research, experimental work on a wide variety of special lightweight and radar-absorbent materials has certainly been going on and is related frequently to saucer-shaped designs. On 17 February 1996, *New Scientist* ran an article with the subheading: 'Hypersonic flying saucers

driven by microwaves; not science fantasy but the goal of serious researchers in the US.' The article ('Rider on the Shock Wave', by freelance writer Mike Ross) described experiments taking place in the engineering laboratories of the Rensselaer Polytechnic Institute in Troy, New York State. The experiments required the use of 'one of the few wind tunnels in the world that can produce shock waves at more than twenty-five times the speed of sound' and were designed to test an 'air spike': a device that would control the airflow around an aircraft, reduce drag to a bare minimum, and enable it to travel at many times the speed of sound while greatly reducing the temperature of its skin to the degree where it would require no thermal protection. The men behind the air spike were Leik Myrabo, an aerospace engineer at Rensselaer, and Yuri Raizer, a plasma physicist at the Moscow-based Institute for Problems in Mechanics, both working on funding from the Space Studies Institute in Princetown, New Jersey. Myrabo and Raizer were keen on 'saucer shaped' prototypes. By 1996 they were planning to make detailed measurements of the pressure and heat transfer around 'a disk' protected by an air spike as it sat in a flow of air traveling at up to twenty-five times the speed of sound. Myrabo's stated belief was that if the air spike could be made to work at that velocity, it could lead to 'a revolutionary new generation of lightweight, reusable launch vehicles that would resemble flying saucers and get their power from beams of microwaves or lasers.' In pursuit of this dream, he had already designed a new type of vehicle that was called a 'lightcraft' and 'shaped like a flying saucer'. He had also envisaged 'a system in which constellations of orbiting satellites would convert solar power into microwaves and beam them downwards to a lightcraft below. The lightcraft must have a large surface area to gather as much microwave power as possible, so a flying saucer shape is ideal.'

Other innovations relating to the kind of technology first mentioned in *Projekt UFO* (brain implants, thought transference, human and animal mutations, the 'invisibility' of advanced aircraft, magical metals such as *Luftschwamm*, or aero-sponge, and Nitinol, a 'metal with a memory') have been progressing at a rapid clip. There isn't enough space here to cover all the new innovations in detail, but here are a few random samples.

Regarding the 'magic metals' and 'invisible' metal surfaces, according to *Der Spiegel*, by 2002 a ceramic research laboratory in Dresden, Germany, had developed aluminum that was three times tougher than hardened steel of

the same thickness – and *transparent*. In the same vein, ‘cold plasma’ research presently being undertaken by research groups at Stanford, Princeton, Ohio State, Wisconsin and New York Polytechnic has the aim of shielding satellites and ‘other spacecraft’ by making them invisible to radar. Cold plasmas – analogs to the sophisticated defensive grids, or deflector shields, on the fictional *Star Trek*’s USS *Voyager* spacecraft – are ambient-temperature, ionized gases related to those found deep within the sun’s core. Such plasmas could not only make spacecraft invisible to radar, but could also prevent the frying of electronics or the melting of metal at above-supersonic speeds. Since in theory a plasma could deflect a particle-beam or laser attack, the US Air Force has allocated millions of dollars to low-temperature plasma studies with a view to protecting their space satellites.

As recently as 19 August 2007, journalist Peter Stothard was writing in the *Sunday Times* about 'a miracle material for the 21st century'. The new material is Aerogel. Though described as 'one of the world's lightest solids' (so light, indeed, that it is nicknamed 'frozen smoke'), Aerogel can withstand dynamite blasts and protect against heat of more than 1,300C. No surprise, then, that it is already being tested for bomb-proof housing and armour for military vehicles. No surprise, either, that NASA is already using it in the development of insulated space suits for the first manned mission to Mars (scheduled for 2018), where hopefully it will protect astronauts from temperatures as low as -130C. As Aerogel has also been described by scientists as 'the ultimate sponge', with millions of tiny pores on its surface, its resemblance to *Luftschwamm* would make it even more valuable as a material for future black-technology aircraft.

Regarding thought transference, by the late 1990’s the Institute of Medical Psychology in Tubingen, near Stuttgart in Germany, was engaged in experiments that proved that human beings could *think* images on a screen into moving in any direction they chose. The experiments were part of a program aimed at giving humans, possibly aided with microchip implantation, the power to control machines through thought alone. Military and commercial applications included, for instance, giving pilots the ability to fly aircraft and fire missiles by ‘electronic telepathy’, thus obviating the need for manual controls. The theoretical work on which the ‘chip grafting’ was being based was conducted by a group led by Greg Kovacs, professor of electrical engineering at Stanford University, California. It was mainly

concerned with ‘creating an interface between micro-electronics and the nervous system’. By 1995, the team had ‘learned how to fuse the device [the microchip] with nerve endings’. Among those reported to be keen on developing the technology was the Defence Research Agency in Farnborough, Hampshire, formerly part of the Ministry of Defence. The agency’s main interest was in ‘the operation of machines by mental control’.

Even as far back as 1995, the British Medical Association (BMA) was expressing concern at ‘how far the field has advanced’. A BMA ethics committee, set up to discuss the issue, was particularly concerned with the potential uses of microchip technology implanted in humans. Said Simon Davies, a legal expert and consultant to the BMA: ‘Big Brother is here and we never saw him coming.’ Who knows where such experiments, undertaken behind closed doors, have led since then?

Regarding human and animal mutations, the horrors mentioned in *Projekt UFO* have by now become almost routine. The Brave New Science of transgenics (taking sequences of DNA and either altering them and putting them back into the same species or, more controversially, introducing them into a different species) has in recent years moved away from purely animal experimentation into the human arena, with the planning of mutated and cloned human beings well on the way. Meanwhile, the scientific and commercial trade in human body parts, which played such a large role in my ‘Projekt Saucer’ fiction series and this non-fiction addition to it, has now become a major, legal industry, with the Chinese routinely exporting human fetuses for use in ‘traditional remedies and health foods’ and an American ‘supermarket’, the International Institute for the Advancement of Medicine (IIAM), selling human body parts, including brains, hearts, spines, liver, appendixes, testicles, knees, elbows (at least seventy-five body parts in all) for so-called ‘research’ purposes.

It is clear, then, that much of the speculative and documented information given in my bestseller, *Genesis*, published twenty-seven years ago and then expanded in the first edition of *Projekt UFO*, published twelve years ago, has stepped out of the world of fiction and into the realm of hard facts.

Nevertheless, despite these hard facts, the ‘extraterrestrial’ hypothesis regarding UFOs continues to dominate the media in general and the publishing world in particular. During the 1990s, in a desperate attempt to

replace the lurid sensationalism of the early UFO writers (Adamski, Däniken, Palmer, et al), publishers turned to a new breed of writers who could be accepted as 'serious' by lieu of their backgrounds, and who would, therefore, be automatically accorded more respect by a gullible public and media.

Leading the pack was Timothy Good, warmly embraced as a 'serious' UFOlogist because, as every press release reminds us, he was educated at The King's School, Canterbury and was, further, a professional violinist who 'gained a scholarship to the Royal Academy of Music, where he won prizes for solo, chamber and orchestral playing'. While it is difficult to imagine how a career as a professional violinist can lend credibility to the normally suspect study of UFOs, we are constantly reminded by Mr Good's publicity machine that he began his musical career with the Royal Philharmonic Orchestra, remained for fourteen years with the London Symphony Orchestra, played with the likes of Leonard Bernstein, Benjamin Britten, Igor Stravinsky, William Walton, and has been a session player for such pop luminaries as Paul McCartney, Elton John, Rod Stewart and the late George Harrison.

This distinguished musical background never fails to impress those interviewing Mr Good about UFOs and extraterrestrials. For this reason, he became an instant critical and commercial success with his first book, *Above Top Secret: The Worldwide UFO Cover-up* (1987). He then went on to write more UFO books and to be invited to lecture at 'universities, schools and… many organizations', including the Royal Canadian Military Institute, the Royal Naval Air Reserve Branch, the House of Lords All-Party UFO Study Group, and the Oxford and Cambridge Union societies. He was also invited for discussions at the Pentagon, lectured at the headquarters of the French Air Force, and even acted as a consultant for 'several US Congress investigations'.

Doubtless it was a combination of Good's 'respectable' middle-class background, good education, musical talent and undeniable skill as a public speaker that led to his early UFO books being accorded an unusual degree of respect, being praised in particular for the breadth of their research and the level-headed manner in which he was treating a notoriously controversial subject. Alas, as with most of those who make a full-time career out of UFO writing, Mr Good became ever more desperate to retain his readership and gradually drifted away from cool-headed reporting into the old Whitley Streiber *Communion*-styled claims of UFO abductions and extraterrestrial or

‘alien’ presences right here on Earth, as the titles of subsequent books clearly indicate: *Alien Bases: Earth’s Encounter with Extraterrestrials* (1998) and *Unearthly Disclosure: Conflicting Interests in the Control of Extraterrestrials* (2000). Mr Good, once highly touted as a ‘serious’ UFO researcher, has by now been reduced to hinting broadly during his lectures and in his more recent books that he, personally, might have been abducted by aliens. He is also selling the idea that the US Government has shrouded the UFO subject in secrecy to protect its ‘privileged contact’ with the extraterrestrials in our midst. Good’s main source of information for this dramatic hypothesis appears to come from accounts passed on by human ‘contactees’ who have, in turn, received their information from friendly humanoid aliens. No attribution required.

A more recent addition to the ‘serious’ pack is Nick Pope, whose main claim as a credible UFO researcher and writer is that he spent twenty-one years with the MoD (Britain’s Ministry of Defence) and, more importantly, worked for three of those years (1991-94) as the MoD’s UFO Desk officer. During that particular period, he researched and investigated: ‘UFO sightings, alien abductions, crop circles, animal mutilations and any other weird and wonderful reports that came my way’. Given this supposed wealth of ‘official’ UFO information, not normally available to the common man, Pope was able to produce his first ‘serious’ UFO book, *Open Skies, Closed Minds* (1995). Sold with the shout line, ‘For the first time a government UFO expert speaks out!’, the book successfully launched Pope’s career as another UFO writer with a ‘credible’ background., leading to a secondary ‘Timothy Good’ styled career as lecturer, documentary film producer, and general UFO pundit on a wide variety of radio and television programs. His writing career continued with a second nonfiction book, *The Uninvited: An Expose of the Alien Abduction Phenomenon* (1997) and two UFO/alien abduction novels. Finally, when the media began comparing Pope’s MoD UFO revelations with ‘The X-Files’, he became widely known as ‘the British Fox Mulder’.

In November 2006, emboldened by his success as a writer, lecturer, ‘UFO authority’ and ‘the British Fox Mulder’, Pope resigned from the MoD and went on to star in a DVD movie entitled *NICK POPE: The Man who Left the MOD*. In the documentary, he discusses, amongst other things, Russian and Black Technology, the Rendlesham Forest Incident, Quantum Physics, Psychology, and Government reports and sightings by insiders. According to

the Reality Films press release, 'Nick Pope is probably one of the best known UFO investigators on the planet. And yet, he is the only official UFO investigator employed by the British Government to ever go on record.'

Alas, as early as 1999, grave doubts were being cast on Pope's actual position within the MoD and on how much of his work at that establishment had actually been related to UFO researches. Starting to suspect that Pope's supposed MoD UFO reports were 'fiction disguised as reality', James Easton, Editor of *Voyager On-line*, wrote to the MoD for clarification regarding the work Pope actually did there. According to Easton, he received a reply from the Ministry, stating: 'Mr Pope was employed as an Executive Officer in Secretariat (Air Staff) 2… The main duties of the post concern non-operational RAF activities overseas and diplomatic clearance for military flights abroad… A small percentage of time is spent dealing with reports from the public about alleged "UFO" sightings and associated press correspondence… The Ministry of Defence has not investigated a case of alien abduction, crop circle formations or animal mutilation.'

Of course, the fact that the MoD has categorically refuted Mr Pope's high claims regarding his position there does not necessarily mean that the MoD is telling the truth; nevertheless, their clear indication that Mr Pope had not been involved as extensively with UFO sightings as he had claimed caused ripples of discontent in many a UFO circle. Nevertheless, Pope continued to sell himself as the 'British Fox Mulder' of 'serious' UFO investigators and writers. However, just like Timothy Good, he swiftly moved from a position of healthy skepticism about extraterrestrial UFOs to a declared belief in the reality of alien intervention on Earth. And, like Good, he even began hinting, by way of half-hearted denial of 'leaks' to the media, that he had, himself, once been taken aboard a UFO.

According to journalist Mark Macaskill, writing in the *Sunday Times* of 16 February 1999, Pope, during his tenure as the MoD's UFO Desk officer, had gone from skepticism to belief not only because of what he had learned there, but also because he was 'holding back part of the reason for his personal convictions'. The reason, apparently, was that in *The Uninvited*, Pope's second UFO book, his story about the UFO abduction of a couple named 'Peter and Jenny' was actually about himself and his girlfriend of the time. Reportedly, 'Peter and Jenny', while driving along a road in Florida, some time prior to 1992, suddenly found themselves several miles away on a

different road. Not being able to account for this seemingly impossible jump from one place to the next, a disturbed Pope later underwent hypnosis and recalled, in the hypnotic state, that he and his girlfriend had been 'lifted into the air' and then taken aboard an alien spacecraft. 'He remembered wandering along its metallic corridors, though he says he doesn't recall meeting any aliens. He now says it was the strangest event of his life.'

While Macaskill didn't say precisely how he knew Pope was actually writing about himself, disguised as 'Peter', and while he made it clear that Pope had neither confirmed nor denied the bizarre story, he *did* state that Pope had fictionalized his real-life experience because he was 'worried about implicating the woman called "Jenny" in the book; a woman who was then, but is no longer, his girlfriend.'

Whether true or false, whether or not Pope had actually given this story to Macaskill, the story offered a platform for Pope's move from skepticism to his apparent belief in the reality of extraterrestrial UFOs and alien abductions. Always a good man with a denial that hints at its opposite, Pope continued to keep his lips sealed about the story of his own abduction by a UFO while frequently implying that the MoD, which had failed to support his claims about the importance of his position with them, was now denying any interest in UFOs or alien abduction reports in order to conceal their own dealings with aliens operating on, or threatening, Earth.

By 2007, though Pope had produced no more UFO books of his own (he only wrote a couple of introductory texts for other UFO authors), he was appearing regularly on television, taking part in numerous radio programs, and lecturing at a wide variety of UFO conventions. By this time, he not only appeared to have moved completely from skepticism to belief, but was even complaining that the MoD UFO project had been 'virtually closed down', leaving the country 'wide open' to the possibility of an alien invasion.

'There has got to be the potential for that,' he was quoted as saying in the *Daily Mail* of 10 November 2006, 'and one is left with the uneasy feeling that if it turned out to be so, there is very little we could do about it.'

Yet despite what Pope and Good say to the contrary, there has not been the slightest hard evidence for extraterrestrial craft landing on Earth or for alien beings interacting with humans. It should be noted, however, that the most astounding and perplexing science of the past decade – quantum physics – may have produced the nearest we have come to an explanation for the

many seemingly real experiences that thousands of perfectly sane people insist that they have had with UFOs and/or extraterrestrials.

We are reminded by Phil Patton, in his marvelous book, *Dreamland* (Villard, New York, 1998) that some of the world's most respected physicists, in discussing the paradoxes of quantum theory, have raised the possibility of parallel or multiple universes and space-time 'wormholes' that make time-travel a theoretical possibility. Says Patton: "According to quantum theory, subatomic particles could apparently be in several places at once…Or, more to the point, a subatomic particle that is *here* in one universe might be *there* in its neighbor." Given this scenario, it is not beyond the bounds of probability that the more extreme or 'dreamlike' UFO sightings and extraterrestrial 'contactee' experiences could be, in the words of UFO photographer Kathleen Ford, confrontations with 'interdimensional entities', or, in Patton's words, 'creatures from other realms of space-time'. If this idea seems far-fetched, it has, as Patton says, 'roots in mainstream physics' and it certainly has, indeed, been presented as a viable proposition by the reputable physicists David Deutsch and Fred Alan Wolf. In *The Fabric of Reality: The Science of Parallel Universes – And Its Implications*, (Allen Lane/Penguin, 1997), Deutsch speculates that all of twentieth-century physics points to parallel universes. In *Parallel Universes* (Touchtone/Simon & Schuster, 1988), Wolf speculates that parallel universes could be the source of dreams, visions, schizophrenia, and… UFO sightings.

So the countless cases of normal people recollecting UFO/extraterrestrial experiences could be explainable within the scientifically possible, albeit bizarre, parameters of quantum physics, rather than proving that flying saucers, piloted by aliens, have landed on Earth.

Interestingly enough, the most recent attempt to make UFO writing 'serious' and 'respectable' came in the form of the only book, apart from my own, to suggest that UFO sightings might be related to experimental man-made craft. *The Hunt for Zero Point* (2002) received a lot of publicity because it was written by Nick Cook, Aviation Editor for the 'esteemed' *Jane's Defense Weekly*, the bible of the defense establishment and highly respected for its 'no-nonsense, nuts-and-bolts' reporting. Subtitled, 'Inside the Classified World of Antigravity Technology' Cook's book treats as a totally new concept the possibility that the US Government confiscated secret Nazi anti-gravity technology at the end of World War II and later may have

tested it in experimental aircraft. Some of that technology, Cook claims, probably made its way into the B-2 Stealth bomber and may account for the rash of post-war UFO sightings.

I have to confess that I took great personal offense at this book, particularly when one reviewer wrote: 'So even if Nazi flying saucers sound nutty on the face of it, there's nothing crazy about Cook asking the questions he does. You might even call it courageous.'

Courageous? In fact, the spinal column of Cook's book was almost certainly formed from information to be found in my bestselling novel, *Genesis*, first published way back in 1980, in my World War II 'Nazi UFO' novel, *Inception*, published in 1991, and in the first edition of my nonfiction work, *Projekt UFO*, first published in 1995. Certain of Mr Cook's supposedly original ideas can also be found scattered throughout my five-volume 'Projekt Saucer' fictional series, published between 1991 and 1999. (*Inception*, *Phoenix*, *Genesis*, *Millennium*, *Resurrection*.) As for SS General Hans Kammler's involvement with Nazi flying-saucer construction projects and the US Navy's involvement with their own flying saucer research programs – both of which Mr Cook breathlessly claims to be his own discovery – they were in fact first brought to public attention through two of the above mentioned books, namely *Genesis* and *Inception*.

Even more offensive to me was the way in which Mr Cook, while selling his book as a serious technical study of the dubious evolution of workable anti-gravity programs based on Nazi technology, writes not in the cool, objective tone of a former *Jane's Defense Weekly* Aviation Editor, but in the breathless style of a second-rate thriller writer. Thus, when his 'research' first leads him to the knowledge that the SS was in charge of the most secret Nazi technology (as first revealed by this author nearly thirty years ago), Cook feels 'a constriction in my throat. I was so keyed, my breath was coming in short, sharp gasps.'

More likely he was simply breathless from reading my novels and factual book, none of which were credited in the main text of his supposedly original tome, though the original edition of *Projekt UFO* was at least listed in his bibliography.

However, personal gripes aside, *The Hunt for Zero Point* can be credited with bringing the possibility of man-made UFOs and other secrets of black research programs back to public attention after all these years, particularly

with regard to the still problematical anti-gravity programs.

Rereading *Projekt UFO* twelve years on, I find myself still harboring doubts about certain aspects of it, notably the speculative underground colonies in the Antarctic (though they were certainly *physically* possible and anything *is* possible); but in the main I am struck by how accurate, not to say prophetic, most of the factual material, though considered speculative at the time, has turned out to be.

While the possibility of underground Antarctic UFO research facilities remains problematical, there can be no doubt that similar facilities, many of them vast, all of them highly secretive and dedicated to black technology, including the creation of bizarrely-shaped experimental aircraft, exist in a wide variety of known or rumored locations. Such top-secret facilities are to be found in Dulce and White Sands, both in New Mexico, in Tehachapi (known as 'the Anthill') and Helendale, both in California, and even in Bascombe Down, in the UK. While the American sites, in particular, have been widely credited with harboring aliens, or 'humanoid aliens', engaged in highly advanced technological experiments, including the surgical mutation of abducted human beings, the most famous site of all, Area 51, is more realistically recognized as the very hub of America's black technology.

Also known as Groom Lake, Dreamland, Paradise Ranch, and Home Base, Area 51 consists of approximately 4,742 square miles of restricted airspace and nearly four million acres of bomb range located in the Emigrant Valley of southern Nevada, close to Las Vegas, hemmed in by the Nellis Air Force Range and the Nevada Test Site, in an area of parched, windblown desert and lunar-like dry lakes. For years its very existence was denied by the US Government, but it came to the attention of the public in 1962, when the first Soviet spy satellite began orbiting Earth. Shortly after this momentous, threatening event, the existence of the fabled supersonic AF-12 Blackbird fighter, frequently observed flying over Area 51, was officially acknowledged as a desperately needed US propaganda exercise.

Nevertheless, Area 51 remains an area so secret that unwanted visitors are warned off with signs stating, '*Deadly force authorized and photography prohibited*.' Helicopters routinely sweep its borders to either sandblast intruders with the downwash from their rotors or pick them up and arrest them. Indeed, it is an area so secret that even the fighter pilots flying in and

out of nearby Nellis Air Force Base are forbidden to enter its airspace. Because of this extraordinary security, the area is one of particular fascination for those interested in black or 'stealth' technology. That interest grew phenomenally when one Bob Lazer, a man with a seriously checkered background, known to some as a professional con artist, claimed that he had seen and worked on flying saucers in an area known as S-4, at Papoose Lake, south of Groom Lake. However, even as the hordes of sky-watchers who then swarmed to the area were seeing 'mysterious lights' and UFOs, it became clear that Area 51 was in fact the top-secret, black technology site where the SR-71 Blackbird, and, most famously, the triangular F-117 Stealth fighter plane (both of which were often mistaken for flying saucers or, at least, triangular-shaped UFOs) were first constructed and flown. It was also the site most often mentioned in regard to the highly speculative Aurora and Black Manta prototypes. At the very least, it was, in the words of one sky-watcher, the place where 'we are testing vehicles that defy description, things so far beyond comprehension as to be really alien to our way of thinking.'

'UFO' is an acronym for Unidentified Flying Object(s) and many of the experimental craft observed over Area 51 were definitely of unusual, even bizarre, configuration, including shapes that resembled flying saucers. The bat-shaped F-117 Stealth fighter was certainly such a craft and its rumored successor, the Aurora, had, as we have noted above, a similarly unorthodox appearance. Thus, while its existence was being officially denied, the Aurora, when sighted by sky-watchers during a test flight, would have justifiably been described as a UFO.

And it has to be repeated that despite the 'extraterrestrial' or 'alien' theories put about by writers such as those mentioned above, the UFO sightings of the period covered by *Projekt UFO* were almost certainly caused, not by alien spacecraft, but by the experimental aircraft that preceded the supersonic, 'radar invisible' Stealth fighters, the 'otherworldly'-shaped UAVs (no cockpits, no windows, no wings or fins; bat-shaped, saucer-shaped or doughnut-shaped), and the even more contemporary prototypes mentioned at the beginning of this introduction: the secret products of an ongoing black technology.

Even the Roswell Incident of fifty years ago, which could reasonably be said to have started the UFO age (along with the Kenneth Arnold sightings of

the previous month), can now be attributed to the early days of black technology. While that particular incident has spawned more than three dozen books, hundreds of television documentaries or program segments, thousands of pages of press speculation, serious accusations of a massive and far-reaching government conspiracy, at least one complex hoax (the Ray Santilli 'alien autopsy' film) and a made-for-TV movie, no definite confirmation for what crashed in Roswell, New Mexico, on 7 July 1947, has so far come to light. Yet an increasing body of evidence supports the theory that it was some kind of man-made flying device.

Over the years, various kinds of balloons have been suggested, with the official explanation changing at least two times. First, as recounted in *Projekt UFO*, the military claimed that what crashed was a Rawin weather balloon – but a simple weather balloon could not account for the kind of debris reportedly found at the crash site. Next, on 8 September 1994, following pressure from Congressman Steven Schiff of New Mexico, the US Air Force issued an official statement that laid the blame on a 'high altitude' balloon of the kind used in a secret program known as Project Mogul. This may, indeed, have been the case.

Project Mogul's task was to detect Soviet nuclear tests by using sensitive instruments carried aloft by high-altitude balloons. Some of those balloons were launched from the Roswell Army Air Field.

According to Professor Charles B. Moore, then working at the Langmuir Laboratory for Atmospheric Research in Socorro, New Mexico, and the man in charge of balloon launches in the Roswell area, the Mogul balloons carried a new kind of monitoring instrument, designated the ML-306. The device utilized aluminum foil and wax paper, with balsa-wood beams and reinforcement tapes that were painted with various markings. Those markings, probably scientific symbols, were described by Air Force Major Jesse A. Marcel, placed in charge of the crash debris, as 'hieroglyphics'. (Marcel's unfortunate use of that word, so suggestive of mysterious races – as well as his growing conviction that what had crashed was not of this world – was almost certainly influenced by Kenneth Arnold's sensational UFO sightings of the previous month. Thus, the 'hieroglyphics' were soon taken up by cultists as the letters of 'extraterrestrial' or 'alien' writing.) Also, Professor Moore insists that the Mogul balloons used for that particular project were made from neoprene, instead of the customary polyethylene.

When the cluster of balloons expanded at high altitude and then burst, falling back to earth, Mac Brazel, the rancher who found the wreckage, described the debris as being 'smoky-gray in color'. This, says Professor Moore, is exactly how he personally would have described the color of neoprene balloons that had been stretched, as they would have been at high altitudes.

So the Mogul balloons *might* have been what crashed at Roswell, New Mexico.

However, a more intriguing possibility was raised in the November 2000 issue of *Popular Mechanics*. In an article entitled 'America's Nuclear Flying Saucer', author Jim Wilson recounts that among America's various top-secret projects of the time was an unmanned 40-ft 'flying saucer' designed to rain nuclear destruction on the Soviet Union (now Russia) from 300 miles up in space. Designated the Lenticular Reentry Vehicle (LRV), designed for the US Air Force by engineers at the Los Angeles Division of North American Aviation, and managed by Wright-Patterson Air Force Base in Dayton, Ohio (where German engineers who had worked on Nazi rocket and flying disk projects had been resettled, and over which, at the time, many UFO sightings were made), the LRV could have been powered by one of the nuclear rockets then under development by the Air Force and the Atomic Energy Commission or, as an alternative, lifted into the stratosphere by a 'heavy-lift balloon'. According to the Air Force, such balloons were capable of lifting 15,000-pound payloads to 170,000 feet.

In 1997 the Air Force revealed details of several heavy-lift balloon research projects and stated that during the Cold War it had routinely used them to lift 'unusual airframes' for aerodynamic tests. It should therefore be borne in mind that the test flight of an LRV could, as Jim Wilson reminds us, 'certainly match the classic UFO reports of a silvery disc hovering motionless in the sky, then silently shooting upwards'.

So an LRV of the kind described above could be another explanation for what crashed that fateful day in Roswell, New Mexico.

Either way, if what crashed at Roswell was related to a top-secret aeronautical or defense project, the official response would have been to ensure that the general public did not learn about it. The best way to do that would be the spreading of carefully plotted disinformation. This may explain why, fifty years after the event, the many questions raised by the Roswell crash have never been fully answered.

What we can, however, say with conviction, is that what crashed at Roswell in 1947 was, like most of the other sightings classed as UFOs, almost certainly man-made.

There the case rests.

Chariots of the Gods? (Souvenir Press, London, 1969; Corgi, London, 1971) by Erich von Däniken and *The Spaceships of Ezekiel* (Corgi, London, 1974, Bantam, New York, 1979) by J.F. Blumrich, are the two major books on the 'ancient astronaut' hypothesis. A healthy antidote to von Däniken's view of the intelligence of the technocrats of the ancient world is to be found in *Ancient Engineers* (Souvenir Press, London, 1963; Tandem, London, 1977) by L. Sprague de Camp. The most detailed criticisms of von Däniken in particular and the 'ancient astronauts' hypothesis in general are to be found in *Crash Go The Chariots* (Lancer Books, New York, 1972) by Clifford Wilson and *The Space Gods Revealed* (New English Library, London, 1978) by Ronald Story.

The earliest article about the German 'foo fighter' was published in the *South Wales Argus* of December 13, 1944. An Associated Press release by Marshall Yarrow (Reuters special correspondent at Supreme Headquarters, Paris, France) was published in the New York *Herald Tribune* of January 2, 1945. Another article was published in the London *Daily Telegraph*, also on January 2, 1945.

Information about Nazi Germany's 'Projekt Saucer' and related flying saucer projects, including the Flying Flapjack and the Avrocar, or Omega, was found in the following newspaper and magazine articles: 'Untertassen - Flieger Kombination', *Der Spiegel*, March 30, 1950. 'Flying Saucers - The Real Story', *US News & World Report*, Volume XXVIII - No. 14, April 7, 1950. 1947/48 einwandfrei beobachtet', *Das neue Zeitalter*, February 6, 1965. 'Deutsche Flugkreisel', *Luftfahrt International*, No. 9, May-June, 1975. 'Mit UFOs zu neuer Gravitationstheorie', *Kurier*, November 20, 1976. 'Biotechnische Schriftenreihe', *Implosion*, 'Biotechnische Schriftenreihe', Vol.No. 25. 'Fliegende Teller statt Hubschrauber', *Hobby*, December 14, 1977. 'The Question Mark Above Our Heads', *Out of This World*, (Editor Perrott Phillips; Gravitic propulsion system designed and drawn by John Batchelor), a Phoebus partwork, Vol 1, 1978. 'Fliegende Scheiben und Viktor Schauberger', *Kosmische Evolution*, No. 4, 1979. 'Prototypen der Kreisflügler AS 6 V 1', *Luftfahrt International*, No. 4/ 1979. 'Nitinol, the Magic Metal', is an uncredited article published in *Science Now*, a Marshall Cavendish partwork, Vol 1, Part 2, 1982. The views of the German physicist Dr Eduard Ludwig were extracted from an undated, declassified Central Intelligence Agency document SO DB 27143, entitled ‘The Mystery of the Flying Disks: A Contribution to its possible explanation’.

UFO-related articles by W.A. Harbinson on the ‘hollow Earth’ theory and Captain Richard E. Byrd's Antarctic expeditions were published in *The Unexplained*, an Orbis partwork, Vol. 2, issues 27 and 28, 1981. Articles by W.A. Harbinson about the man-made UFO were published in *The Unexplained*, Vol. 4, Issues 37 and 38, 1981.

Books on rocket and aircraft development include: *Soviet Rocketry* (David & Charles, Newton Abbot, 1971) by Michael Stoiko. *Robert H. Goddard: Pioneer of Space Research* (De Capo Press, New York, 1988) by Milton Lehman. *The Papers of Robert H. Goddard* (McGraw-Hill, New York, 1970), edited by E.C. Goddard. *The Birth of the Missile: The Secrets of Peenemünde* (Harrap, London, 1965) by E. Klee and O. Merk. *German Guided Missiles* (Ian Allan, London, 1966) by R. F. Pocock. *V2* (Hurst and Blackett, London, 1954) by Walter Dornberger. *Hitler's Last Weapons: The Underground War Against the V1 and V2* (Julian Friedmann, London, 1978) by Jozef Garlinksi. *Hitler's Rocket Sites* (Robert Hale, London, 1985) by Philip Henshall. *Raketon-Flugtechnik* (Edwards Press, Ann Arbor, Michigan 1945; reprint of 1933 edition, published by Oldenbourg of München) by E. Sanger. *Alsos* (Schuman, New York, 1947) by Samuel A. Goudsmit. *From Hiroshima to the Moon* (Simon and Schuster, New York, 1959) by Daniel Lang. *Rockets, Missiles, and Spacecraft of the National Air And Space Museum* (Smithsonian Institution, Washington D.C., 1976/1983) compiled by

Gregory P. Kennedy.

The indispensable book on the development of disc-shaped aircraft is *Intercettateli Senza Sparare* (E. Mursia & Co., Milan, Italy, 1968) by Renato Vesco. This was later published in an English translation by Grove Press, New York (1971) under the title *Intercept - But Don't Shoot*, then reissued in 1974 by Zebra Publications, New York, as *Intercept UFO*. Unfortunately it has been out of print for years. *German Jet Genesis* (Janes Information Group, Surrey, 1982) by David Master, contains a section of Projekt Saucer. A short but decent article on Projekt Saucer and related projects is *German Secret Weapons of World War II* (Neville Spearman, London, 1959; the Philosophical Library, New York, 1959) by Major Rudolph Lusar. Most of Lusar's article is reproduced with other German flying-saucer material and considerable wishful thinking in *UFOs: Nazi Secret Weapons?* (Samisdat, Toronto, Canada, undated) by Mattern Friedrich, aka Ernst Zundl.

The most comprehensive studies of the UFO phenomenon as a whole are *The UFO Controversy in America* (Signet, New American Library, New York 1975) by David Michael Jacobs; and *UFO Exist!* (Ballantine, New York, 1976) by Paris Flammonde. Both of these books include detailed accounts of the Great Airship Scare of 1896-97. *The UFO Encyclopaedia* (Corgi, London, 1981) by Margaret Sachs, is exactly what it claims to be, and this book could not have been written without it. *The Report on Unidentified Flying Objects* (Doubleday, New York, 1956) by former Project Blue Book head, Captain Edward J. Ruppelt, is the classic book of its period; and its natural companion is *Project Blue Book* (Ballantine, New York, 1976), edited by Brad Steiger. For purely scientific, or pragmatic, examinations of the phenomenon, one can do no better than Dr J. Allen Hynek's authoritative works, *The UFO Experience: A Scientific Inquiry* (Abelard-Schuman, New York, 1972; Corgi, London, 1974) and *The Hynek UFO Report* (Dell, New York, 1977; Sphere, London, 1978). Also recommended in this category are *Phenomenon* (Futura, London, 1986), which is a collection of articles from the files of BUFORA (the British Unidentified Flying Object Research Association) edited by John Spencer and Hilary Evans. BUFORA's director of field operations is Jenny Randles, an admirably objective writer on the subject (though she did not agree with the premise behind *Genesis*), whose *UFO Study* (Robert Hale, London, 1981) is the best guide in print for DIY (Do It Yourself) UFO researchers.

Other UFO books relevant to this subject are: *UFOs: A Scientific Debate* (Norton Library, New York, 1974), edited by Carl Sagan and Thornton Page. *The Crack in the Universe* (Neville Spearman, Jersey, 1975) by Jean-Claude Bourret. *UFOs From Behind the Iron Curtain* (Souvenir Press, London, 1974) by Ion Hobana and Julien Weverbergh. *The Interrupted Journey* (Berkley Medallion, New York, 1974) by John G. Fuller. *Beyond Earth: Man's Contact with UFOs* (Corgi, London, 1974) by Ralph Blum with Judy Blum. *The Humanoids* (Neville Spearman, London, 1969; Futura, London, 1974/77), which is a compilation of articles from *Flying Saucer Review*, edited by Charles Bowen. *Celestial Passengers: UFOs & Space Travel* (Penguin, London, 1977) by Margaret Sachs and Ernest Jahn. *Socorro Saucer* (Fontana, London, 1976) by Ray Stanford. *The Roswell Incident* (Granada, London, 1980) by Charles Berlitz and William Moore. *Above Top Secret* (Sidgwick & Jackson, London, 1987) by Timothy Good. *Out There* (Simon & Schuster, London, 1990) by Howard Blum. Finally, I am indebted to Phil Patton's *Dreamland* (Villard, New York, 1998) for the essential details of Area 51 and its place in the mythology of UFO and 'stealth' sightings.

Useful private press publications were: *UFO Landings Near Kirtland AFB* (William Moore Publications & Research, Burbank, California, 1985) by Bruce Maccabbe, with comments by William Moore. *The Riddle of Hangar 18* (Global Communications, New York, 1981) by Timothy Green Beckley. *Crashed UFOs: Evidence in the Search for Proof* (Publication No. F-258) by William Moore.

The indispensable book on UFO technology is *UFOlogy* (Celestial Arts, California, 1976) by physicist James M. McCampbell. Articles on the subject, and related articles, are to be found in the excellent *Worlds Beyond* (An/Or Press, the New Dimensions Foundation, Berkeley, California, 1978), edited by Larry Geis and Fabrice Florin, with Peter Beren and Aidan Kelly. Technical terms were clarified with the help of *The Dictionary of Space Technology* (Frederick Muller, London, 1982) by Joseph A. Angelo, Jr. Information on CAMS, cyborgs, other man-machine interactions, and general bio-engineering and various nightmarish experiments was found in: *As Man Becomes Machine* (Abacus, London, by David Rorvik. *Man Modified* (Paladin, London, 1969) by David Fishlock. *The People Shapers* (Futura, London, 1978) by Vance Packard. *Manipulation* (Fontana, London, 1975) by Erwin Lausch. *The Immortalist* (Panther, London, 1973) by Alan Harrington.

PSI: Physic Discoveries Behind the Iron Curtain (Abacus, 1977) by Sheila Ostrander & Lynn Schroeder. *Future Science* (Anchor Books, Doubleday, New York, 1977), edited by John White and Stanley Krippner. *Robots: Fact, Fiction and Prediction* (Thames and Hudson, London, 1978) by Jasia Reichardt. *The Science in Science Fiction* (Michael Joseph, London, 1982) by Peter Nicholls. *The Modern Frankenstein* (Blandford Press, Dorset, 1986) by Ray Hammond.

For many crossover subjects relating to scientific and paranormal matters, I used that indispensable and fascinating desk companion, *The Directory of Possibilities* (Webb & Bower, Devon, 1981), edited by Colin Wilson and John Grant.

U-Boat 977 (William Kimber, London, 1952) by Heinz Schaeffer includes that submarine commander's personal account of his final voyage to Argentina. The Hollow Earth (Citadel Press, New Jersey, 1969), by Dr Raymond Bernard is the standard, but hardly credible, book on this bizarre theory. Another book, *This Hollow Earth* (Sphere, London, 1972) by Warren Smith, is even less credible. *Secret Nazi Polar Expeditions* (Samisdat, Toronto, undated) by Christof Friedrich, alias Ernst Zundl, is a neo-Nazi view of this subject which, combined with the aforementioned *UFOs: Nazi Secret Weapons*, by the same author writing under a different pseudonym, is almost certainly responsible for the articles published in the neo-Nazi magazine, *Brisant*, in May 1978. The literary sources for the many Nazi-Antarctic-UFO theories are well covered in *Arktos: The Polar Myth in Science, Symbolism, and Nazi Survival* (Thames & Hudson, 1993) by Joscelyn Godwin.

Information on United States knowledge of, and concern about, man-made UFO was found in declassified US Air Force and other intelligence documents made available through the Freedom of Information Act. These included: ‘German Flying Wings Designed by Horten Brothers’ by Captain N. LeBlanc, Air Corps, Headquarters Air Materiel Command, Wright Field, Dayton, Ohio, Report No F-5U-1110 NF, dated 5 July 1946. ‘Ten Years Development of the Flying-Wing High Speed Fighter’ by Horten Brothers, Bonn, Flying Wing Seminar, April 14, 1943, Chance Vought Aircraft (Division of United Aircraft Corporation) Report No. GTR 33, dated 18 July 1946. ‘Unconventional Aircraft’ by Colonel R.F. Ennis, GSC Chief, Intelligence Group, Department of the Army, Memorandum No. 7, dated 21

January 1948. ‘The Mystery of the Flying Disks: A Contribution to its Possible Explanation’ by Dr Eduard Ludwig, originally published in *Condor*, a German-language magazine published in Chile; ‘CIA Information Report No SO DB-271/3’, dated 31 July 1950, a US Air Force Memorandum For Record to justify a request for temporary (UFO related) duty for Lt. Col Sterling, Chief, Special Study Group and Dr Possony, Air Intelligence Specialist, CS-15, in Europe for a period of approximately five weeks commencing 15 May 1952; Memorandum number obscured, dated 29 April 1952. ‘Military - Unconventional Aircraft’, CIA Report, number obscured, dated 18 August 1953. ‘Flying Saucers: Theories and Experiments’, CIA Report No. 00-W-30367, dated May 27, 1954. ‘Request for Intelligence Information’, Headquarters Strategic Command, Offutt Air Force Base, Omaha, Nebraska, Reference SAC D/I Control No.417, dated 28 August 1954. Air Intelligence Information Report, ‘Flying Saucers’, prepared by USAF 1st Lieutenant Joseph A. Calhoon, ATI Specialist, Aircraft; Report Number obscured, dated 13 September 1954.

W.A.Harbinson
London, 1991

Revelation

W.A.Harbinson

Without warning, after a night of terrifying disturbance, an event of unparalleled significance occurred to shake the foundations of civilisation.
It was an event so magnificent, so extraordinary, that it would alter forever the political structure and the spiritual beliefs of Western society.
Bringing, ultimately,
the peace that passes all understanding…

‘An extraordinary combination of love story, occult, horror and science fiction… an electrifying read.’
-*Bookbuyer*

‘It’s a great idea and Harbinson makes it work wonderfully. A book with a difference that teases the imagination with its ingenuity.’
-*Sunday Tribune*

‘It has the lot – love, horror, science fiction, political and religious intrigue involving the major religions and world powers, and an extraordinary story of the resurrection of a man hailed by those religions as the saviour of the world.’
-*Bookseller*

All at Sea
on the Ghost Ship

W.A.Harbinson

In the year 2001 the son of bestselling novelist and biographer W.A.Harbinson offered his father a free trip as the sole passenger on a container ship that would sail from Shanghai to Haifa, with many other ports in between. Once on board the ship, Harbinson found that he was the only white face in a crew composed solely of Indian officers and Chinese seamen. He also realised that while he had previously sailed on passenger liners, he was 'all at sea' when it came to a working ship.

All at Sea on the Ghost Ship is Harbinson's account of his unpredictable, always fascinating voyage. Rich in feeling, acute in observation, and often very funny, *All at Sea on the Ghost Ship* is a book to give us hope and make us smile. It is also an intriguing, rare glimpse into the mind of a writer.

The Writing Game

Recollections of an Occasional Bestselling Author

W.A.Harbinson

The Writing Game is an autobiographical account of the life and times of a professional writer who has managed to survive the minefield of publishing for over thirty years.

Unlike most books on the subject, ***The Writing Game*** does not try to tell you how to write, or even how to get published. Instead, it focuses with gimlet-eyed clarity on the ups and downs of a unique, always unpredictable business.

On the one hand, a compelling look at a life lived on the edge, under the constant threat of failure, both artistic and financial, on the other, an unusually frank self-portrait enlivened with colourful snapshots of editors, fellow authors and show business celebrities, ***The Writing Game*** succeeds, as few other books have done, in showing how one professional, uncelebrated writer has managed to stay afloat in the stormy waters of conglomerate publishing.

Here, for the first time, a working author tells it like it really is.

REVELATION
The greatest religious novel of our time
W.A. Harbinson

W.A.Harbinson was born in Belfast, Northern Ireland, in 1941. At nineteen years of age, he emigrated to Australia and enlisted in the Royal Australian Air Force (RAAF), serving in Australia, Thailand and Malaysia. Returning to London six years later, he became the editor of a variety of men's magazines and then began his long career as a freelance writer. His published works include a Number One US bestselling biography, *The Illustrated Elvis* (1975); two bestselling novels, *Genesis* (1980) and *Revelation* (1982); and a British bestseller biography, *Evita: Saint or Sinner* (1996). He is the author of the epic 'Projekt Saucer' series of novels, which remained in print for most of the 1990's. The five novels in the series are: *Inception*, *Phoenix* (nominated for the Arthur C. Clarke Award, 1995), *Genesis*, *Millennium* and *Resurrection*. Harbinson's early Australian novel, *The Running Man* (1967), was turned into a feature film, *The City's Edge*. He has also written for radio and adopted various film scripts into book form. His most recent works are the autobiographical *The Writing Game:Recollections of an Occasional Bestselling Author*, available only through the Internet at www.pabd.com or direct from Amazon; and *All at Sea on the Ghost Ship*, available from www.booksurge.com and Amazon. W.A. Harbinson, when not travelling, which he does a lot, divides his time between an apartment in Paris, France, and a renovated farmhouse in West Cork, Ireland.

Verily, I swear by the day of resurrection; and I swear by the soul which accuseth *itself*: doth man think that we will not gather his bones together? Yea: *we are* able to put together the *smallest* bones of his fingers. But man chooseth to be wicked, *for the time which is* before him. He asketh, When *will* the day of resurrection *be*? But when the sun shall be dazzled, and the moon shall be eclipsed, and the sun and the moon shall be in conjunction; on that day man shall say, Where *is* a place of refuge?
-*The Koran*

With the footprints of the Messiah, insolence will increase and dearth reach its height; the vine will yield its fruit but the wine will be costly. There will be none to offer reproof, and the whole empire will be converted to heresay. The meeting place of the scholars will be laid waste and Golan will be made desolate and the people of the frontier will go about from city to city with none to take pity on them. The wisdom of the scribes will become foolish, and they that shun sin will be despised. The young will insult their elders, and the great will wait upon the insignificant… The face of this generation is as the face of a dog; and a son does not feel ashamed before his father. On whom then can we rely? On our Father who is in heaven.
-*Sanhedrin* 79a (Quoted from *The Messianic Idea in Israel*, J.Klausner)

Woe unto you that desire the
day of the Lord!
Why would you have the day of
the Lord?
It is darkness and not light
As if a man did flee from a lion,
And a bear met him;
And went into a house and leaned
his hand on a wall,
And a serpent bit him.
Shall not the day of the Lord
be darkness, and not light?
Even very dark, and no brightness
in it?

-*Amos* 5: 18-20; also, *Isa*.2: 11

Armageddon (From the Hebrew words *har* = 'mountain' and Megiddo, place name.) The place where all the nations of the world will meet for a final battle, followed by universal peace. Mount Megiddo is in the northern Galilee, not far from Lebanon, Syria, Jerusalem, and the West Bank.
-*The Jewish Almanac*, Richard Siegal and Carl Rheins

PART ONE:

ANNUNCIATION

… and lo, the star, which they saw in the east, went before them, till it came and stood over where the young child was.
-*Matthew*, 2:9

1

The fear limned the edge of the experience and the Whole drew her in. The Whole was a white hole, a burning light expanding, the light spreading out all around her and dissolving the darkness. The fear receded with the darkness. The sun climbed above the mountains. A light of white crosses dominated a breast of earth, and beyond were more hills, a shimmering haze, the desolate plains of the desert.

She knew it was a dream. The light shone on her father's grave. Each mourner added a shovelful of dirt and stepped back with head bowed. She did not bow her head, but instead drew in the burning sun, her dry eyes reflected in the sky where the silence condemned her. Someone chanted the mourner's *Kaddish*. God's greatness was affirmed. 'Beyond all the blessings and hymns…' A voice rising and falling.

She surveyed the distant desert. The fear returned and ebbed again. Her Self viewed the other by the grave, and both were locked in the dream. The rabbi was disenchanted, touching his skullcap with one hand, a mild wind tugging the dark cloth of his suit as he tried not to look at her. No tears. *You won't bend*. Only the rabbi could have made her weep. She ignored his silent reprimand and looked away, surveying the parched, ancient Holy Land.

I do not belong here; I resist and it destroys me. The pain, which was greater than that caused by her father's death, now forced her to rise up and glanced down upon herself on the windswept hill.

I'm a woman; I bleed. All women bleed, the rabbi said. You must accept the bleeding as a sign that life constantly renews itself. *I'm a victim of my body.* You err in thinking so. The body is the temple of your spirit and you chose to defile it. She refused to accept this. The open grave was her truth: her father's corpse in a plain wooden box now buried deep in the soil.

More dirt was shovelled in, the sun flashing off the spades, and the cantor stepped back to make way for the man offering the eulogy. *He was flesh and*

no more. An old man, he is no more. My father, a stranger, a memory: already swallowed by history. Leon's tired eyes examined her. She looked down and surveyed herself. The Valley of Kidron filled her eyes, grassy slopes strewn with rubble, the ghosts of Solomon, Hezekiah and Absalom permeating the air. Leon knew what she was thinking: *I will not give in to this*… Her confusion was greater than her grief and made the pain more unbearable. *I won't bend*, she insisted. That's your dilemma, the rabbi accused. She glanced up and was blinded by the sun and then she fell to her knees.

The Pool of Siloam was filled with water. The brilliant sunlight flashed around Him. He stretched out His hands to the blind man and restored that man's sight. The man called out and wept, kissed the bare feet in the sandals. The wind tugged at the white robes of Christ and made the red water ripple. Then He turned towards her. His radiant eyes filled her with shame. She lowered her gaze and saw the blood spreading across the Pool of Siloam, in which, with a rank, shocking foulness, a foetus was drifting. Someone's child. Her child. The butchered flesh of the unborn. She sobbed and felt a terrible loss as the breath of Christ touched her. Flowing white robes and dark hair. His hands outstretched in beckoning… She sobbed for the loss of her child and then fell at his feet.

-*Blessed child*.

-*God forgive me*.

Her grief made her cry aloud. She opened her eyes and saw the grave. The fear returned and filled her whole being as the ground roared and parted. The dirt fell away, a fierce wind lashed the hill; she dissolved and became a silent scream as the grave opened out. The dark soil was forced aside and the coffin was pushed back up; her father's fingers curled around the splintered edges as white light filled the darkness.

The blinding radiance of His presence. Exultation and terror. The bloody foetus in swirling water, the marble sheen of her father's face, the rabbi with his gentle accusations, Leon's tired, jaded gaze. The confusion increased her terror as the wind roared around her, and she fearfully turned away - from His radiance, His resurrection - as the arms in the white robes in the white light were raised to embrace her.

She cried aloud and awakened.

Kate flipped onto her back, tugging the sheet from her naked body, opening her eyes and glancing wildly about her, gasping harshly, heart pounding. Silence. Something else… The silent screaming of the dream… She saw the white walls of the bedroom, the window open, the curtains fluttering, a light breeze chilling the sweat on the tanned skin of her trembling limbs. She lay there, shaking helplessly, a child again, desolated, visions of blood and death in her head as her pounding heart settled.

'Damn,' she muttered, rubbing her face with the sweaty palm of her hand, 'I should never sleep alone.'

She sat up, wrapped her arms around her raised knees, and studied the quiet, dark room. White walls, a few paintings, some framed diplomas, scattered clothes, functional furniture and numerous books on psychology; little else of real value. She glanced about her and shivered. The night's silence was unreal. The phantasmagoria of the dream was still with her, cobwebbing her thoughts.

Her father's room was next door, but he had died a week ago. She recalled him lying in his bed, his body cold, his face white, an unrecognisable, alabaster mask, his fingertips pressed on his sightless eyes. Death: the inevitable. Death: the unforgettable. Kate shivered and removed her arms from her knees and then stretched her long legs. *Physician, heal thyself.* Kate tried to ignore the thought. She took a cigarette from the bedside cabinet, lit it and inhaled; then, with a sigh, her body cool, swung her legs off the bed.

The darkness was not comforting, the silence was oddly threatening, and bewildered that the fear should still be present, she stood up and stretched herself. Naked, she was alive, her flesh releasing her from her mind. A cool breeze came through the window, touched her skin and made her yearn for oblivion. Not mere pleasure - oblivion - the ephemeral drowning in sensuality. She thought about sex, about blood, the dream's foetus; and the fear, which for a brief moment had left, now returned to take hold of her.

'Damn it,' she murmured, 'I'm *still* dreaming.'

The words were no comfort, sounding ethereal in the empty room, echoing in the depths of her head as if spoken by someone else. She shivered again, inhaling deeply on her cigarette, her dishevelled hair caressing her shoulders and the blade of her spine. The fear was insidious and could not be explained; in trying to explain it, she returned to the dream and that merely

increased the fear.

Silence. Shifting shadows. A faint light fell through the window. Out there, beyond the window, was the night and its dark, treacherous deserts. Kate stared at the window. The light seemed to be calling to her. Shivering, she took a step forward, then stopped again, feeling nervous. *What is it?* (It is nothing.) She inhaled on her cigarette. Her body felt light, incorporeal, floating somewhere beneath her. The fear was irrational, yet her business was rationality; thinking this, she was touched by a shame that impelled her to move again. She let the smoke out slowly, ran her fingers through her hair, took a deep breath, then walked to the window and pulled the curtain aside.

She saw the star immediately, unusually large, too bright, dominating the glittering mosaic all around it with a pulsating brilliance.

A star. What star? She had never seen it before. Unfamiliar with astronomy, she nevertheless knew the sky and was convinced that that star should not have been there. She blinked and looked again, but the star remained there, pulsating yet unreal.

She saw little else. Her gaze was fixed on the heavens. The large star was at the vortex of an immense web of smaller stars and black sky, the pale moon wreathed in thin clouds, streaks of dark blue around it: the great tapestry of the cosmos, infinite, impenetrable, stretching over the sleeping hills and plains, the night's conspiracy of silence. Kate was drawn to that star; it drew her in and then dissolved her. She blinked, shook her head, looked again and saw its hard, glittering brilliance.

'This is stupid,' she whispered. 'You're being foolish. It's just a damned star.'

Her voice sounded strange, disembodied and unreal, lingering like an echo in her mind, before fading away. This, also, was disturbing, heightening her fear, forcing her thoughts back to the dream and its condemnations.

'A *star*?' she said softly.

She couldn't understand it: the star should not have been there. It was large and pulsating and unnaturally bright, dominating the glittering sky. That same sky had coloured her dream, that same moon had shone down; the pool of blood and the drifting foetus had been drawn from her past, but the star, which she had never seen before, had no place in her history. Kate inhaled on her cigarette, blew the smoke out and shivered, her lean body framed by the window and licked by the breeze. She kept staring at the star, shaking her

head in bewilderment, trying to accept that she was actually awake, feeling more like a sleepwalker.

'Five o'clock in the morning,' she said ruefully. 'I'm still drunk… or still dreaming.'

Still dreaming of nameless fears, of a past that refused to die, of the physician who could not heal herself and instead let her work rule her life. She did not belong here. This land was not her land. No longer young, now alone in an impassioned, divided country, she, who viewed passion as an irrational impulse, passed her days in a desperate fight against despair and could not sleep at nights. Also, her dreams were haunting, coloured with guilt and confusion, the contradictions of the spirit and flesh resurrecting her lost hopes. A child in a woman's body, a frightened being with a sharp, defensive tongue, a physician who healed damaged minds but could not soothe her own fears.

Kate Hirschfield was naked. Her eyes reflected an unknown star. She looked up, unable to believe what she was seeing, wishing that daybreak would come.

'Go away, damn you! *Go!*'

A star. *What star?* It did not belong there. It was far bigger than the surrounding stars, and seemed closer, more vibrant. Kate inhaled on her cigarette, exhaled slowly, licked her dry lips, hung-over, half asleep and confused, the fear slipping into her. She shivered and shook her head, trying to break free from the dream, thinking of Leon and the rabbi and her father's death, feeling obscurely defenceless. She had drunk too much last night and was drinking too much in general; between Leon and her own sense of desolation, she was losing touch with herself. *Physician, heal thyself*. Kate tried to smile, but didn't make it. She stared up at the star, wondering what it could be; and then, despising her rising fear, turned away from the window.

'I need sex,' she said.

She walked back to the bed, sat down and crossed her legs, stubbed her cigarette out in the ashtray and then reached for the telephone. Her hand wavered in the air, a pale web in the darkness, fingers outspread and curving down slightly, hesitating, retreating… No, not this time… not at five in the morning. She shook her head wearily, crossed her hands to hold her shoulders, rocked her body languidly from side to side and then lay down on the bed.

‘He’s dead,’ she said. ‘My father is dead. I’m thirty-five years old.’

The confession was no comfort and did not dispel the fear that continued to coldly drape itself over her. She tried to rationalise the feeling, putting it down to the dream, but her eyes, roaming restlessly around the silent, moonlit room, were drawn inexorably back to the window and the darkness beyond. Kate felt disorientated. She couldn’t shuck the dream off. Now, blending in with the pervasive images of the dream, was the image of a large, brilliant star that should not have been there.

‘Kate Hirschfield,’ she said aloud, ‘you’re imagining things…or you simply never *noticed* that star before.’

The silence mocked her words. Though shivering with cold, she was sweating. She wanted someone beside her, on top of her, inside her, obliterating the fevers of the night and the fear clinging to her. What was making her fearful? Why did the silence chill her? Kate closed her eyes and touched her trembling body to confirm her own presence. She touched her breasts and nipples, ran her fingers over her stomach, slid both hands along her smooth thighs, felt inside, then gasped helplessly. She kept her eyes closed and explored herself, drifting out towards freedom.

Darkness and silence. She surrendered to sensation. The prison of her body vaporised and left her adrift. Her eyes were still closed. The moon and stars filled the void… Leon running his tongue slowly down her neck and filling his mouth with her breast. Last night, about midnight. Then more drinks and a taxi home. Not kosher, but good for sleepless nights before the dreams resurrected her… The dark, upturned soil, her father’s grave washed in white haze; the cantor and the rabbi and Leon, the murmured grief of the mourners. Fierce heat. Dazzling light. The sun climbing in the sky. Darkness falling with abrupt, startling speed to bring with it the moon and stars… The stars. *What stars?* That large star should not have been there. What sky is it? Where am I? I am here, in my bedroom. But that star was unnaturally large and too bright to be real… She looked up and the fear returned. The star expanded - in the sky or in her mind - and became a blinding light that spread out to engulf her.

Kate gasped with shock, heard the rumbling, felt the shaking, saw her paintings swinging crazily on the walls as the light filled the room. The fear shook her awake, but she didn’t know what was happening; the rumbling was a muffled sound all around her, outside and inside. The room continued

shaking, ornaments rattling, the paintings swinging, and Kate groaned and rolled onto her hip and grabbed the side of the bed. Then she blinked, disbelieving, taking in the dazzling light, crying out as her whole body shook and panic whipped through her.

The room was brilliantly illuminated, the floors were shaking and rumbling. The fierce white light was pouring in through the window and turning the night into day. Kate couldn't believe her senses. She heard the low, muffled rumbling. The room shook even worse than before and then the bright light transfixed her.

'Oh, my God! What - ?'

The muffled rumbling continued, cups and saucers were rattling, and then the brilliant light started flickering on and off with dazzling rapidity. Kate gasped and gripped the bed, felt it shaking beneath her, fixed her eyes on the paintings on the walls as they swung to and fro. The light and darkness formed a jigsaw of brilliant chiaroscuro, the stark black and white creating bizarre shapes, which were constantly changing. Kate opened her mouth to scream, felt the breath drawn from her lungs, choked and somehow managed a groan and then rolled onto her stomach, her face turned to the side.

'No more!' she whispered. '*No more!*'

The room was plunged back into darkness, the harsh rumbling faded away, and Kate lay there, too frightened to move, as the bed stopped its shaking. Silence. And darkness. She couldn't believe what had happened. Her heart was pounding and she felt very cold and yet her sweat stained the bed sheet. She licked her parched lips and let her racing heart slow down. The paintings on the walls had stopped swinging and the silence was absolute.

Kate lay there for some time, covering her face with her hands, too weak, perhaps too frightened to move, wondering what had occurred.

Perhaps it had been an earthquake. What else could it have been? Yet an earthquake would not explain the light that had poured in through the window. Kate lay there, still trembling; closed her eyes and saw the star… then retreating from the edge of the impossible, she opened her eyes again.

A dream. Or not a dream. An experience of the night. The fear limned the edge of the experience and would not let her go. She took a deep breath, let it out slowly, sighed and then licked her dry lips and rolled onto her back. She stared carefully around the room, feeling bewildered and paralysed, noting

that nothing had changed, but not feeling relieved.

She could not get off the bed. Her eyes were fixed on the open window. Still naked, she lay there on her back and wondered what was outside. She breathed deeply and evenly, closed her eyes and then opened them, looked up, hardly knowing the time or where she was, and saw the window framing only a crimson light which bled weakly from darkness.

Eventually, she stood up, feeling weak, her skin cold, and stepped forward as if in a trance and then stopped at the window. Shivering, she pressed against it, her flat stomach touching wood. She felt her body, the naked skin, the hard nipples, reaching out to the cold air. Where was she? She wasn't sure. What had happened? The inexplicable. And so fearful, hypnotised, a child startled by the unknown, she leaned against the window-frame, licked her lips, took a deep breath, and then, not too sure of what she would see out there, glanced up at the bloody sky, heaved a sigh of relief, then looked down at the golden domes and spangled minarets as they emerged from the quietly retreating darkness and took shape in the crimson haze.

Dawnlight.

Over Jerusalem.

2

Major-General Moshe Eitan, Chief of Staff of the Israeli Armed Forces, marched into the VIP lounge of Ben Gurion International Airport, twelve miles from Tel Aviv, just as the self-propelled passenger steps came to rest against the side of the El Al 747 beyond the light-reflecting, bullet-proof, plate-glass windows. Lieutenant Paul Frankel, standing in front of the windows, nodded at the soldiers outside, watched them march in two well-armed lines towards the parked aircraft, and then turned around and stepped forward to greet his superior officer.

'He's arrived?' Major-General Eitan said brusquely.

'Yes, sir. He's just about to disembark. I've placed men all around the airport terminal, at every entrance and exit.'

'Any more phone calls?'

'No, sir.'

'Very good. They're clever bastards, as always.'

Standing in front of the slim, neat, delicately handsome Lieutenant Frankel, Major-General Moshe Eitan looked even larger and more dishevelled than he actually was, his weather-beaten face, with its lined skin, broken nose and gelid eyes, a parchment of singularly harsh experiences, made even more intimidating by its finely controlled tension and by the body, all muscle and bone, that strained against a tight uniform. Now Moshe stepped forward, running his fingers through his tangled brown hair, and stopped when he reached the plate-glass window, placing his hand on his pistol.

'Any more information about this morning's earth tremor?'

'I'm afraid not. It was totally inexplicable. There would normally be signs of its coming, but in this case there weren't. So far we can't explain it at all.'

'I really can't accept that.'

'Nor can our geologists. They were still debating the matter when I left them – almost tearing their hair out.'

‘They were probably just upset at being pulled out of their damned beds.’

‘I don’t think so, sir. On the contrary, they seemed excited. There was no prior indication of such an earth tremor, so it has them intrigued.’

‘Sweet of voice, but short of brains,’ Moshe quoted. ‘Still,’ he added, ‘I thought it was some kind of huge explosion.’

‘So did I, sir. But it wasn’t. It’s an absolute mystery.’

‘Both mysteries,’ Moshe replied. ‘The earth tremor and the phone call. This is shaping up as a potentially bad day.’

With his fingers still pressed to the plate-glass of the window, Moshe glanced around the empty lounge, automatically searching for something amiss. Seeing nothing, he was nonetheless still worried. The telephone call had been made directly to the Air Traffic Controller at four-thirty that same morning, the unknown caller stating that there would be an attempt on the Prime Minister’s life when he disembarked at Ben Gurion Airport. The ATC had immediately notified airport security, and the message, relayed to Moshe through Shin Bet, had forced him to leave his bed and organise the temporary closing and thorough searching of the whole airport terminal. Neither a bomb nor a would-be assassin had been uncovered and, although it now seemed that the call had merely been one of harassment, Moshe still had good reason to be anxious.

‘You’re sure you’ve checked everything?’ he said to Lieutenant Frankel, without looking over his shoulder.

‘Everything,’ Frankel replied, rather testily. ‘We’ve turned the place upside down.’

‘And the call was untraceable?’

‘We only know that it came from the Jaffo area. It was too brief to be traced.’

‘Damn them,’ Moshe said.

Lieutenant Frankel walked up to beside Moshe and they both stared through the plate-glass windows as the soldiers fanned out around the aircraft. It was just after dawn and the sky beyond the plane was a cloudless, dazzling crimson, streaked here and there with yellow sunlight and silvery striations. The rear passenger door of the aircraft had been opened and two men wearing IDF uniforms emerged to take up positions at either side of the doorway, their eyes scanning the highest points of the terminal building and the shadowed ground of the apron area. The special task force, commanded

by two veterans of the last Israeli-Palestinian war, had now formed a protective triangle around the passenger steps. At the top of the steps one of the two uniformed men, obviously satisfied with the security arrangements, turned to glance back into the plane and then nodded his head.

'What a way to arrive home,' Moshe said quietly. 'Will we ever know peace?'

'I doubt it,' Lieutenant Frankel replied. 'It's getting worse every year. We'll only know peace when either the Jews or the Arabs are obliterated.'

'Hopefully the Arabs, lieutenant?'

'Naturally, Major-General.'

'Ah, yes… naturally.' Moshe offered the words with barely muted sarcasm, his voice quietly cutting. He glanced at the lieutenant, noting the blush on his cheeks, then grinned slightly, mockingly, before turning away to focus his cool grey eyes on the airstrip. 'There he is,' he said, nodding.

The Israeli Prime Minister, wearing only a pair of rumpled grey slacks and a white, open-necked shirt, with his jacket draped informally over one arm, had emerged from the interior of the plane and was carefully making his way down the steep passenger steps to the tarmac. When he reached the bottom, the soldiers of the special task force closed in around him, and then, when the Prime Minister had shaken hands with his personal secretary, the whole group started towards the terminal building.

The sun was rising behind the aircraft, an enormous, incandescent globe, yellow blending into gold, its shape distorted in the shimmering air, spreading out through the haze like a stream of molten iron, the surrounding sky streaked with blue and crimson, setting the few clouds on fire. On the tarmac, the soldiers were colourless, holding their rifles at the ready, their shadows stretching grotesquely in front of them, elongated and jittery. The Prime Minister was walking casually, glancing around at the heavy guard detail, mopping the sweat on his balding head with a handkerchief, a small man, deceptively insignificant, almost lost in the larger group.

'He looks tired,' Lieutenant Frankel said.

Moshe didn't reply. He merely stood where he was, leaning forward, fingers outspread on the glass, his head turned to the right, his cool eyes following the Prime Minister as he reached the door of the VIP lounge and disappeared into the corridor at the other side of the wall. The soldiers, forming a protective path stretching from both sides of the door, snapped to

attention and then performed an about-face, while Moshe, sighing profoundly, running his fingers through his hair, turned back to face the lounge, his body silhouetted in the exotic crimson dawn that was framed by the windows.

'So far, so good,' he said quietly.

The Prime Minister, followed by his immaculately suited male secretary, came into the lounge, blinked, rubbed his eyes, then looked up at Moshe and Lieutenant Frankel, offering a weary smile. 'I'm too old for all this travelling,' he said. 'I could sleep for a month.' The two soldiers in charge of the task force entered behind him, closed the door after them, then stood close to the urbane, grey-haired secretary, their Uzi sub-machineguns slung over their shoulders. Moshe nodded at both of them, offered a flickering smile, then returned his attention to the Prime Minster.

'So,' the Prime Minister said. 'Do we, or do we not, get to meet the famed Rashid Idriss?'

'Yes, Shlomo, we do. He's having breakfast in one of your offices in the Knesset right this minute.'

'I don't believe this,' the Prime Minister said, shaking his balding head from side to side, a bemused smile on his face. 'The dreaded PLO leader is right there in the Knesset. It's ridiculous… Impossible.'

Moshe grinned laconically, though the humour didn't quite reach his grey eyes. 'Well, he's there alright. He arrived just before I left. He's being entertained by the under-secretary - and he's breathless to talk to you.'

'If word of this leaked out, we'd *all* be in trouble.'

'The word won't leak out, Shlomo. We've only informed Mossad and Shin Bet. And Rashid is in the same boat as us: what would *his* people think if they knew he'd actually stepped foot in the Knesset?'

The Prime Minister nodded, scratched his nose and glanced around him. 'So, Moshe, how did you get him here?'

Moshe smiled, tilting his head to the right in a kind of salute, his eyes fixed on his old friend. The Prime Minister was a small, rather stocky figure whose sixty-three-year-old face still retained a deceptively childish innocence, his hazel eyes a bit too large, displaying constant surprise, his face finely boned and moon-shaped, his smile displaying the openness of a peasant. More than one man had made the mistake of judging Shlomo Ben Eleizer by that seemingly immature countenance, not realising that behind the

carefully cultivated peasant's simplicity lay a life of harsh military experience and cunning, often ruthless, political intrigues. What made Moshe smile, as he stared obliquely at his old friend, was the knowledge that he, too, even knowing what he knew, had fallen, more than once, for the Prime Minister's quietly theatrical air of naivety.

'He travelled incognito from Cairo to Suez,' Moshe said, 'took a boat across the Suez Canal to El Shatt, was met there by one of our men and flown to the airstrip at Hakira, then driven from there, in an escorted convoy, direct to the Knesset, arriving about an hour ago and being slipped in through a side door that was guarded by select members of Shin Bet. So, very few on either side know that he's here… Lieutenant Frankel arranged it.'

'Very good, lieutenant,' Ben Eleizer said. 'I am reassured.'

Understanding that the compliment was automatic rather than heartfelt, Lieutenant Frankel nevertheless blushed with muted pleasure and stroked the moustache on his dark, delicate face with a pianist's long fingers. Moshe noticed the gesture, sensed the lieutenant's suppressed nervousness, smiled slightly, then turned his head away to gaze out at the rising sun.

'So, Prime Minister, shall we go?'

'Yes, Moshe, let's do that.'

At a curt nod from Moshe, the two army officers removed their Uzi sub-machineguns from their shoulders, held them at the ready, and led the whole group out of the VIP lounge, down a private corridor that bypassed Customs, and out into an underground garage. Construction of the corridor and special diplomat's garage had been completed four months ago, after some PLO gunmen had, remarkably, managed to get into the airport terminal and attempted the assassination of the Prime Minister; now, the enormous garage, with its walls of thick concrete and electronically controlled doors, had the appearance of some ghastly, futuristic bomb shelter, the air cold, footsteps echoing. Moshe, who did not like enclosed spaces and was, also, now reminded of this morning's mysterious telephone call about another possible assassination attempt, was glad when they were all seated in the armour-plated limousine and it was bouncing over the top of the ramp onto the road that would lead them eventually to Jerusalem. The sun, now much higher in the sky, was filling the air with a pearly grey light.

'And how was New York, Shlomo?'

'Need you ask, Moshe? You've obviously read about my lamentable *faux*

pas - it's already sold lots of newspapers.'

Moshe grinned, withdrew a cigarette from his tunic pocket, held it up to the Prime Minister and received a nod of consent. 'Yes,' he said, lighting the cigarette with the lighter in the rear of the front seats. 'Whatever possessed you, Shlomo?'

The Prime Minister groaned histrionically, then put his head back and rubbed his eyes with his fingers. 'I shudder to think about it. I just stupidly lost my temper. We're not popular with the United Nations and I think it just finally got to me… But what a thing to say… so *stupid*… I behaved like a *klutz*.'

'Not like you,' Moshe said.

'No, Moshe, not like me.' The Prime Minister removed his hands from his head, looked up and shrugged, smiling sardonically. 'Well, you know what the General Assembly is like: sanctimonious morality and mock outrage… So, the Russian delegate was assuring the Assembly that so long as Israel continued to pursue her expansionist policies, they, the Soviets, would continue to supply arms to the United Arab Republic - and at that, very foolishly, I found myself proclaiming that should the need arise we would be prepared to use our atomic weapons… Well, you can imagine… Before I even crawled into my bed that night, my outburst had been eagerly seized upon and broadcast around the world as - '

'Israel's own Final Solution.'

'Please, Moshe, don't remind me.' The Prime Minister offered a rabbinical groan of despair, covering his lowered face with his hands and then removing them to glance wearily around him. He and Moshe were side by side in the rear seats facing the front of the limousine; Lieutenant Frankel, neat and handsome, nervously stroking his thin moustache, was sitting opposite, his back to the driver, his dark eyes fixed on them both. Up front, beside the driver, was a commando with an Uzi sub-machinegun; and two trucks filled with armed soldiers, out in front of the limousine, the other behind it, were churning up clouds of dust that were blotting out the exotic brilliance of the sunrise over the hills and plains around Ramla.

'Why not?' Lieutenant Frankel said, his dark eyes flashing with barely suppressed anger. 'Use our atomic weapons and put an end to it. Let the world complain later.'

Moshe glanced at the Prime Minister, saw a hint of amusement, then

turned his cool gaze on the young lieutenant.

'I admire your enthusiasm,' he said quietly. 'What you lack is discretion.'

The lieutenant blushed, looked down at his feet, then nervously stroked his moustache with his index finger. Twenty-eight years old, an Orthodox Jew, graduate of the National Defence Academy, Frankel was a relatively inexperienced but highly promising member of Shin Bet, the security service responsible for internal security and counterintelligence within Israel. Moshe also knew that Frankel was a fanatical Zionist who saw in the present government and its leading members the possible weakening of true Zionist ideals in the face of increasingly antagonistic world-wide opinion. Now, obliquely studying the young man, taking note of his embarrassment and suppressed anger, Moshe knew that he was secretly yearning for the time when the new generation, his generation of sabres, would sweep away the old regime and guide the Jews of Israel to what he imagined was their manifest destiny. Such feelings, which were understandable to Moshe, also filled him with dread, because such feelings, though rooted in a passion for Israel, left no room for compromise.

'Why all the guards?' the Prime Minister asked.

'We had another anonymous phone call.'

'A threat?'

'Yes. In the event, it appears it was simply harassment.'

'Arabs?'

'No, Shlomo.' Moshe took a deep breath. 'We think it was Jews.'

An uncomfortable silence followed Moshe's remark, causing them all to stare through the windows of the speeding limousine and dwell on the implications of what they had heard. The land here was flat, no longer green, parched by the sun; and as they passed the wrecked tanks and trucks, left there as monuments to the war of 1967, the irony of the scene was not lost on them. Moshe sighed and inhaled on his cigarette, feeling terribly weary.

'I find it hard to accept that it was Jews, Moshe.'

'I *refuse* to accept it,' Lieutenant Frankel said.

Moshe pursed his lips, exhaled the cigarette smoke, watched it drifting lazily in front of him and then rubbed his tired eyes.

'Our young lieutenant is shocked,' he said quietly, 'but unfortunately the facts speak for themselves.'

'What facts, Moshe?'

‘Four months ago, Shlomo, two PLO assassins managed to get into the airport and hide themselves there all night. How they managed to do it, we never found out, but we know that they couldn’t have done it without the assistance of Jews. An anonymous phone call put paid to the attempted assassination, but since the caller obviously knew exactly where the assassins were hiding, we can only assume that he was involved in getting them in there, but wanted to scare us rather than actually kill you.’

‘So, he was Jewish.’

‘Correct.’

‘And this morning?’

‘Obviously a similar case - both harassment and a warning. However, the anonymous phone call was made directly to the Air Traffic Controller, and that number, as you know, is classified. So it had to be someone who knew the airport, which means he was Jewish.’

An uncomfortable silence prevailed as the western outskirts of the Golden City came into view. The Prime Minister pursed his lips, Lieutenant Frankel stared at his own feet, and Moshe studied them both with his grey eyes concealing his thoughts… Jew against Jew. An unprecedented situation… Moshe felt a spasm of grief and outrage, an anguished incomprehension. What did Lieutenant Frankel know? His innocent world was not their world. Neither Orthodox Jews nor fanatical believers in Zion, Moshe and the Prime Minister were embroiled in international diplomacy and now had to accept that Israel was merely part of it. Lieutenant Frankel saw it differently, with young eyes, insular eyes, his view more emotional than realistic, rooted firmly in a devout, unyielding Judaism. Doubtless he had felt revulsion at bringing Rashid Idriss into Israel, had secretly felt like a traitor during every mile of the journey, convinced only that he was protecting an Arab murderer, a PLO leader. Moshe knew what he was thinking and could understand his suppressed anger: what was Israel coming to that she could stoop to negotiating with terrorists? That she could vacillate about the West Bank to the point where Jew was ready to kill Jew for it? Yes, Moshe understood - he shared the younger man’s frustration - but he also realised, with the heavy heart of an older man, that compromise, that very bitter potion, could not be avoided.

‘So, Moshe,’ the Prime Minister said eventually, ‘what do you think Rashid Idriss wants?’

‘What he’s *always* wanted,’ Lieutenant Frankel said, his bitterness obvious. ‘Some form of surrender.’

‘Hardly the correct word,’ Moshe admonished him.

‘It’s the *only* word,’ Lieutenant Frankel said.

The Prime Minister sighed, waving his hands to silence them both, then leaned his head back against the seat, suddenly looking his age. ‘We’re not in a good position, gentlemen. We’re out of favour in the West, the Arab Republic is almost united, and now the Netorei Karta zealots and the fanatics of *Gush Emunin* are turning the West Bank into a fortress and dividing the country, Jew against Jew… No, gentlemen, not a very good position. In fact, it’s never been worse.’

Moshe cupped his large hands, lowered his face to them, wiped the sweat off, then removed his hands and glanced outside the limousine, displaying his secret despair.

‘Jew against Jew,’ he said, whispering. ‘Who would ever have thought…?’

He didn’t complete the sentence, but instead stared at Lieutenant Frankel, the veil dropping back over his eyes, leaving them cool and unreadable. Lieutenant Frankel licked his lips, stroked his moustache with a nervous finger, then lowered his gaze and studied his own feet as if disowning the issue. Moshe smiled, without happiness, feeling weary and haunted, trying to steel himself for the meeting to come, and dreading what it might lead to.

The driver turned off the road, moving past wide green lawns that offered a panoramic view of the hills and valleys of Judea, sun-scorched and magnificent, before heading through dense trees and emerging in front of the Knesset, Israel’s Parliament House, while Moshe stared at the young lieutenant and the ageing Prime Minister, their eyes meeting for a brief, embarrassed moment, trying to express the unspeakable.

Five minutes later, in the Prime Minister’s office, they were informed that a bomb had exploded in Jerusalem.

3

The bomb had exploded at seven o'clock in the morning, destroying a synagogue and three houses in one of the densely populated streets of the Mae Shearim quarter. Thirty minutes after the explosion Kate Hirschfield was leaning against a wall in the Hadassah Medical Centre, looking on as the wounded and their shocked relatives and friends were brought into the reception area. The victims were all members of the unpopular Netorei Karta sect, the men wearing frock coats and dusty wide-brimmed hats, the women dressed in equally sombre clothes, looking shabby and archaic. The women wailed and wrung their hands, the men were dazed or murmuring prayers, and the medics, carrying the wounded in on stretchers, had to push them aside. '*Gevalt*!' someone cried. '*Gottenyu*, all the blood!' The blood was bright on the wounded on the stretchers and stained the clothes of those walking. The reception hall was in chaos, the weeping and wailing making it worse; the medics in their smocks were pushing through with the stretchers while the walking wounded or those simply shocked stared around in confusion.

'How many were hurt?' Kate asked.

'Nine,' the harassed doctor replied. 'Four are dead and five are badly wounded. The rest are shocked. Some are deaf.'

'Who planted the bomb?'

'We don't know yet, Kate. Either Arabs or fanatical Zionists… The Netorei Karta aren't popular.'

Still shaken by her dream and the bizarre events of the early morning, Kate stepped forward and waved her hand at Nurse Jabotinsky. The patients on the stretchers were disappearing, but the other zealots remained, the women shaking and sobbing, the men groaning or murmuring prayers, eyes dark, cheeks hollow, beards grey and long, their frock-coats covered in dust from the explosion, their wide-brimmed hats askew.

‘Let’s sort them out,’ Kate said. ‘Some are probably just dazed. I only want the really bad cases; we haven’t beds for the others.’

Nurse Jabotinsky nodded vigorously, her brown eyes big and bright, her worker’s hands pressing the heavy thighs of her short, fleshy body. ‘Terrible!’ she exclaimed dramatically. ‘What a terrible thing to do! For *this* we come to live in *Aretz*! We should all be committed!’ She stepped towards the milling zealots, her face flushed, her lips firm, while Kate, feeling exhausted and fearful, pushed herself away from the wall.

Another stretcher was carried in, the victim strapped down and groaning, both legs a ghastly mess of exposed bone and blood, plasma jars swinging above his head, a medic holding the rubber tubes high. ‘Make way! Let us through!’ Kate stepped aside to let them pass. A woman stared at the stretcher, her eyes widening, glazed with horror, then she shrieked and staggered forward, one hand outstretched, trying to reach for the wounded man. Kate quickly grabbed her wrist, jerked her back, snapped in her ear, and the woman, shuddering with shock, turned away and covered her face with her hands. The stretcher was rushed away, the medics shouting at one another, and Kate walked up to the side of Nurse Jabotinsky and stared intensely around her.

The women were still wailing, wiping the tears from their eyes, burying their faces in handkerchiefs and scarves, holding on to each other. The men were less demonstrative, if just as shocked or outraged, some licking their lips or covering their faces, others kissing their prayer books. ‘Beasts!’ someone exclaimed. ‘Who would do such a thing?’ Kate reached out to the speaker, an old man, his eyes dazed, placed her hand on his shoulder and shook him gently, whispering soothing inanities.

‘It’s all right,’ she said. ‘Quiet now.’

Blood, she was thinking. This whole country is drenched in blood. I live in a country that’s been built with blood and death; I dream about my own draining blood, about the deaths of the young and old. She looked at the man before her, a religious fanatic, an anachronism, the wide brim of his hat shading eyes that were glistening with tears. One of the Netorei Karta zealots, the guardians of the gate, an old man now resembling a child, his tears staining his cheeks. Kate felt sorry for him. She wanted to despise him, but couldn’t. Instead, she felt the sort of despair that twists down into bitterness.

This land was not her land, these people not her people. They lived with a

dream that had its roots in the past and was strangling in the thorns of its contradictions. Kate wanted no part of it. This impassioned land turned her cold. Her father dead, she was now on her own, and she wanted to leave.

'Medics!' she snapped suddenly, waving her right hand in the air. 'Get your hands out of your pockets and let's do some work. Over here, you *luftmenshes*!' The medics jumped to attention, their indecision swept away, galvanised into awareness by the familiar sound of Kate's commanding voice. 'Take these men to my clinic. Put those two women and that man in beds, the others into my waiting room. You understand? *Immediately*!' The medics did as they were told, moving amongst the dazed survivors, taking hold of the men and women, speaking reassuringly to them as they led them away.

'Go with them,' Kate said to the man standing directly in front of her.

The old Jew didn't move, towering over her, looking down at her, his eyes gleaming from the shadow of the wide brim of his hat, the tears rolling out of that shadow and draining into his grey beard. 'A bomb,' he said quietly, his voice cracked and dry, emerging from the depths of his dazed incomprehension like the sound of the wind across barbed wire. 'Why us? We are nothing…' Kate murmured soothing words, but the man's gaze remained fixed, weeping eyes focused inward on a past that ran back to the Holocaust. An obsessed visionary, a religious zealot, an anachronism, he would watch the world go down in smoke and flames before renouncing his faith.

Kate could not share such faith and did not believe in resurrection. She believed in the reality of flesh and bone, dust to dust, no returning. Yet staring up at the old man, she recalled her recurrent dream, the strange, unknown star, the light pouring in from the rumbling darkness as the bedroom shook wildly. The recollection was a challenge, making her question her own beliefs, now wondering, with the sort of chill that springs from inchoate panic, if the bizarre event had actually occurred, and, if so, what the dream and the extraordinary event had represented.

' - sorted out,' Nurse Jabotinsky was saying. 'We'll have to sedate the bad cases. I don't know about the others in your clinic, but no doubt you'll find out soon enough.'

Kate tried to focus her thoughts, wondering what was happening to her, gradually forcing herself back to the reality of the more brutal present. The

departing women were still wailing, their men folk chanting prayers, the medics ushering them away with professional hands and whispered words that meant nothing. Kate started to follow them, but someone called her name. She turned around to face Lieutenant Paul Frankel as he stopped in front of her.

'Filthy bastards!' the lieutenant said. 'Someone buys a loaf of bread from a shop and leaves a bomb by the door. What the hell are they trying to prove?' The lieutenant's handsome face was grim, his eyes luminous with rage, and he stroked his thin moustache with a finger, beads of sweat on his dark skin. He glanced briefly at the old Jew, who still stood in front of Kate, then looked back at Kate, shook his head and shrugged his shoulders despairingly. 'His son was killed,' he said, obviously referring to the old man. 'At least three buildings were demolished. A few others are moderately damaged and the fire is still burning. Filthy bastards! Why there?'

Kate looked around as a medic approached, a young man, an Arab, moving over to place his hand on the old Jew's shoulder, carefully keeping his gaze lowered. Lieutenant Frankel stared at him with hatred, obviously thinking of the bombing, and Kate, taking note of the light in the lieutenant's eyes, offered the Arab a friendly nod.

'It might have been Zionists,' she said. 'They have fanatics as well. The Netorei Karta zealots are against the Zionist State, and a few of them *have* been murdered because of that.'

'There's no proof that it was Zionists,' Lieutenant Frankel replied coldly. 'And you, Dr. Hirschfield, particularly given your standing here, should not be listening to subversive tales from the bazaars.'

Kate smiled and stepped back, letting the Arab reach the old Jew, looking on thoughtfully as he shook the old man gently and said, 'Please, sir, come with me.' The old Jew didn't move, but continued to stare straight ahead, his tearful gaze fixed directly on Kate without really seeing her. 'A bomb,' he said. 'Why?' He had stopped weeping, but his cheeks were wet. 'Please, sir,' the medic said quietly. 'This way… Come with me.' Lieutenant Frankel stared coldly at the Arab medic and then returned his gaze to Kate. 'I don't think the old man can hear; the explosion probably deafened him.' The Arab led the Jew away, looking very small beside him. Glancing down, Kate saw blood on the floor where it had dripped from the stretchers.

'I think you're an Arab sympathiser,' Lieutenant Frankel said stiffly.

‘No,’ Kate replied, ‘I’m not. I’m just sick to death of this damned country and its unreasonable hatreds.’

She turned and walked away, brushing the hair back from her eyes, feeling weary, confused and slightly feverish, the night’s fears still pursuing her. Nurse Jabotinsky hurried up to join her, saying, ‘A rude one, that lieutenant.’ They walked side by side along the corridor, following the Jew and the Arab.

‘He’s alright,’ Kate said. ‘He’s just a bit upset. It always hits them harder when they’re young… Was that an earthquake last night?’

‘Something like it,’ Nurse Jabotinsky replied. ‘It shook most of Jerusalem. At first, I thought it was an explosion - a big explosion, far away - but it went on too long to be that, and our whole street was woken up. Some sort of earth tremor that didn’t do any damage, so we all went back to bed and said our prayers.’

Kate was slightly relieved, but the feeling of foreboding remained with her, the memory of the unknown star and the frightening bright light keeping her in a state of nervous tension. They passed one of the emergency wards, glanced in, saw blood and bone, moved on to the psychiatric wing where Kate’s patients were waiting. *Physician, heal thyself…* Kate found herself shivering. A sharp banging sound accompanied swinging doors as a stretcher was pushed out of an operating theatre. Someone groaned, a medic cursed, light flashed off a plasma jar, rubber tubes swinging above the blood-soaked patient, the trolley’s wheels making squeaking sounds.

‘Did you see anything?’ Kate asked, unable to let the matter rest. ‘I mean, when you looked out after the earth tremor. Did you see anything strange?’

‘Strange, Kate? No. A lot of my neighbours in their pyjamas, I saw, all looking as though Judgement Day had come, none wildly attractive.’

Kate had to smile at that, but her good humour was fleeting, swept away on another tide of disbelief when she thought of that flickering, unnatural light. She wanted to rationalise the experience, to understand it and thus make it acceptable, but so far there was no explanation for what had occurred. Dwelling on this, feeling worse, a sense of unreality invading her, she turned a corner at the end of the corridor, went through another doorway, and entered the small reception room outside the psychiatric ward.

‘You look terrible, young lady.’

‘I’m not young,’ Kate replied.

‘You’re too young to be looking as you do, so confess to your sins.’

Kate didn’t reply, feeling too weary for idle banter, merely standing there and staring past the reception desk at the old Jew and the medic. They were at the door of the ward, the tall Jew with his head bowed, the Arab removing his finger from the doorbell and glancing back with pained eyes. Kate felt sorry for him, understanding what he must be feeling. She smiled at him and he responded, his eyes luminous with gratitude, then he looked up at the silent old Jew as the ward door swung open.

‘I don’t think he’s too bad,’ he said. ‘The shock… it will pass.’

The male nurse who had opened the door stepped aside to let them in, closed the door behind him, locked it and pocketed the keys, then turned around and waved his hand, indicating the shocked and grief-stricken survivors of the recent explosion.

‘They’re still hysterical,’ he said. ‘Two of the women are really bad. I think the rest will just need temporary sedation, but we haven’t given them anything yet.’

Kate glanced around the ward, a small room with eight beds, sunlight pouring in through barred windows onto white-painted walls, making the steel bedrails shine. Two of the women were lying down, still fully dressed, wailing loudly, one of them having her forehead stroked by a bearded zealot, the other surrounded by relatives or friends. A young Orthodox Jew, at the far side of the room, was repeatedly kissing his prayer book and rocking from side to side while murmuring a repetitive litany. The other survivors were less affected, though obviously not that well, either wandering about or staring around them in a daze, sometimes reaching out to embrace one another, weeping quietly and shaking.

‘Make them all lie down,’ Kate said. ‘I don’t want them walking about. We’ll probably need some chlordiazepoxide and meprobamate. I’ll be back in a minute.’

She didn’t know what was happening to her, but she felt the need to escape, wanting to rid herself of her patients and the demands they would make upon her, and aware, as she walked to her office, that she was losing control of herself. Nurse Jabotinsky hurried after her, always faithful, ever watchful, reaching out to touch her encouragingly on the shoulder as they entered the office.

‘I know,’ she said. ‘It’s terrible. All these bombings are too much. And

you… just look at you, poor child, you've had far too much work… And now this… and your father.'

Kate ignored the last remark, refusing to accept the truth of it, still not knowing if she was shocked by her father's death or by the possibility that she simply didn't care. What was grief, after all? It was the disease she was supposed to cure. Psychiatrist, she thought, heal yourself or accept that you're worthless. She sat down behind her desk, covered her face with her hands, massaged her tired eyes with uncertain fingers and then looked up at Nurse Jabotinsky.

'I don't care anymore,' she said. 'I think I might even despise them. I'm tired of the sick and the maladjusted and the shell-shocked. I feel nothing but revulsion at the sight of them. I want to scream. *I don't care anymore!*'

Nurse Jabotinsky smiled and nodded, obviously not believing a word of it, putting it down to the emotional exhaustion wrought by the recent spate of bombings and the death, also recent, of Kate's father.

'You're drinking too much,' she said. 'It's the influence of that Leon Halcomb. More Vitamin C is what you need, and that man won't provide it.'

Kate had to smile at that as well, amused that Jerusalem held no secrets, then she sighed and placed her hands on the cluttered desk, gazing down at the papers. 'You attend to them,' she said. 'I'm sure you know what to do. Sedate them if necessary and I'll have a talk with them when they're pacified. I'm not up to it right now.' The nurse nodded understandingly, unclasped her hands and turned to leave, but before she reached the door it swung open and Lieutenant Frankel marched in.

'Don't you know how to knock?' Kate said acidly, wanting someone to whip.

'My apologies,' the lieutenant said, touching his moustache with a restless finger, his skin dark from the sun, his gaze darker and fixed steadily on Kate. 'I would remind you, however, that I have certain responsibilities in this matter.'

'That sounds pretty pompous, lieutenant. What do you want?'

'I've been sent personally by Major-General Moshe Eitan - '

'I'm not interested in who sent you, lieutenant. I want to know what you want.'

The lieutenant, who was not used to being talked to in such a manner, least of all by a woman, flushed with anger and tried to keep his gaze steady.

‘I want tape-recordings of everything that’s said between you and those survivors during their forthcoming psychiatric counselling.’

‘You sound like a tape-recording yourself.’

‘I didn’t come here to be abused by your notoriously sharp tongue. I repeat: I want your tape recordings.’

‘You can’t have them.’

‘I demand them.’

‘No,’ Kate said icily. ‘I’m entitled to protect the confidentiality of my patients.’

‘It’s a matter of security,’ Lieutenant Frankel said, contempt creeping into his voice. ‘We need to know who bombed those people. The survivors might mention things that could be important, so we need to hear everything.’

‘Find out some other way.’

‘There *is* no other way. You’ll be talking to those people when they’re dazed or in shock, and what they might unwittingly reveal to you could be of great value to us.’

‘I’m not interested, lieutenant. I won’t betray the trust of my patients, and that’s all there is to it.’

‘To save your precious American conscience, I won’t *ask* you, Dr. Hirschfield. Instead, I will make it an order. You *will* pass on your tapes.’

Kate suddenly exploded, almost rising out of her chair, all her recent resentments and fears finding release when she banged her fist hard on the desk and glared at the shocked Lieutenant Frankel.

‘Damn you!’ she yelled. ‘Get the hell out of this office! I can’t stand your pompous patriotism and devotion to duty. Those people outside are *suffering*! I can’t help them unless they *trust* me! I will *not* abuse that trust by becoming a spy for the IDF, so go back to Shin Bet, to your paranoid friends, and have me turned in as a traitor. You understand, lieutenant? I’m telling you to go to hell. If you want to interrogate those people, you can do it when I discharge them - but until then keep your nose out of here and don’t bore me with platitudes. Now get the hell out of this office and close the door when you leave.’

The lieutenant straightened his shoulders, took a deep breath and glared at Kate, then turned and marched angrily out of the room, pointedly leaving the door open behind him. Kate glared at the open door, then let her breath out in a sigh and sank back into her chair. Shaking her head wearily from side to

side, she let the anger drain out of her. Nurse Jabotinsky cleared her throat, nodding her head automatically, then a smile illuminated her matronly face as she placed her hands on her hips.

'You still care,' she said.

'Perhaps,' Kate replied. 'Either way, the work has to be done, so let's go see our patients.'

They both walked out of the office and into the ward where the women were still weeping dementedly, the men murmuring prayers. Kate stared at them, mesmerised, deeply shocked by the familiar: the most extreme face of Israel as represented by those bereaved, stricken zealots.

The women had shaven heads and wore kerchiefs over their wigs, having given up the right to retain their attractiveness when they married their extremely pious men. The men were anachronisms, beards and fringes untouched by scissors, their breeches tight around the knees; their faces, deathly white beneath their wide hats, framed in long ringlets. These men lived for the Torah while their wives remained invisible, only recognised in secular matters - birth, marriage and death - and only allowed to shed tears while their men, all important, communicated directly with their God. It both appalled and angered Kate, made her feel that time had stopped, and that this land, the Holy Land, drenched with blood and dreams of freedom, was a land so totally devoted to its men folk that its women were ciphers. Kate couldn't take it much longer - her American soul was in revolt - and as the women continued wailing and the men kissed their prayer-books, she surrendered to shame and outrage, feeling alien and ostracised.

'I'm still an American,' she said obliquely. 'I'm just beginning to realise that. This country and I don't belong together and should never have met.'

'You're just tired,' Nurse Jabotinsky told her.

'Maybe. I hope so… But somehow I don't think it's true. I feel as if I'm drifting away and losing sight of these people.'

'Innocent fools,' Nurse Jabotinsky said, as if not quite hearing Kate. 'They can't even accept Israel. They still wait for the coming of the Messiah and think we've denied Him. What can we say to them?'

'Nothing,' Kate said. 'Just look at that old man. He's just lost his son and he's shocked, but his faith is intact.'

Kate wanted to go up to him and console him in his loss, but the old man, an anti-Zionist, member of the Netorei Karta zealots, obviously stunned by

the loss of his son, doubtless shocked beyond measure, nonetheless raised his head, touched his lips to his prayer book, and then, his eyes tearful, his hands shaking with emotion, placed the frontlet on his forehead, wound the *tefillin* around his left arm, and quietly buried his grief in the soil of his unyielding faith by praying fervently that the Messiah might come and establish the true Promised Land.

Kate was filled with despair.

4

‘I came here to talk,’ Rashid Idriss said, his voice soft and his English precise. ‘Not to fight; just to talk.’ They were in the new guest chamber, an austere, modern room, enlivened only by the Chagall tapestries that dominated one wall, the three of them in chairs at the end of the long table, Rashid and Moshe Eitan face to face, the Prime Minister between them. ‘The situation is getting out of hand,’ Rashid continued, ‘and I don’t think any of us wants it to worsen. That’s why I’m here.’

Moshe, leaning lazily back in his chair with one large hand stretched out on the table, tapping a pencil up and down on the polished wood, studied Rashid with a gaze neither friendly nor antagonistic, though it *was* deliberately unreadable. Rashid, knowing Moshe’s history, was not fooled by the neutral look, if not certain at least willing to accept that it might conceal hatred. Likewise, the Prime Minister, Ben Eleizer, an old fox with a sweet face, now leaning forward casually, his elbows on the table, his shirt sleeves rolled up, the shirt unbuttoned at the neck, looking like a simple member of the *kibbutzim*, his gaze deceptively mild and inoffensive.

‘The situation is getting out of hand,’ Moshe said, ‘because you, Rashid, and your terrorists are murdering more Jews every week.’

Rashid imperceptibly tensed and then forced himself to remain calm. Replacing his brief flash of anger was a vision of a Palestinian refugee camp in south Lebanon: dogs barking at Land-Rovers with machinegun mountings instead of seats; the young men in fatigues, bearing rifles and pistols, posing proudly under posters of Yasser Arafat, the posters tattered and bleached by the sun that blazed down on the dispossessed… And most of those dispossessed souls had originally fled from Galilee.

‘I did not come here to hear talk of Arab terrorists and murderers,’ Rashid said. ‘You can try giving that to your Western newspapers - though I doubt that even they, in their growing disillusionment with Zionism, would bother

chopping wood to get it printed.'

Moshe smiled at him, without warmth, with respect, while the Prime Minister, his elbows still on the table, nodded sleepily.

'Very good,' he said. 'Your reputation preceded you. We have heard of your excellent English education and talent for oratory… Now the proof has been offered.'

Rashid leaned forward in his chair, placed his hands on the table, looked directly at the Prime Minister and Moshe, his calmness concealing his anger.

'I risked a great deal to come here,' he said. 'I'm sure you both understand that.'

'We risked a great deal in letting you come,' Moshe replied. 'A fact I am sure *you* appreciate.'

Rashid just smiled at that, still suppressing his anger, keeping his head clear, silently saying thanks to Allah for his excellent education and what it had taught him about fighting with words.

'My terrorist murderers,' he said, 'are increasing their activities because the situation on the West Bank has become intolerable and their patience is running out.'

'The West Bank?' the Prime Minister replied, his mild eyes histrionically surprised.

'Such innocence would be touching, Ben Eleizer, if it were also convincing.'

The Prime Minister glanced at Moshe, smiled slightly, then lowered his gaze to the table. 'So, Mr. Idriss, what is this question about the West Bank?'

'You know about the West Bank, Shlomo Ben Eleizer. According to the Camp David peace agreement of 1979, Palestinians were to be granted a degree of self-government on the West Bank. For the past eight years, however, with the tacit agreement of Mr. Begin and the further connivance of every Zionist politician, the Jews of Kash, *Gush Emunim* and Netorei Karta have taken over practically the whole of the West Bank. They are now systematically driving most of the remaining Arabs away, by violence as often as not, determined to remove every last Palestinian from the area. Since your own government has done nothing about this, it seems increasingly clear that your intention is to ensure that ultimately there will be no Arabs in Palestine at all… I cannot control my men much longer, Ben Eleizer. They will not sit back and watch passively as the Jews rob them of the little they

have left in their own homeland.'

'This is the *Jewish* homeland, my friend.'

'The Balfour Declaration did not represent the word of God or Allah. You are here, Ben Eleizer, and I must accept that you will remain, but I cannot accept that Palestinians can have no say in this land.'

'Israel is open to those Arabs who accept Jewish rule.'

'No, Ben Eleizer, it is not. You have your Wailing Wall, but it hasn't satisfied your greed; now you have the Temple of the Mount as well, and soon you'll have the whole of the West Bank. As for Arab freedoms, it has long been perfectly clear that the Arabs of the occupied territories are being deprived of their rights, robbed of their homes, and systematically driven out to rot in the refugee camps of Lebanon and Syria. This is as true today as it was back in 1917 when our fine British friends sold us out by kissing the feet of Chaim Weizmann. You stole from us then, and you continue to steal from us today - so don't tell me this land is open to the Arabs.'

'Are you suggesting that we do nothing to defend ourselves against your assassins and bombs?'

Rashid stared at Moshe, studying his unfathomable grey gaze, but finding nothing either there or in his laconic smile to suggest the slightest weakness. 'Freedom fighters are not necessarily assassins,' he said quietly, 'and your own bombs have not fallen unnoticed. What I am suggesting, Moshe Eitan, is that your so-called acts of reprisal are in reality but part of a systematic drive to rid this country of genuine Palestinians.'

'Not true,' Moshe replied levelly.

'I'm afraid it is, Major-General.'

'We could argue about it all afternoon,' the Prime Minister said. 'Alas, it will get us nowhere.'

Moshe continued to lean back lazily in his chair, casually tapping his pencil on the table, his gaze calm and perceptive. This was not the first time that he and Rashid had met; nor was it the first time that Rashid had found himself wondering just what attitudes were concealed behind Moshe's hooded eyes. It was no secret that Moshe believed completely in preserving Palestine for the Jews; what had never been ascertained, even by Arab security, was the actual extent of that commitment. On the one hand, a man who had good reason to hate Arabs, Moshe was, on the other, a man who more than once had displayed a certain understanding of the Arab grievances;

one who had trodden a fine line between the dedicated Zionists and those who believed that Arab assimilation was essential to Jewish survival. Moshe was clever, and had eluded the spleen of successive governments, but Rashid was not alone in often wondering just where his sympathies really lay.

'Settlement of the West Bank,' the Prime Minister said eventually, 'has not been a deliberate policy of this government.'

'But you sanction it.'

'Not so. Settlement of the West Bank may have been encouraged by Menachem Begin, but it is desirable neither to the majority of Jews nor to me. Settlement of the West Bank has been made, without our consent, by the members of Kash, *Gush Emunin* and, recently, the more fanatical members of the Netorei Karta sect. Now, as you well know, most of those Jews are as unreasoning as the most pious of Muslims, so nothing we can say to them will make them move. It is their belief that God gave Jews the right - or, as they're more likely to put it - the holy duty to live on the West Bank, and successive attempts to persuade them to leave have proved to be fruitless.'

'You underestimate the situation, Ben Eleizer. First deprived of the Temple of the Mount - one of the most sacred shrines for all Muslims - my people are now being forced out of Hebron, one of Islam's most holy cities. Even as they protest against this, they are being systematically harassed by your soldiers and assassinated by Kash and *Gush Emunin* all over the West Bank - in Ramallah, Nablus, Hebron and Kiryat Arba, with the latter town now practically an armed fortress, controlled by those thugs you call Orthodox Jews.'

'We have never sanctioned such activities,' Moshe said.

'Nor have you tried to prevent them,' Rashid replied.

'We have a problem there,' Moshe said. 'You understand that problem perfectly. Only removal by force would clear those Jews off the West Bank - and neither politically nor morally can we afford to do that.'

'Morally?' Rashid said. 'And you think it is moral for the Arabs to be forcibly removed from their last foothold in Palestine?'

'They are not being forcibly removed,' the Prime Minister said.

'They are being *forced out*, Ben Eleizer.'

'I repeat: it is *not* government policy.'

'And I repeat: you cannot let it continue. If you do, I will be unable to control my men.'

‘Let *me* repeat,’ Moshe Eitan said, ‘that you are hardly controlling your men now. They’re crossing our borders in increasing numbers, planting bombs, ambushing soldiers, attacking innocent civilians and then boasting about it from the safety of Lebanon or Cairo. The situation is, as you say, getting out of hand, but things will not get better until you still the activities of your so-called freedom fighters.’

‘Honour the Camp David agreement before asking me to cool the ardour of my men.’

‘Gentlemen! Gentlemen!’ the Prime Minister exclaimed, waving his small, fine-boned hands. ‘We are at an *impasse*.’

Moshe placed his pencil back on the table, took a cigarette from the packet in his tunic pocket, lit it from a soiled box of matches, then blew a cloud of smoke to the room, his normally cool gaze, now fixed on Rashid, glinting with what might have been anger.

Anger or hatred? Rashid couldn’t be too sure. Eitan had good reason to hate him - to hate all Arabs on principle - and if such were the case, Rashid could certainly understand it. Yet even as he thought this, and felt a latent sympathy, he had a recollection of a similar case, one of a singularly intimate nature, frozen in a not so distant past and kept alive to sustain him… An Arab child awakening in the chill dawn of south Lebanon, awakened by the droning of aircraft… then the droning becoming the shrieking of jets, other catastrophic noises, his mother and father screaming, his sister weeping, all fleeing their beds… then mushrooming dust, fierce heat and flames, the walls collapsing around them with a roar… More images: the village street, the grey light filled with smoke, the men and women racing to and fro as the bombs blew their homes apart… Then silence. Swirling sand. The dust settling over the dead. And his father pointing up, his finger shaking, to a sand-covered ridge… Instant fear. A feeling of unreality. Stunned disbelief… A long line of troop carriers, the soldiers spreading along the dunes, silhouetted against the sand’s brilliant whiteness, moving down towards the village… The child’s father praying to Allah, the wind slapping his words back. The guns roaring and people wailing and falling, men, women and children… Death. Devastation. Another silence filled with sobbing. The child clinging to his mother, now dead, as was his father, the blood splashed on them both and on his sister, spread-eagled, no more… This bleak vision dissolved, became a glaring white sun which then shrank and

became the light bulb above Moshe Eitan's head… Moshe Eitan: a Jew. And like Rashid: without a family. So many in Palestine, Jew and Arab alike, were forced to live with the loss by violent death of someone they had loved. In this, as in their passion for Palestine, they had something in common.

'So,' the Prime Minister said, raising his hands in a desultory gesture, 'you've come here to ask us to remove our most fanatical Jews from the West Bank, if necessary by force. I tell you, Rashid Idriss, that we cannot do it. We cannot pit Jew against Jew.'

Rashid glanced briefly at the silent Moshe Eitan and then, leaning forward, clasping his hands together, fixed his gaze steadily on Ben Eleizer.

'I think you'll have to,' he said.

'Oh? And *why* will we have to?'

'Because, Ben Eleizer, Jew is *already* fighting Jew – and it will get worse if you don't do something about it.'

'I don't know what you're talking about,' the Prime Minister said, his mild eyes as innocent as a child's, concealing his tension.

Rashid couldn't resist smiling, his amusement briefly defeating his anger, now aware that he had struck a delicate nerve and must not let it go.

'You know what I'm talking about. Both of you - you know. The settlers of the West Bank, which they call Judea and Samaria, are doing what they want because they believe that no Jewish government will use its conscript troops against fellow Jews who claim to be exercising their ancient biblical rights. So far this has been true, but since, in the last few years, settlement of the West Bank has become such a blatant violation of the Camp David agreement, it has outraged not only my people but the whole Western world, filling the majority of your Jews, conservative and anti-Zionist, with foreboding, and placing you in an unpleasant dilemma. Yes, already aware that both Jewish and international opinion might force you to attempt to clear the West Bank with your troops, the settlers, prepared to die for their beliefs, have turned their towns into fortified camps, with bunkers, minefields, heavy machineguns, armoured vehicles and anti-tank missiles - and although they pretend that this extraordinary wealth of hardware is there merely to combat the odd Arab freedom fighter, one of their leaders has publicly proclaimed that the security of the West Bank is more important than the constitution. You are, in short, on the brink of civil war - with Jew prepared to kill Jew.'

'That's not true,' Ben Eleizer said.

But Rashid knew that it was. While it was true that his Arab freedom fighters had increased their raids into Palestine, it was equally true that they only came in small numbers, carrying no more than hand grenades, small explosives or rifles for ambush. There was therefore no logical explanation for the fortified gates, heavy security and massive arsenals of the West Bank, other than the one Rashid had offered - and that explanation was original neither to Rashid nor the majority of conservative Jews of the occupied territories. The fortified towns of the West Bank, run by Jews, were designed to combat the potential threat of Jewish government forces. Rashid, studying Ben Eleizer and Moshe Eitan in turn, knew that they both understood this fact.

'It's true,' Rashid said, 'and you know it.' He waited for a moment to let his words sink in, and then asked them the one question that he knew they both dreaded to hear. 'Who planted the bomb in the Mae Shearim quarter?'

Neither Moshe Eitan nor the Prime Minister displayed the slightest physical reaction, but something almost imperceptible flashed between them, and Rashid knew that his question had struck home.

'Since you already know about the bombing,' Moshe Eitan responded, 'it was obviously planted by one of your own men.'

'Not so, Major-General.' Rashid kept his voice calm. 'Some of your more fanatical Jews are now convinced that eventually you will have to force them off the West Bank and they're willing to assassinate any prominent Jew who supports that idea. Indeed, even now, some of those Jews are trying to topple your government. The bomb that exploded in the Mae Shearim quarter was meant to kill Rabbi Nachman, a moderate Orthodox Jew concerned by the increasing number of Netorei Karta zealots who are disowning the Zionist State and consorting with Arabs. Ironically, that bomb, planted by a Netorei Karta zealot, merely killed one of his own kind.'

'And the West Bank?'

'You know your options on the West Bank, Ben Eleizer. The West Bank is now controlled by fanatical Jews who fear and despise their own legitimately elected government. Sooner or later, due either to outside diplomatic pressure, negative reactions from your own electorate, or the threat of all-out war with my people, you will have to return autonomy to the Arabs. Your Jewish fanatics won't move, so you will have to use your own conscript troops - Jew against Jew.'

‘That’s our problem. I still don’t know what you’re driving at.’

‘What I am saying, Shlomo Ben Eleizer, is that if you do not remove those Jews from the West Bank soon, when it would be relatively easy to do so, you will have to do it later, when the fanatics will have increased dramatically and will be in a position to start a civil war. Once that happens - when Jew is busy killing Jew - it will be impossible to prevent my people from trying to exploit the situation; and then, Allah forbid, the Russians and the Americans will have their excuse for the so-called War of Intervention that they both want so badly. In the name of world peace, the Soviet Union and the U.S. will then police all of Palestine, and neither Arab nor Jew will have a say in it. I come here, then, for both our sakes… This problem has to be solved.’

Now, while Rashid removed his hands from the table and sat back, much too casually, in his chair, it was the turn of Moshe Eitan to lean forward, his thick arms on the table, and stare at Rashid with his unrevealing, probing eyes. Rashid did not avert his gaze, but stared boldly back, his lips tight, until Moshe, with a slow, heavy sigh, raised his hands in despair. Then Rashid glanced quickly at the Prime Minister and saw his interlocked fingers.

Just that - the white knuckles - an acknowledgement of what had happened here.

An Arab had come to the Knesset and voiced the unspeakable.

5

It was late in the afternoon when Kate walked into the Jerusalem Intercontinental Hotel on the summit of the Mount of Olives and saw Leon Halcomb at his usual table in the Seven Arches restaurant, drinking whiskey, smoking a cigar, and gazing distractedly down upon the Old City. Walking up to the table, Kate noticed that Leon was, as usual, very dapper in his pinstripe suit and white shirt and tie, his cufflinks gleaming, his black hair neatly combed, his face flushed and looking healthier than he probably felt. When Kate reached the table, Leon glanced up and nodded, crow's feet around his bloodshot, restless eyes, his lips, which were thin, overtly sensual, covertly ascetic, forming a quick but oddly self-mocking grin.

'Ah, my lovely Kate, my darling psychiatrist, did you have a good day?'

'Obviously you've already heard.'

'An excellent day for journalists, Miss Hirschfield. Bombs are always good copy.'

'I can do without that sort of low joke.'

'A mere slip of the tongue, Kate.'

Kate smiled in acknowledgement of the patent lack of sincerity, then set her shoulder bag on the table and sat down facing Leon.

'I'm a very weary woman this evening.'

'A gin and tonic?'

'Why not?'

A resident of the hotel, Leon had no trouble in finding a waiter and getting Kate her drink. Kate had an appreciative sip, then lit a cigarette and sat back in her chair, feeling exhausted, both physically and emotionally. Looking down the slopes of the Mount of Olives, which were bathed in dimming light, she saw the archaic splendour of the Old City, the gold-and-silver domes still majestic. Then she slowly raised her eyes, unwillingly, almost fearfully, and saw the blue sky growing darker, streaked with drifting

grey clouds. The stars were not out yet. Kate shivered, feeling relief. She dropped her gaze and stared at Leon who was holding up two tumblers, topping up his fresh whiskey with the remains of the previous one, his lips puckered, one eye focused on the rim, the cigar still in his right hand.

'How long have you been here?' Kate asked him.

'I'm *always* here, Kate. I am, as you know, more or less a permanent resident, treated with the required condescension by the excellent staff.'

'I don't know how you stand it.'

'Hotels are very pleasant, both spacious and anonymous, God's gift to the non-domesticated man who carries only a suitcase.'

'Let me rephrase my question: What time did you get out of bed?'

'In time to cover the bombing in the Mae Shearim quarter and telex such information as was gathered to my superior beings in Washington DC - but quite a long time after you left me.' He finished topping up his fresh glass, then had a drink and licked his thin lips. 'Naturally I could only write about the casualties,' he added, 'but perhaps you will now inform me about the survivors.'

Kate smiled. 'No.'

'What a loyal Jew you are. I said it before and I stand by it: you're a real little *bubeleh*.' He grinned and inhaled on his cigar, his restless eyes roaming around the restaurant, then exhaled a cloud of smoke and reached out for Kate's hand. 'Seriously,' he said, 'you don't look too good.'

'I'm just tired,' Kate replied, remembering the events of the early morning, still uneasy but not wanting to discuss them, already doubting her senses. 'Too much sex, too much drink. Then, after the chaos in the hospital, an old friend paid a visit. He informed me that you're a very bad influence - and that made me wearier.'

'I won't ask you who said that about me - but, of course, he or she was quite right.'

'It was Rabbi Latinavots.'

'Ah,' Leon said. 'Our acting Ashkenazi Chief Rabbi. A nice man, but an old friend of your father's, so that could explain it. Also, he has a few problems of his own - the usual quarrels with the Sephardi Chief Rabbi, the customary disagreements with the Council of Torah Sages, the day by day headaches of the Rabbinic Court of Appeal - so it's possible that his nervous system has been shattered and he needs someone to horsewhip.'

‘His nervous system is fine - and he *does* have a good reason to detest you.’

‘Me? But I’m not even Jewish. Hardly more than a *tourist*.’ Leon sipped some more whiskey, his public-schoolboy face mocking, the cigar thrusting up from the fingers that stroked the back of Kate’s wrist. ‘So, Kate, how did the rabbi describe me?’

‘You want the brutal truth?’

‘I’m a masochist.’

‘You’re a cynic, a drunkard and an anti-Semite.’

‘That sounds quite reasonable.’

‘He really doesn’t like you.’

‘That’s because I’m always proclaiming loudly in print that this country is being divided by religious bigotry and the demented ravings of the chief rabbis, the Rabbinate, the Council of Torah Sages, and other likewise antiquated bodies. This has not helped to make me the most popular Gentile in Jerusalem, but it *has* made me a reasonably respected journalist.’

‘An unsavoury breed.’

‘True.’

‘The word is out that if you continue to write your anti-Zionist articles, a certain Major-General Moshe Eitan may have you thrown out of the country.’

‘I doubt it,’ Leon replied, inhaling on his cigar, exhaling blue smoke. ‘The venerable Chief of Staff is too aware of the negative shift in worldwide opinion.’

‘I’ve heard the very opposite: that Eitan is as stubborn as a mule, ruthlessly efficient, and doesn’t give a damn what anyone thinks of him.’

‘Ruthless and stubborn he certainly can be - but he’s also an astute diplomat. Bear in mind that Eitan is one of those legendary Israeli warrior-heroes with a history of personal tragedy and public glory. Born and raised on a kibbutz, noted fighter in three wars, wife and children murdered by Arab raiders, then leading light of the military command… Not, then, a great lover of his restless Arab neighbours, he is, nonetheless, a politically aware military man who has, more than once, cooled the ardour of the more aggressive members of the IDF. Ergo, while it’s true that Eitan detests my widely syndicated and extremely popular column - and please note the shameless self-advertisement – it’s also true that he’s not the sort of fool to seal the lips of a foreign journalist and invite the wrath of the democratic

countries.'

'A situation you exploit to the hilt, being thoroughly devoid of normal scruples.'

'Scruples are for the likes of Moshe Eitan. Israel's juicy hypocrisies are *my* game.'

'What hypocrisies?'

'You may further your education, sweet lady, by simply reading my columns.'

He grinned wickedly at Kate, removed his fingers from her wrist, then sat back in his chair and looked down at the walls of the Old City, after which he turned his gaze back to Kate, his blue eyes now even more bloodshot. Studying his eyes, which, though red with drink, were still bright with intelligence, Kate again found herself filled with a premonition of disaster, the feeling that Leon, hiding behind his cynical wit, was twisting slowly on the blade of self-contempt and unstated pain. Possibly he gauged what she was feeling - or at least sensed her lack of joy - for he now crooked his head, squinting at her with one eye, and offered a bright, encouraging grin.

'The lovely lady is not herself tonight.'

'No, I suppose not.'

'The cries of the bereaved in the hospital?'

'Yes… I'm fed up with it.'

'All psychiatrists go crazy in the end.'

'I won't argue that point.'

'Your father's dead, Kate. You have no one left here. Why don't you simply pack up and leave? Go back to America.'

'I don't know… that's the question.'

'Your Jewishness?'

'I don't think so. That's not what holds me here. In fact, I think it's the fanatical Jewishness of this damned country that's driving me crazy. I'm only Jewish by birth. My father's beliefs never touched me. I'm American and I feel it to my bones and this country defeats me… No, I think I've just been here too long to ever go back… I'm too old for a new life.'

Yet that wasn't the truth, since recent events had confirmed the opposite: first the dreams, then the strange star, then the earth tremor and flickering, unnatural light, then the fear that had dogged her through this day and drove her out of the hospital. The buried shame of her past? A premonition of the

future? Whatever their source or reason, the events had opened a chasm beneath her. An only child, she had missed her mother, who had died five years ago; but the death of her father, for whom she had felt no great affection, had torn her from the anchor of her past and then cast her adrift. Now, more than ever, she felt a foreigner in this country, isolated, confused, ostracised by its contradictions, wanting desperately to escape back to America, but too frightened to move. That fear, more than anything else, filled her long nights with shame.

'Too old,' Leon said. 'That explanation rings hollow. More likely the legendary magic of Judaism has rendered you senseless.'

Kate couldn't resist smiling. 'I don't think so, Mr. Halcomb. Your notorious disrespect is contagious and has turned me into a sinner.'

'Is that what they say?'

'Gossip always returns to its source. It's possible that I said it first, but now I'm branded for life: a thirty-five-year-old spinster, sharp-tongued, anti-Zionist, who drinks too much and sleeps with Leon Halcomb, a dissolute English anti-Semite.'

'A very pretty picture that conjures up.' Leon grinned and held his glass of whiskey high, as if offering Kate tribute. 'But tell me, dear,' he said, having a sip, putting his glass down, 'how did a nice girl like you end up with this pagan?'

'That's another question I've often asked myself.'

'But that isn't an answer.'

Leon's eyes, blue and bright, streaked with red but still sharp, studied Kate with a thinly disguised intensity that made her uncomfortable. Perhaps that was the answer: Leon's mockery revealed the truth; Leon's cynicism, with its grasp of the ridiculous and hypocritical, was a knife that stripped the flesh from the bones to show the poison beneath. The poison was life itself, its private dreams and public dramas, just as much a part of Kate, with her need to bury her guilt in work, as it was a part of Israel with its dream of freedom drenched in blood and its faith in the Messiah kept alive by the roaring of guns. The ridiculous and the hypocritical, both in public and in private: perhaps Kate was drawn to Leon because his lack of faith was comforting, his realistic view of life's horrors a rebuke to her own growing doubts.

'Yes,' she said, 'I want to leave. At least I *think* I want to leave. I no

longer like my work, the woes of my patients now depress me, and I keep thinking that I don't belong here, that my life is slipping away from me. Maybe it's just my age, my father's death, the empty house; something stupid like the fact that I'm not married and don't want to be; but that I, the psychiatrist, in my supposed wisdom, secretly dread the thought of being alone. I don't know if that's true. If it is, it's detestable. Nonetheless, I'm running scared, feeling alone, yet keeping my distance; not wanting to be involved, yet feeling hungry for some kind of commitment. I'm in conflict with myself. I'm beginning to behave like my patients. The truth is that I'm no longer a good psychiatrist. I'm just a woman… and stupid.'

Leon smiled and stubbed his cigar out. 'You have the premature, middle-aged blues,' he said. 'Not the stuff of the sabra.'

'No, not a sabra. Not even a good Jewish girl. I have strange dreams at night - about you and the rabbi, about my father and my past - and those dreams, perhaps more than anything else, make me want to leave Israel.'

'Your past?'

'Various skeletons. Long buried in various closets. I'm sure a man with your low boredom threshold wouldn't want to discuss them.'

Leon proved that point by turning his head and nodding at the waiter, who soon arrived with two more drinks and just as quickly departed. Leon raised his glass to Kate, then nodded again and took a sip, while Kate, recalling the events of the early morning, looked out at the sky: velvety blue turning darker, streaked with faint lines of crimson, aureoles of grey light around the clouds as the evening descended. There was nothing unusual there, and Kate wondered if there ever had been. She shivered, feeling unreal and nervous, then turned back to Leon. He was stretching himself and gazing around him, studying the tourists at a nearby table, a small, mocking smile on his lips, shadows under his eyes.

'And why a disreputable character like Leon Halcomb? That question hasn't been answered yet.'

'I told you,' Kate replied. 'I'm just a woman… and stupid. Also, I'm trying to keep my distance - and you're helpful that way.'

Leon's eyes, always alert, one eyebrow raised, turned back to fix on Kate's face. '*I'm* helpful? How come?'

Kate stubbed her cigarette out, lit another immediately, then glanced up at the darkening sky. It was, at least as far as she could see, devoid of unknown

phenomena. ‘Because you’re sweet,’ she said. ‘Because beneath it all, you’re soft. Because for all of your cynicism, you’re neither aggressive nor demanding and, believing in nothing, don’t stand in judgement. I think that’s what it is. You don’t expect anything from me. I can come and go as I please and you never complain… because you don’t give a damn.’

Leon looked interested. ‘And that’s what you like about me? The fact that I don’t give a damn?’

‘That’s it. That’s your answer.’

Leon raised his right eyebrow, ran his fingers around the rim of his glass, glanced distractedly left and right, his grin bemused, before returning his gaze to her.

‘I’m not sure I understand, Kate.’

‘It’s really not very complicated. Not wanting to possess or *be* possessed, I feel safe with you. It’s your inability to stake a claim on anyone that makes you attractive.’

‘My inability to stake a claim?’

‘Come on, Leon, don’t act innocent…You’re a married man, two children, separated from your wife, and, by your own admission, separated because you couldn’t stand home life. Now you travel the globe, carrying no more than your suitcase, hopping in and out of beds in impersonal hotel rooms, feeling comfortable with no place to call your own, with no lasting relationships. You and me, we’re both the same that way, which is why we get on so well. We’re both wary of involvement, of more than superficial experience, and we both look at life from the distance of supposed objectivity. You have your journalism – the unprejudiced eye, the clear ear – and you pretend to take no sides, to report only what you see and hear, and in this way you deny your own involvement in life’s irrational passions. Unfortunately, it’s a lie. Objectivity doesn’t exist. What you see and hear are filtered through your own emotions - and it’s this, the realisation of your weakness, that you hide with your wit. That also explains your suitcase and hotels and Kate Hirschfields: they’re all part of an impersonal world - a world of comfort, but twice removed - and you can take them or leave them as you wish, but they won’t draw you in. Your need for disengagement isn’t threatened - and that helps you feel comfortable.’

‘And Miss Hirschfield?’

‘Miss Hirschfield is in psychiatry, another supposedly objective field, but

psychiatry, like the farce of journalism, weaves its own sly deceits. Miss Hirschfield also analyses with her eyes, ears and brain, breaking down the thoughts of her patients, often complex beyond imagining, into patterns of words that presume to define the psyche in logical terms. In doing this, she must play a game, the game of human objectivity, a pretence of reason and understanding that transcends psychic chaos. A transparent hoax? Possibly. Yet it often works with the patients. Unfortunately, it also works with Miss Hirschfield, but in a negative way. Like Mr. Halcomb she fears involvement, seeks the safety of distance, and thus psychiatry, which insists upon a so-called objectivity, becomes the wall behind which she can hide…We are two of a kind, sir.'

Kate picked up her glass, swallowed a mouthful of gin, put the glass down and inhaled on her cigarette, breathing deeply and nervously. The restaurant was now more crowded, the conversations louder, and outside the first stars were appearing in a sky of dark velvet. Kate looked up, scanned the sky, saw nothing unusual, sighed with relief and lowered her gaze to stare straight at Leon. He lit another cigar, exhaled a thin ribbon of smoke, then placed the cigar on the ashtray and leaned over the table.

'Why Miss Hirschfield's fear of involvement?'

'I will never discuss that.'

'And what makes you think I'm not involved with you?'

'Don't even suggest it.'

They stared at one another, their faces close, neither smiling, held together by the sealed doors of their past and the words still unspoken. Then Kate turned her head, wondering what she had said, and saw the darkened Valley of Kidron, the blackened domes of the Old City, the spotlights beaming up through the palm trees and illuminating the limestone walls. Down there were the twisting lanes and Oriental *souks* and covered passageways, the Orthodox Jews and Franciscan monks, the Muslims in flowing robes and *keffiyes*, the nuns in their habits, the Bedouin women in their embroidered dresses, the young soldiers with their machineguns on their shoulders, all the stalls and bazaars. The Old City… a mirage. Kate's heart broke at the very thought of it. She looked up at the sky, saw the stars, all familiar; then stared back at Leon to see his blue eyes and thin lips - no smile, not the trace of a grin as he leaned closer to her, his voice low and passionate.

'Come to bed, Kate. *Now*!'
